lookatme is an interactive, terminal-based markdown presentation tool that supports:

- Themes
- Syntax highlighting
- Styling and settings embedded within the Markdown YAML header
- Embedded terminals as part of a presentation
- Live and manual source reloading
- Contrib extensions
- Smart Slide Splitting

CHAPTER 1	

Tour

4 Chapter 1. Tour

CHAPTER 2

TL;DR Getting Started

Install lookatme with:

pip install lookatme

Run lookatme on slides written in Markdown:

lookatme slides.md

Slides are separated with --- hrules:

Slide 1 Some text --# Slide 2 More text

A basic, optional YAML header may be included at the top of the slides:

```
title: Slides Presentation
author: Me Not You
date: 2019-12-02
---
# Slide 1
Some text
```

2.1 Getting Started

2.1.1 Installation

lookatme can be installed with pip using the command:

```
pip install lookatme
```

2.1.2 **Usage**

The lookatme CLI has a few options to control it's behavior:

```
Usage: lookatme [OPTIONS] [INPUT_FILES]...
 lookatme - An interactive, terminal-based markdown presentation tool.
 See https://lookatme.readthedocs.io/en/v{{VERSION}} for documentation
Options:
 --debug
 -1, --log PATH
 -t, --theme [dark|light]
 -s, --style_
→[default|emacs|friendly|colorful|autumn|murphy|manni|monokai|perldoc|pastie|borland|trac|native|fre
→light|paraiso-dark|lovelace|algol|algol_nu|arduino|rainbow_dash|abap|solarized-
→dark|solarized-light|sas|stata|stata-light|stata-dark|inkpot]
 --dump-styles
                                  Dump the resolved styles that will be used
                                  with the presentation to stdout
 --live, --live-reload
                                  Watch the input filename for modifications
                                  and automatically reload
 -s, --safe
                                  Do not load any new extensions specified in
                                  the source markdown. Extensions specified
                                  via env var or -e are still loaded
  --no-ext-warn
                                  Load new extensions specified in the source
                                  markdown without warning
 -i, --ignore-ext-failure
                                 Ignore load failures of extensions
 -e, --exts TEXT
                                  A comma-separated list of extension names to
                                  automatically load (LOOKATME_EXTS)
 --single, --one
                                  Render the source as a single slide
  --version
                                  Show the version and exit.
  --help
                                  Show this message and exit.
```

--live / --live-reload

This flag turns on live reloading within lookatme. If the input markdown is a filepath (and not stdin), the filepath with be watched for changes to its modification time. If a change to the file's modification time is observed, the slide deck is re-read and rendered, keeping the current slide in focus.

If your editor supports saving with every keystroke, instant slide updates are possible:

```
-e EXT_NAME1, EXT_NAME2 / --exts EXT_NAME1, EXT_NAME2
```

Allows a comma-separated list of extension names to be pre-loaded into lookatme without requring them to be declared in the Markdown source.

```
-s / --safe
```

Do **NOT** load any new extensions specified in the markdown (ignore them). New extensions are extensions that have not manually been allowed via the -e argument or the LOOKATME_EXTS environment variable.

```
--no-ext-warn
```

Do not warn about new extensions that are to-be-loaded that are specified in the source markdown. New extensions are extensions that have not manually been allowed via the -e argument or the LOOKATME_EXTS environment variable.

-i

Ignore failure loading extensions. This does not ignore warnings, but ignores any hard-errors during import, such as ImportError.

```
--single / --one
```

Render the markdown source as a single slide, ignoring all hrules. Scroll overflowing slides with the up/down arrow keys and page up/page down.

--debug and --log

Turns on debug logging for lookatme. The debug log will be created in your platform's temporary directory by default and will be named lookatme.log:

You may set a custom log location with the --log flag

--theme

Themes in lookatme are pre-defined stylings. Lookatme comes with two built-in themes: dark and light. These themes are intended to look good on dark terminals and light terminals.

See the *Dark Theme* and *Light Theme* pages for more details. See the *Style Precedence* page for details on the order style overrides and settings are applied.

--style

This option overrides the Pygments syntax highlighting style to use. See the *Style Precedence* for details about style overriding order.

At the time of this writing, available Pygments style options include:

- · default
- emacs
- · friendly
- · colorful
- · autumn
- murphy
- manni
- monokai
- perldoc
- · pastie
- borland
- trac
- native
- fruity
- bw
- vim
- vs
- tango
- rrt
- xcode
- igor
- · paraiso-light
- · paraiso-dark
- lovelace
- algol
- algol_nu
- · arduino

- · rainbow_dash
- abap
- · solarized-dark
- · solarized-light
- sas
- stata
- stata-light
- · stata-dark

--dump-styles

Print the final, resolved style definition that will be used to render the markdown as currently specified on the command-line. See the *Style Precedence* section for details on how this works.

E.g.:

```
lookatme examples/tour.md -theme --style solarized-dark --dump-styles
```

2.2 Slides

Slides in lookatme are:

- Separated by hrule elements: --- in Markdown
- · Resized to fit the current window

2.2.1 Metadata

Slide metadata is contained within an optional YAML header:

```
title: TITLE
author: AUTHOR
date: 2019-12-02
extensions: []
styles: {}
---
```

Extensions

Extensions are lookatme contrib modules that redefine lookatme behavior. E.g., the lookatmecontrib. calendar example in the examples folder redefines the render_code function found in lookatme/render/markdown_block.py.

The original render_code function gives contrib extensions first-chance at handling any function calls. Contrib extensions are able to ignore function calls, and thus allow the default lookatme behavior, by raising the <code>IgnoredByContrib</code> exception:

2.2. Slides 9

```
import datetime
import calendar
import urwid

from lookatme.exceptions import IgnoredByContrib

def render_code(token, body, stack, loop):
    lang = token["lang"] or ""
    if lang != "calendar":
        raise IgnoredByContrib()

    today = datetime.datetime.utcnow()
    return urwid.Text(calendar.month(today.year, today.month))
```

Styles

In addition to the --style and --theme CLI options for lookatme, the slide metadata may explicitly override styling behaviors within lookatme:

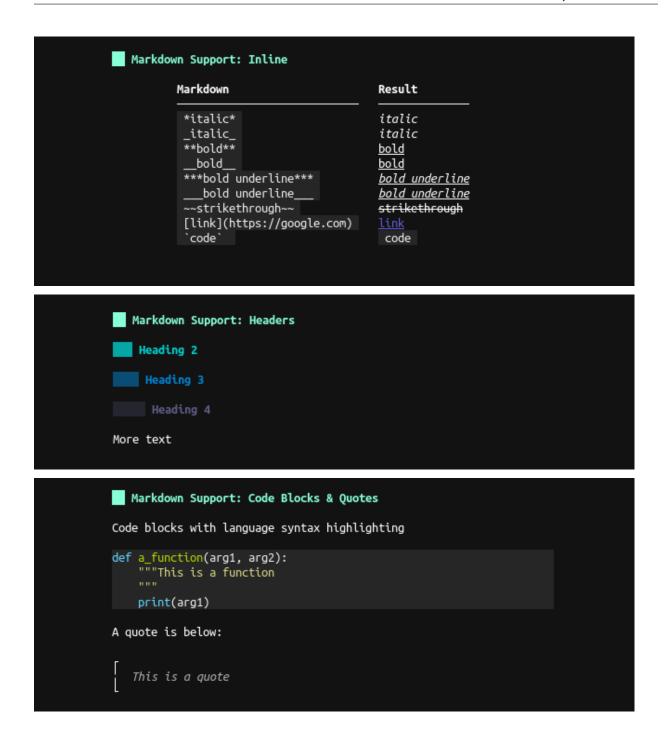

```
title: TITLE
author: AUTHOR
date: 2019-12-02
styles:
   style: monokai
   table:
      column_spacing: 3
      header_divider: "-"
---
# Slide 1
text
```

The final, resolved styling settings that will be used when displaying a markdown source is viewable by adding the --dump-styles flag as a command-line argument.

See the *Default Style Settings* for a full list of available, overrideable styles.

2.3 Dark Theme

The dark theme is intended to appear well on terminals with dark backgrounds

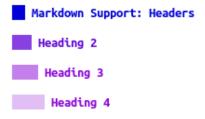

2.4 Light Theme

The light theme is intended to appear well on terminals with light backgrounds

2.4. Light Theme

Markdown Support: Inline

Markdown Result *italic* italic italic italic **bold** bold bold bold ***bold underline*** bold underline _bold underline_ bold underline ~~strikethrough~~ strikethrough [link](https://google.com) <u>link</u> `code` code

More text

Markdown Support: Code Blocks & Quotes

Code blocks with language syntax highlighting

```
def a_function(arg1, arg2):
    """This is a function
    """
    print(arg1)
```

A quote is below:

```
This is a quote
```

2.5 Style Precedence

Styling may be set in three locations in lookatme:

- 1. In a theme
- 2. In a slide's YAML header
- 3. On the command-line

When constructing the final, resolved style set that will be used to render markdown, lookatme starts with the default style settings defined in <code>lookatme.schemas</code>, and then applies overrides in the order specified above.

Overrides are applied by performing a deep merge of nested dictionaries. For example, if the default styles defined in schemas.py were:

```
headings:
    "1":
    fg: "#33c,bold"
    bg: "default"
    "2":
    fg: "#222,bold"
    bg: "default"
```

... and if the style overrides defined by a theme were:

```
headings:
   "1":
   bg: "#f00"
```

... and if the style overrides defined in the slide YAML header were:

```
headings:
   "2":
    fg: "#f00,bold,underline"
```

The final, resolved style settings for rendering the markdown would be:

```
headings:
    "1":
    fg: "#33c,bold"
    bg: "#f00" # from the theme
    "2":
    fg: "#f00,bold,underline" # from the slide YAML header
    bg: "default"
```

2.5.1 Default Style Settings

The default styles and formats are defined in the marshmallow schemas in <code>lookatme.schemas</code>. The dark theme is an empty theme with no overrides (the defaults *are* the dark theme):

```
author:
 bg: default
  fg: '#f30'
bullets:
  111: •
  121:
  131: 0
  default: •
 bg: default
  fg: '#777'
headings:
  '1':
    bg: default
    fg: '#9fc,bold'
   prefix: ' '
   suffix: ''
  121:
```

(continues on next page)

(continued from previous page)

```
bg: default
   fg: '#1cc,bold'
   prefix: ' '
   suffix: ''
  131:
    bg: default
    fg: '#29c,bold'
   prefix: ' '
    suffix: ''
  141:
   bg: default
    fg: '#559,bold'
   prefix: ' '
   suffix: ''
  default:
    bg: default
    fg: '#346,bold'
    prefix: ' '
    suffix: ''
hrule:
  char: -
  style:
   bg: default
   fg: '#777'
link:
 bg: default
  fg: '#33c, underline'
margin:
 bottom: 0
  left: 2
 right: 2
 top: 0
numbering:
  '1': numeric
  '2': alpha
  '3': roman
  default: numeric
padding:
 bottom: 0
  left: 10
  right: 10
 top: 0
quote:
 bottom_corner: L
  side:
  style:
   bg: default
   fg: italics, #aaa
  top_corner:
slides:
 bg: default
  fg: '#f30'
style: monokai
table:
  column_spacing: 3
  header_divider: -
title:
```

(continues on next page)

(continued from previous page)

```
bg: default
fg: '#f30,bold,italics'
```

2.6 Contrib Extensions

lookatme allows an extension to override and redefine how markdown is rendered. Extensions have first-chance opportunities to handle rendering function calls. Extensions also have the ability to ignore specific rendering function calls and allow original lookatme behavior (or other extensions) to handle the call to that rendering function.

For example, an extension may provide its own implementation of the render function render_table to provide custom table rendering, such as sortable rows, alternating row background colors, etc.

2.6.1 Using Extensions

Extensions are namespace packages within lookatme.contrib. The are used by

- 1. Installing the extension with pip install lookatme.contrib.XXX
- 2. Adding the extension to the list of extensions required by your slides:

```
title: TITLE
author: AUTHOR
date: 2019-11-01
extensions:
- xxx
---
# Slide 1
```

2.6.2 Extension Layout

It is highly recommended that you use the lookatme.contrib-template to create new extensions.

Extensions *must* be a namespaced module within the lookatme.contrib submodule. The basic tree layout for such an extension is below:

Notice that there is not an __init__.py file in the contrib path. This is using the implicit namespace package format for creating namespace packages, where an __init__.py is not needed.

2.6.3 Extension setup.py

Below is the setup.py from the examples/calendar_contrib extension:

```
from setuptools import setup, find_namespace_packages
import os

setup(
    name="lookatme.contrib.calendar",
    version="0.0.0",
    description="Adds a calendar code block type",
    author="James Johnson",
    author_email="d0c.s4vage@gmail.com",
    python_requires=">=3.5",
    packages=find_namespace_packages(include=["lookatme.*"]),
)
```

2.6.4 Overriding Behavior

Any function within lookatme that is decorated with @contrib_first may be overridden by an extension by defining a function of the same name within the extension module.

For example, to override the render_code function that is declared in lookatme in lookatme/render/markdown_block.py, the example calender extension must declare its own function named render_code that accepts the same arguments and provides the same return values as the original function:

```
Defines a calendar extension that overrides code block rendering if the
language type is calendar
import datetime
import calendar
import urwid
from lookatme.exceptions import IgnoredByContrib
def user_warnings():
    """No warnings exist for this extension. Anything you want to warn the
   user about, such as security risks in processing untrusted markdown, should
   go here.
    n n n
   return []
def render_code(token, body, stack, loop):
   lang = token["lang"] or ""
   if lang != "calendar":
       raise IgnoredByContrib()
```

(continues on next page)

(continued from previous page)

```
today = datetime.datetime.utcnow()
return urwid.Text(calendar.month(today.year, today.month))
```

Notice how the extension code above raises the <code>IgnoredByContrib</code> exception to allow the default lookatme behavior to occur.

2.6.5 Overrideable Functions

Below is an automatically generated list of all overrideable functions that are present in this release of lookatme. See the <code>lookatme.tui.SlideRenderer.do_render</code> function for details on markdown_block render function arguments and return values.

- render_newline
- render_hrule
- render_heading
- render_table
- render_list_start
- render_list_end
- render_list_item_start
- render_loose_item_start
- render_list_item_end
- render_text
- render paragraph
- render_block_quote_start
- render_block_quote_end
- render_code
- inline_html
- text
- escape
- autolink
- footnote_ref
- image
- link
- double_emphasis
- emphasis
- codespan
- linebreak
- strikethrough
- root_urwid_widget

2.7 Smart Slide Splitting

lookatme will automatically split input markdown into separate slides if no hrules are present in the input markdown.

Slides are split automatically in two ways

- 1. If the lowest (e.g. h1 < h2) heading occurs only once, that heading is used as the title for the presentation. The next lowest heading will be used as the slide separator marker.
- 2. If the lowest (e.g. h1 < h2) heading occurs multiple times, that heading will be used as the slide separator marker and the heading will not be set.

E.g., below is the README.md of lookatme:

2.8 Builtin Extensions

lookatme comes with a few built-in extensions.

2.8.1 Builtin Extension Qualification

Builtin extensions must:

- Not require extra dependencies just for the extension
- Be generally useful in most cases

E.g., the qrcode extension has an extra dependency. This immediately disqualifies it from being a builtin extension.

2.8.2 **Usage**

Although builtin extensions are defined in the same way as external *Contrib Extensions*, builtin extensions do not need to be explicitly declared in the YAML header.

2.8.3 List of Builtin Extensions

Terminal Extension

The lookatme.contrib.terminal builtin extension allows terminals to be embedded within slides.

Basic Format

The terminal extension modifies the code block markdown rendering by intercepting code blocks whose language has the format terminal\d+. The number following the terminal string indicates how many rows the terminal should use when rendered (the height).

Usage

E.g.

```
```terminal8
bash -il
```
```

The content of the code block is the command to be run in the terminal. Clicking inside of the terminal gives the terminal focus, which will allow you to interact with it, type in it, etc.

To escape from the terminal, press ctrl+a.

Extended Format

The terminal extension also has a *terminal-ex* mode that can be used as the language in a code block. When *terminal-ex* is used, the contents of the code block must be YAML that conforms to the *TerminalExSchema* schema.

The default schema is shown below:

```
command: "the command to run" # required
rows: 10
                               # number of rows for the terminal (height)
init_text: null
                               # initial text to feed to the command. This is
                                     useful to, e.g., pre-load text on a
                               #
                                     bash prompt so that only "enter" must be
                                   pressed. Uses the `expect` command.
init_wait: null
                               # the prompt (string) to wait for with `expect`
                                    this is required if init_text is set.
                               # show a codeblock with the init_text as its
init codeblock: true
                               # content
                               # the language of the init codeblock
init_codeblock_lang: text
```

Usage

E.g.

```
```terminal-ex
command: bash -il
rows: 20
init_text: echo hello
init_wait: '$> '
init_codeblock_lang: bash
```
```

File Loader Extension

The <code>lookatme.contrib.file_loader</code> builtin extension allows external files to be sourced into the code block, optionally being transformed and optionally restricting the range of lines to display.

Format

The file loader extension modifies the code block markdown rendering by intercepting code blocks whose language equals file. The contents of the code block must be YAML that conforms to the *FileSchema* schema.

The default schema is shown below:

```
path: path/to/the/file # required
relative: true  # relative to the slide source directory
lang: text  # pygments language to render in the code block
transform: null  # optional shell command to transform the file data
lines:
    start: 0
    end: null
```

Note: The line range is only applied **AFTER** transformations are performed on the file data.

Usage

E.g.

```
```file
path: ../source/main.c
lang: c
```
```

2.9 lookatme

2.9.1 lookatme package

Subpackages

lookatme.contrib package

Submodules

lookatme.contrib.file_loader module

Bases: marshmallow.schema.Schema

This module defines a built-in contrib module that enables external files to be included within the slide. This is extremely useful when having source code displayed in a code block, and then running/doing something with the source data in a terminal on the same slide.

```
class lookatme.contrib.file_loader.FileSchema (*, only: Union[Sequence[str], Set[str], None] = None, exclude: Union[Sequence[str], Set[str]] = (), many: bool = False, context: Optional[Dict[KT, VT]] = None, load_only: Union[Sequence[str], Set[str]] = (), dump_only: Union[Sequence[str], Set[str]] = (), partial: Union[bool, Sequence[str], Set[str]] = False, unknown: Optional[str] = None)
```

```
class Meta
        Bases: object
         render_module
            alias of YamlRender
    lang = <fields.String(default='auto', attribute=None, validate=None, required=False, 1</pre>
    lines = <fields.Nested(default={'end': None, 'start': 0}, attribute=None, validate=N</pre>
    opts = <marshmallow.schema.SchemaOpts object>
    path = <fields.String(default=<marshmallow.missing>, attribute=None, validate=None, re
    relative = <fields.Boolean(default=True, attribute=None, validate=None, required=False
    transform = <fields.String(default=None, attribute=None, validate=None, required=False
class lookatme.contrib.file_loader.LineRange(*,
                                                         only:
                                                                    Union[Sequence[str],
                                                   Set[str],
                                                            None = None, exclude:
                                                   Union[Sequence[str], Set[str]] = (),
                                                   many: bool = False, context: Op-
                                                   tional[Dict[KT, VT]] = None, load\_only:
                                                   Union[Sequence[str], Set[str]] = (),
                                                   dump_only: Union[Sequence[str], Set[str]]
                                                   = (), partial: Union[bool, Sequence[str],
                                                   Set[str]] = False, unknown: Optional[str]
                                                   = None)
    Bases: marshmallow.schema.Schema
    end = <fields.Integer(default=None, attribute=None, validate=None, required=False, loa
    opts = <marshmallow.schema.SchemaOpts object>
    start = <fields.Integer(default=0, attribute=None, validate=None, required=False, load
class lookatme.contrib.file_loader.YamlRender
    Bases: object
    dumps()
    loads()
lookatme.contrib.file_loader.render_code (token, body, stack, loop)
    Render the code, ignoring all code blocks except ones with the language set to file.
lookatme.contrib.file_loader.transform_data(transform_shell_cmd, input_data)
    Transform the input_data using the transform_shell_cmd shell command.
lookatme.contrib.file_loader.user_warnings()
    Provide warnings to the user that loading this extension may cause shell commands specified in the markdown
    to be run.
```

lookatme.contrib.terminal module

This module defines a built-in contrib module that enables terminal embedding within a slide.

2.9. lookatme

```
class lookatme.contrib.terminal.TerminalExSchema(*,
                                                            only:
                                                                    Union[Sequence[str],
                                                        Set[str], None] = None, exclude:
                                                        Union[Sequence[str], Set[str]] =
                                                        (), many: bool = False, context:
                                                        Optional[Dict[KT, VT]] = None,
                                                        load only:
                                                                   Union[Sequence[str],
                                                        Set[str]]
                                                                = (),
                                                                           dump only:
                                                        Union[Sequence[str],
                                                                              Set[str]]
                                                        = (), partial: Union[bool, Se-
                                                        quence[str], Set[str]] = False,
                                                        unknown: Optional[str] = None)
    Bases: marshmallow.schema.Schema
    The schema used for terminal-ex code blocks.
    class Meta
        Bases: object
         render module
            alias of YamlRender

class lookatme.contrib.terminal.YamlRender
    Bases: object
    dumps()
    loads()
lookatme.contrib.terminal.render_code(token, body, stack, loop)
lookatme.contrib.terminal.shutdown()
lookatme.contrib.terminal.user_warnings()
    Provide warnings to the user that loading this extension may cause shell commands specified in the markdown
    to be run.
```

Module contents

This module handles loading and using lookatme_contriba modules

Contrib modules are directly used

```
lookatme.contrib.contrib_first(fn)
```

A decorator that allows contrib modules to override default behavior of lookatme. E.g., a contrib module may override how a table is displayed to enable sorting, or enable displaying images rendered with ANSII color codes and box drawing characters, etc.

Contrib modules may ignore chances to override default behavior by raising the lookatme.contrib. IgnoredByContrib exception.

lookatme.contrib.load contribs (contrib names, safe contribs, ignore load failure=False)

Load all contrib modules specified by contrib_names. These should all be namespaced packages under the lookatmecontrib namespace. E.g. lookatmecontrib calendar would be an extension provided by a contrib module, and would be added to an extensions list in a slide's YAML header as calendar.

safe_contribs is a set of contrib names that are manually provided by the user by the -e flag or env variable of extensions to auto-load.

```
lookatme.contrib.shutdown_contribs()
```

Call the shutdown function on all contrib modules

```
lookatme.contrib.validate_extension_mod(ext_name, ext_mod)
```

Validate the extension, returns an array of warnings associated with the module

lookatme.render package

Submodules

lookatme.render.asciinema module

lookatme.render.markdown_block module

Defines render functions that render lexed markdown block tokens into urwid representations

```
lookatme.render.markdown_block.render_block_quote_end(token, body, stack, loop)
```

Pops the block quote start urwid.Pile() from the stack, taking future renderings out of the block quote styling.

See lookatme.tui.SlideRenderer.do_render for additional argument and return value descriptions

lookatme.render.markdown_block.render_block_quote_start(token, body, stack, loop)

Begins rendering of a block quote. Pushes a new urwid.Pile() to the stack that is indented, has styling applied, and has the quote markers on the left.

This function makes use of the styles:

```
quote:
  top_corner: ""
  bottom_corner: "L"
  side: ""
  style:
   bg: default
  fg: italics, #aaa
```

See lookatme.tui.SlideRenderer.do_render for additional argument and return value descriptions

```
\verb|lookatme.render.markdown_block.render_code| (\textit{token}, \textit{body}, \textit{stack}, \textit{loop})
```

Renders a code block using the Pygments library.

See $lookatme.tui.SlideRenderer.do_render$ for additional argument and return value descriptions.

lookatme.render.markdown_block.render_heading(token, body, stack, loop)

Render markdown headings, using the defined styles for the styling and prefix/suffix.

See lookatme.tui.SlideRenderer.do_render for argument and return value descriptions.

2.9. lookatme

Below are the default stylings for headings:

```
headings:
  '1':
   bg: default
    fq: '#9fc,bold'
   prefix: " "
    suffix: ""
  121:
   bg: default
    fg: '#1cc, bold'
    prefix: " "
   suffix: ""
  131:
   bg: default
    fg: '#29c,bold'
   prefix: " "
    suffix: ""
   bg: default
    fg: '#66a,bold'
    prefix: " "
    suffix: ""
  default:
    bg: default
    fg: '#579,bold'
    prefix: " "
    suffix: ""
```

Returns A list of urwid Widgets or a single urwid Widget

```
lookatme.render.markdown_block.render_hrule(token, body, stack, loop)
Render a newline
```

See lookatme.tui.SlideRenderer.do_render for argument and return value descriptions.

```
lookatme.render.markdown_block.render_list_end(token, body, stack, loop)
Pops the pushed urwid.Pile() from the stack (decreases indentation)
```

See lookatme.tui.SlideRenderer.do_render for argument and return value descriptions.

```
lookatme.render.markdown_block.render_list_item_end(token, body, stack, loop)
Pops the pushed urwid.Pile() from the stack (decreases indentation)
```

See lookatme.tui.SlideRenderer.do_render for argument and return value descriptions.

lookatme.render.markdown_block.render_list_item_start (token, body, stack, loop)
Render the start of a list item. This function makes use of the styles:

```
bullets:
   '1': "•"
   '2': ""
   '3': "o"
   default: "•"
```

See lookatme.tui.SlideRenderer.do_render for argument and return value descriptions.

```
lookatme.render.markdown_block.render_list_start (token, body, stack, loop)

Handles the indentation when starting rendering a new list. List items themselves (with the bullets) are rendered by the <code>render_list_item_start</code> function.
```

See lookatme.tui.SlideRenderer.do_render for argument and return value descriptions.

lookatme.render.markdown_block.render_loose_item_start (token, body, stack, loop)
Render the start of a list item. This function makes use of the styles:

```
bullets:
   '1': "•"
   '2': ""
   '3': "o"
   default: "•"
```

See lookatme.tui.SlideRenderer.do_render for argument and return value descriptions.

lookatme.render.markdown_block.render_newline(token, body, stack, loop)

Render a newline

See <code>lookatme.tui.SlideRenderer.do_render</code> for argument and return value descriptions.

lookatme.render.markdown_block.render_paragraph (token, body, stack, loop)
Renders the provided text with additional pre and post paddings.

See lookatme.tui.SlideRenderer.do_render for additional argument and return value descriptions.

lookatme.render.markdown_block.render_table (token, body, stack, loop)
Renders a table using the Table widget.

See lookatme.tui.SlideRenderer.do_render for argument and return value descriptions.

The table widget makes use of the styles below:

```
table:
  column_spacing: 3
  header_divider: "-"
```

Returns A list of urwid Widgets or a single urwid Widget

Renders raw text. This function uses the inline markdown lexer from mistune with the <code>lookatme.render.markdown_inline</code> render module to render the lexed inline markup to a list composed of widgets or urwid Text markup. The created list of widgets/Text markup is then used to create and return a list composed entirely of widgets and <code>ClickableText</code> instances.

Many other functions call this function directly, passing in the extra text argument and leaving all other arguments blank.

See lookatme.tui.SlideRenderer.do_render for additional argument and return value descriptions.

lookatme.render.markdown inline module

Defines render functions that work with mistune's markdown inline lexer render interface

```
lookatme.render.markdown_inline.autolink(link_uri, is_email=False)
    Renders a URI as a link
```

Returns list of urwid Text markup tuples.

2.9. lookatme 25

```
lookatme.render.markdown_inline.codespan(text, old_styles)
```

Renders inline code using the pygments renderer. This function also makes use of the coding style:

```
style: monokai
```

Returns

list of urwid Text markup tuples.

```
lookatme.render.markdown_inline.double_emphasis(text, old_styles)
```

Renders double emphasis. Handles both **word** and __word__

Returns

list of urwid Text markup tuples.

```
lookatme.render.markdown_inline.emphasis(text, old_styles)
```

Renders double emphasis. Handles both *word* and _word_

Returns

list of urwid Text markup tuples.

```
lookatme.render.markdown_inline.escape(text)
```

Renders escapes

Returns

list of urwid Text markup tuples.

```
lookatme.render.markdown_inline.expanded_styles(fn)
```

lookatme.render.markdown_inline.footnote_ref(key, index)

Renders a footnote

Returns

list of urwid Text markup tuples.

```
lookatme.render.markdown inline.image(link uri, title, text)
```

Renders an image as a link. This would be a cool extension to render referenced images as scaled-down ansii pixel blocks.

Returns

list of urwid Text markup tuples.

```
lookatme.render.markdown_inline.inline_html (text)
```

Renders inline html as plaintext

Returns

list of urwid Text markup tuples.

```
lookatme.render.markdown_inline.linebreak()
```

Renders a line break

Returns

list of urwid Text markup tuples.

```
lookatme.render.markdown_inline.link(link_uri, title, link_text)
```

Renders a link. This function does a few special things to make the clickable links happen. All text in lookatme is rendered using the <code>ClickableText</code> class. The <code>ClickableText</code> class looks for <code>urwid.AttrSpec</code> instances that are actually <code>LinkIndicatorSpec</code> instances within the Text markup. If an AttrSpec is an

instance of LinkIndicator spec in the Text markup, ClickableText knows to handle clicks on that section of the text as a link.

Returns

```
list of urwid Text markup tuples.
```

```
lookatme.render.markdown inline.placeholder()
```

The starting point of the rendering. The final result will be this returned list with all inline markdown tokens translated into urwid objects

```
lookatme.render.markdown_inline.render_no_change(text)
```

Render inline markdown text with no changes

```
lookatme.render.markdown_inline.strikethrough(text, old_styles)
```

Renders strikethrough text (~~text~~)

Returns

list of urwid Text markup tuples.

```
lookatme.render.markdown_inline.text(text)
```

Renders plain text (does nothing)

Returns

list of urwid Text markup tuples.

lookatme.render.pygments module

Pygments related rendering

```
\textbf{class} \ \texttt{lookatme.render.pygments.UrwidFormatter} \ (**options)
```

 $Bases: {\tt pygments.formatter.Formatter}$

Formatter that returns [(text,attrspec), ...], where text is a piece of text, and attrspec is an urwid.AttrSpec

```
classmethod findclosest (colstr, colors=256)
```

Takes a hex string and finds the nearest color to it.

Returns a string urwid will recognize.

```
findclosestattr (fgcolstr=None, bgcolstr=None, othersettings=", colors=256)
```

Takes two hex colstring (e.g. 'ff00dd') and returns the nearest urwid style.

```
format (tokensource, outfile)
```

Format tokensource, an iterable of (tokentype, tokenstring) tuples and write it into outfile.

formatgenerator (tokensource)

Takes a token source, and generates (tokenstring, urwid.AttrSpec) pairs

style

```
lookatme.render.pygments.get_formatter(style_name)
lookatme.render.pygments.get_lexer(lang, default='text')
lookatme.render.pygments.get_style(style_name)
lookatme.render.pygments.render_text(text, lang='text', style_name=None, plain=False)
    Render the provided text with the pygments renderer
```

2.9. lookatme 27

Module contents

lookatme.themes package

Submodules

lookatme.themes.dark module

Defines styles that should look good on dark backgrounds

lookatme.themes.light module

Module contents

Defines the built-in styles for lookatme

```
lookatme.themes.ensure_defaults(mod)
```

Ensure that all required attributes exist within the provided module

lookatme.widgets package

Submodules

lookatme.widgets.clickable_text module

```
This module contains code for ClickableText
```

lookatme.widgets.table module

```
Defines a basic Table widget for urwid
```

```
class lookatme.widgets.table.Table(rows, headers=None, aligns=None)
    Bases: urwid.container.Pile
    Create a table from a list of headers, alignment values, and rows.
    calc_column_maxes()
```

```
create_cells (body_rows, modifier=None)
```

Create the rows for the body, optionally calling a modifier function on each created cell Text. The modifier must accept an urwid.Text object and must return an urwid.Text object.

```
render (size, focus=False)
```

Do whatever needs to be done to render the table

```
set column maxes()
```

Calculate and set the column maxes for this table

```
signals = ['change']
```

 $\mathbf{watch}(w)$

Watch the provided widget w for changes

Module contents

Submodules

lookatme.ascii_art module

Misc ASCII art

lookatme.config module

Config module for lookatme

lookatme.exceptions module

Exceptions used within lookatme

```
exception lookatme.exceptions.IgnoredByContrib
```

Bases: Exception

Raised when a contrib module's function chooses to ignore the function call.

lookatme.log module

Logging module

lookatme.parser module

This module defines the parser for the markdown presentation file

```
class lookatme.parser.Parser(single_slide=False)
    Bases: object
```

A parser for markdown presentation files

2.9. lookatme

```
parse (input_data)
```

Parse the provided input data into a Presentation object

Parameters input_data (str) - The input markdown presentation to parse

Returns Presentation

```
parse_meta(input_data)
```

Parse the PresentationMeta out of the input data

Parameters input_data (str) - The input data string

Returns tuple of (remaining_data, meta)

parse_slides (meta, input_data)

Parse the Slide out of the input data

Parameters

- **meta** (dict) The parsed meta values
- input_data (str) The input data string

Returns tuple of (remaining_data, slide)

lookatme.pres module

Defines Presentation specific objects

```
class lookatme.pres.Presentation(input_stream, theme, style_override=None, live_reload=False, single_slide=False, preload_extensions=None, safe=False, no_ext_warn=False, ignore_ext_failure=False)
```

Bases: object

Defines a presentation

reload(data=None)

Reload this presentation

Parameters data (str) – The data to render for this slide deck (optional)

reload_watcher()

Watch for changes to the input filename, automatically reloading when the modified time has changed.

run (start_slide=0)

Run the presentation!

warn_exts (exts)

Warn about source-provided extensions that are to-be-loaded

lookatme.prompt module

Basic user-prompting helper functions

```
lookatme.prompt.yes (msg)
```

Prompt the user for a yes/no answer. Returns bool

lookatme.schemas module

```
Defines all schemas used in lookatme
class lookatme.schemas.BlockQuoteSchema(*, only: Union[Sequence[str], Set[str], None] =
                                                None, exclude: Union[Sequence[str], Set[str]] =
                                                (), many: bool = False, context: Optional[Dict[KT,

class lookatme.schemas.YamlRender
    Bases: object
    dumps()
```

```
loads()
```

lookatme.slide module

```
Slide info holder
```

```
class lookatme.slide.Slide(tokens, md=None, number=0)
    Bases: object
```

This class defines a single slide. It operates on mistune's lexed tokens from the input markdown

lookatme.tui module

This module defines the text user interface (TUI) for lookatme

```
class lookatme.tui.MarkdownTui(pres, start_idx=0)
     Bases: urwid.container.Frame
     keypress (size, key)
          Handle keypress events
     prep_pres (pres, start_idx=0)
          Prepare the presentation for displaying/use
          Reload the input, keeping the current slide in focus
     run()
     update()
     update_body()
          Render the provided slide body
     update_creation()
          Update the author and date
     update_slide_num()
          Update the slide number
     update slide settings()
          Update the slide margins and paddings
     update_title()
          Update the title
class lookatme.tui.SlideRenderer(loop)
     Bases: threading. Thread
     daemon = True
     do_render (to_render, slide_num)
          Perform the actual rendering of a slide. This is done by:
            • parsing the slide into tokens (should have occurred already)
            • iterating through each parsed markdown token
```

Each render function must have the signature:

render.markdown block

2.9. lookatme 35

• calling the appropriately-named render function for the token["type"] in lookatme.

```
def render_XXX(token, body, stack, loop):
    pass
```

The arguments to the render function are described below:

- token the lexed markdown token a dictionary
- body the current urwid. Pile () that return values will be added to (same as stack [-1])
- stack The stack of urwid.Pile() used during rendering. E.g., when rendering nested lists, each nested list will push a new urwid.Pile() to the stack, each wrapped with its own additional indentation.
- loop the urwid.MainLoop instance being used by lookatme. This won't usually be used, but is
 available if needed.

Main render functions (those defined in markdown block.py) may have three types of return values:

- None nothing is added to stack [-1]. Perhaps the render function only needed to add additional indentation by pushing a new urwid.Pile() to the stack.
- list (urwid.Widget) A list of widgets to render. These will automatically be added to the Pile at stack [-1]
- urwid. Widget A single widget to render. Will be added to stack [-1] automatically.

flush_cache()

Clea everything out of the queue and the cache.

```
get slide(slide number)
```

Fetch the slide from the cache

```
queue_render (slide)
```

Queue up a slide to be rendered.

```
render slide(slide, force=False)
```

Render a slide, blocking until the slide completes. If force is True, rerender the slide even if it is in the cache.

run()

Run the main render thread

stop()

lookatme.tui.create_tui(pres, start_slide=0)

Run the provided presentation

Parameters start_slide (int) - 0-based slide index

```
lookatme.tui.root urwid widget(to wrap)
```

This function is overridable by contrib extensions that need to specify the root urwid widget.

The return value *must* return either the to_wrap widget itself, or another widget that wraps the provided to wrap widget.

```
lookatme.tui.text(style, data, align='left')
```

lookatme.utils module

```
lookatme.utils.can_style_item(item)
```

Return true/false if style_text can work with the given item

```
lookatme.utils.flatten_text(text, new_spec=None)
     Return a flattend list of tuples that can be used as the first argument to a new urwid.Text().
          Parameters
                • text (urwid. Text) - The text to flatten
                • new_spec (urwid.AttrSpec) - A new spec to merge with existing styles
          Returns list of tuples
lookatme.utils.get_fg_bg_styles(style)
lookatme.utils.int_to_roman(integer)
lookatme.utils.listbox_add(listbox, widgets)
lookatme.utils.overwrite_spec (orig_spec, new_spec)
lookatme.utils.pile_add(pile, widgets)
lookatme.utils.pile_or_listbox_add(container, widgets)
     Add the widget/widgets to the container
lookatme.utils.resolve_bag_of_text_markup_or_widgets(items)
     Resolve the list of items into either contiguous urwid. Text() instances, or pre-existing urwid. Widget objects
lookatme.utils.row_text(rendered_row)
     Return all text joined together from the rendered row
lookatme.utils.spec_from_style(styles)
     Create an urwid.AttrSpec from a {fg:"", bg:""} style dict. If styles is a string, it will be used as the foreground
lookatme.utils.styled_text (text, new_styles, old_styles=None, supplement_style=False)
     Return a styled text tuple that can be used within urwid. Text.
```

Note: If an urwid. Text instance is passed in as the text parameter, alignment values will be lost and must be explicitly re-added by the caller.

lookatme.utils.translate_color(raw_text)

lookatme.utils.dict_deep_update (to_update, new_vals)

Deeply update the to_update dict with the new_vals
