# **About this document**

Information is presented about using z/OS UNIX System Services (z/OS UNIX). The z/OS shell and utilities provide commands based on open systems standards and services mentioned in <u>"Acknowledgments" on page 1172</u>. With the debugger, you can find and fix errors in C and C++ programs that use z/OS UNIX facilities.

You can identify and isolate problems, as well as correct errors that are made in entering commands or using them correctly. Messages are listed in alphanumeric order by message prefix. Only those messages with explanations are included.

Both reason and return codes are listed by value. In addition, the /usr/sbin/init exit status codes are included.

Some commands in z/OS UNIX System Services Command Reference have messages that are not listed in this publication. For example, messages generated from the 1d command can be found in z/OS MVS System Messages, Vol 8 (IEF-IGD).

# Who should use this document

This document is intended for any user who is trying to resolve problems that may arise in z/OS UNIX in the shells and utilities or debugger. The list of users include the application and system programmer as well as the shell user.

# How this document is organized

This document includes a subset of shell and debugger error messages from various utilities, including /bin/login, /usr/sbin/init, OMVS and other TSO/E commands, and the debugger.

The messages in this document include *italicized* text. Italicized text indicates a variable placeholder for a string, such as a *filename* or *pathname*, or a hexadecimal or decimal number.

Some of the messages in this document are accompanied by error codes or additional messages that explain the problem further. Error codes can be generated by components of z/OS, by the XL C/C+ + runtime library, or by Language Environment®. You should be able to find more information about them by referring to z/OS UNIX System Services Programming: Assembler Callable Services Reference or z/OS Language Environment Debugging Guide. Additional error messages might come from components of z/OS, from RACF®, or from TSO/E. Refer to the messages documentation for these products for explanations.

Error and reason codes are also included.

# z/OS information

This information explains how z/OS references information in other documents and on the web.

When possible, this information uses cross-document links that go directly to the topic in reference using shortened versions of the document title. For complete titles and order numbers of the documents for all products that are part of z/OS, see z/OS Information Roadmap.

To find the complete z/OS library, go to IBM Documentation (www.ibm.com/docs/en/zos).

**Learning resources:** Getting started with IBM zSystems (developer.ibm.com/learningpaths/get-started-ibmz/) provides online learning about IBM Z<sup>®</sup> basics and Red Hat<sup>®</sup> Open Shift on IBM Z.

### **Discussion list**

Customers and IBM participants also discuss z/OS UNIX on the mvs-oe discussion list. This list is not operated or sponsored by IBM.

To subscribe to the mvs-oe discussion, send a note to:

listserv@vm.marist.edu

Include the following line in the body of the note, substituting your given name and family name as indicated:

subscribe mvs-oe given\_name family\_name

After you have been subscribed, you will receive further instructions on how to use the mailing list.

# **How to provide feedback to IBM**

We welcome any feedback that you have, including comments on the clarity, accuracy, or completeness of the information. For more information, see How to send feedback to IBM.

# **Summary of changes**

This information includes terminology, maintenance, and editorial changes. Technical changes or additions to the text and illustrations for the current edition are indicated by a vertical line to the left of the change.

**Note:** IBM z/OS policy for the integration of service information into the z/OS product documentation library is documented on the z/OS Internet Library under IBM z/OS Product Documentation Update Policy (www.ibm.com/docs/en/zos/latest?topic=zos-product-documentation-update-policy).

# Summary of changes for z/OS 3.1

The following messages are new, changed, or no longer issued for z/OS UNIX in z/OS 3.1.

# **Chapter 1. Messages**

Messages are generated by the system in response to either an action or lack of action that has been detected. This section provides descriptions of the various z/OS UNIX messages a user might receive.

# Message prefixes and issuing modules

The following table is provided to help you determine what modules are issuing the messages you receive. The left-hand column lists all of the message prefixes issued by z/OS UNIX System Services. The right-hand column provides the module that issues the message.

Table 1. Message prefixes and issuing modules

Message prefix	Issuing module
BPX	BPX messages are issued from either the REXX processor or the z/OS UNIX kernel. See BPX messages in z/OS MVS System Messages, Vol 3 (ASB-BPX).
BPXT	<b>bpxtrace</b> shell command. See <u>"BPXT" on page 1</u> .
BPXW	TSO/E OEDIT and OSTEPLIB commands. See <u>"BPXW" on page 3</u> .
CDA	Common Debug Architecture (CDA) utilities. See <u>"CDA" on page 11</u> .
FDBX	z/OS Debugger. See <u>"FDBX" on page 864</u> .
FOMC	<b>chcp</b> shell commands. See <u>"FOMC" on page 16</u> .
FOMF	automount, tso, configstk, extattr, filecache, *mount utilities. See "FOMF" on page 27.
FOMI	ipcs and ipcrm shell commands. See "FOMI" on page 48.
FOMN	inetd daemon. See "FOMN" on page 48.
FOMOG	<b>pedb</b> debugger. See <u>"FOMOG" on page 815</u> .
FOMOH	pdbx debugger. See <u>"FOMOH" on page 838</u> .
FOMR	rlogin daemon. See <u>"FOMR" on page 73</u> .
FSUC	tcsh shell. See "FSUC" on page 92.
FSUM	Shell and utilities and TSO/E OMVS. See <u>"FSUM" on page 133</u> .
FSUZ	zsh shell messages. See <u>"FSUZ0001"</u> on page 765

# **Shell and Utilities messages**

# **BPXT**

BPXTR001

Error changing to UID 0 err=errno rsn=reαsoncode

# **Explanation**

An error occurred attempting to change the effective UID to UID 0. The caller must have permission to change to UID 0 to trace processes associated with user identities other than their own user identity. The error is described by the z/OS UNIX error number and reason code.

# **User response**

Ensure you have authority to change your UID. Obtain proper authority and rerun the bpxtrace command or rerun the command without specifying a different userid.

BPXTR002

Services log written to filename

# **Explanation**

The log from the z/OS UNIX IPCS interface was saved to a file to help diagnose a failure in the execution of the service. An additional message is also written indicating the service failed.

# **User response**

View the log and look for the description of the failure. Based on the type of failure take appropriate corrective actions and retry the bpxtrace command.

BPXTR003

**Error allocating data sets** 

# **Explanation**

An error occurred allocating new data sets necessary for processing the trace records. Allocation error messages should also be issued.

# **User response**

Correct the allocation error and rerun the bpxtrace command. Allocation errors may also occur running the command simultaneously from multiple sessions. Avoid running the command more than once at a time.

BPXTR004

Cannot access pid pid number

# **Explanation**

A process id specified on the bpxtrace command either does not exist or the user does not have authority to access information on that process.

# **User response**

Verify the correct pid has been specified and you have authority to view information for that pid.

BPXTR005

IPCS command error: BPXGMPTR codes: error codes

# **Explanation**

The bpxtrace command received an error from the z/OS UNIX BPXGMPTR service. The error codes from this service are shown and the log from the service is saved. Message BPXTR002 gives the location of the log file.

# **User response**

View the log and look for the description of the failure. Based on the type of failure take appropriate corrective actions and retry the bpxtrace command.

**BPXTR006** 

Write error filename errno reasoncode

### **Explanation**

The bpxtrace command received an error while writing to *filename*. The z/OS UNIX errno and reason codes are shown.

# **User response**

Correct the error and rerun the command.

#### BPXTR007

spawn error errno reasoncode

# **Explanation**

The bpxtrace command received an error attempting to spawn its trace routine. The z/OS UNIX errno and reason codes are shown.

# **User response**

Correct the error and rerun the command.

**BPXTR008** 

No Processes Found to Trace

# **Explanation**

The bpxtrace command did not find any processes that matched the specified search criteria.

### **User response**

Contact the system programmer and request that the CTRACE options be turned off.

BPXTR009

**OMVS** is not running with minimum CTRACE options

# **Explanation**

BPXTRACE determined that the OMVS CTRACE options are set above the minimum level. Because this is likely to result in trace buffers wrapping, you might get incomplete or no results from the bpxtrace command.

# **User response**

Contact the system programmer and request that OMVS CTRACE options be turned off.

### **BPXW**

BPXWE001

A record containing too many characters was found

### **Explanation**

The maximum allowed length of a line is 3275.

### User response

The file might not be usable. Correct the error if possible and reissue the command.

BPXWE002

The file is being edited or browsed under the TSO user ID

# **Explanation**

The shell session's effective UID is different than the TSO session user ID. An attempt to change the effective UID to edit the file has failed. The open will be done using the TSO user ID.

# **User response**

Correct the error and reissue the command.

**BPXWE004** 

File is in use by another edit session

### **BPXW** messages

# **Explanation**

The specified file is already being used.

# **User response**

Close the other edit session and reissue the command.

BPXWE005

Pathname too long

# **Explanation**

The absolute path name must be less than 1023 bytes long.

# User response

Correct the error and reissue the command.

**BPXWE006** 

File opened for read only

# **Explanation**

An error occurred while trying to open the file in read-write mode. The file was opened in read-only mode instead.

# **User response**

Correct the error if necessary and reissue the command.

BPXWE009

File must be a regular file

# **Explanation**

The path name that was specified is not for a regular file.

# **User response**

Correct the error and rerun the command.

BPXWE100

**OMVS** not started

# **Explanation**

z/OS UNIX must be running on this system.

### User response

Start z/OS UNIX and rerun the command.

BPXWE101

No STEPLIBLIST file

# **Explanation**

A path name to a file that contains the list of sanctioned step libraries must be specified on the command.

# **User response**

Correct the error and retry.

BPXWE102

STEPLIBLIST file not changed

# **Explanation**

No changes were made to the sanctioned step library list file.

# **User response**

No action required.

BPXWE103

Invalid data set name

# **Explanation**

The data set name specified is not valid.

# **User response**

Correct the error and retry.

BPXWE104

Lower case characters not allowed in data set names

# **Explanation**

The data set name contains a lowercase character, which is not allowed.

# **User response**

Correct the error and retry.

BPXWE105

Blanks not allowed in data set names

# **Explanation**

The data set name contains a blank character, which is not allowed.

# **User response**

Correct the error and retry.

BPXWE106

Line length exceeds 255 characters

# **Explanation**

The line contains more than 255 characters, which is not allowed.

# **User response**

Correct the error and retry.

BPXWE107

PDS members cannot be specified

# **Explanation**

The data set name contains a PDS member, which is not allowed.

# **User response**

Correct the error and retry.

BPXWE108 Line: text

# **Explanation**

Indicates the line number where the error was found.

# **User response**

Refer to the BPXWE message following BPXWE108 that contains the error description and correct the error.

BPXWE109

Warning: text

# **Explanation**

An error was issued on a sysdsn() call with the data set name specified on message BPXWE110. *Text* specifies the error issued by sysdsn(). This will not cause the command to fail.

# User response

Correct the error and retry.

**BPXWE110** 

text

### **Explanation**

*Text* indicates the text of the line in the step library list file that was found to contain an error. Refer to the BPXWE message preceding this one.

# User response

Correct the error if desired and retry.

BPXWE112

Line accepted

### **Explanation**

Only issued when BPXWE109 is issued. Indicates that the line does not cause the command to fail.

### **User response**

Refer to the preceding BPXWE109 message for the warning given.

bpxwmigf -source sourcefs [-target targetfs]
[-mode rw|ro|asis] [-parm fsparms | -noparm]

[-swap | -noswap] [-srename newname | -nosrename] [-trename

[newname] | -notrename] [-priority newpriority]

[-wait [minutes]] [-status minutes]

bpxwmigf -query [sourcefs] [-filter active|success|failed]

bpxwmigf -cancel sourcefs

# **Explanation**

The command was entered with a syntax error. Usage information is shown.

### **System action:**

No migration was started or changed.

### User response

No migration was started or changed.

### BPXWMG01I

Cannot initialize as a z/OS UNIX process.

#### **Explanation:**

User does not have access to z/OS UNIX services.

### **System action:**

Command terminates.

### **User response**

Log on with a user ID that has z/OS UNIX access and reissue the command.

#### BPXWMG002I

Log on to the console with a user ID that can access z/OS UNIX.

#### **Explanation:**

User does not have access to z/OS UNIX services.

### **System action:**

Command terminates.

### **User response:**

Log on to the console with a user ID that has z/OS UNIX access and reissue the command.

### BPXWMG003I

Priority must be 1-9.

# **Explanation**

The priority option was specified with an incorrect value.

#### **System action:**

Command terminates.

#### **User response:**

Reenter the command with the correct priority value.

#### BPXWMG004I

Extraneous or invalid option: <option>

### **Explanation:**

<option> is not the correct option.

#### **System action:**

Command terminates.

#### **User response:**

Reenter the **bpxwmigf** command using the correct syntax.

# BPXWMG005I

Extraneous or invalid option: <extra args>

## **Explanation:**

<extra args> was not recognized as valid arguments.

#### **System action:**

Command terminates.

#### **User response:**

Reenter the **bpxwmigf** command using the correct syntax.

# BPXWMG006I

Missing parm value

#### **Explanation:**

An option flag was specified without a required parameter.

#### **System action:**

Command terminates.

### **User response:**

Reenter the **bpxwmigf** command using the correct syntax.

#### BPXWMG007I

Unsupported mode value

### **Explanation:**

### **BPXW** messages

The mount mode was incorrectly specified.

### **System action:**

Command terminates.

#### **User response:**

Reenter the **bpxwmigf** command using the correct syntax.

#### BPXWMG008I

#### Wait time must be numeric

#### **Explanation:**

The wait time was incorrectly specified.

#### **System action:**

Command terminates.

#### **User response:**

Reenter the **bpxwmigf** command using the correct syntax.

### BPXWMG009I

### Mutual exclusion error with <option>

#### **Explanation:**

<option> is mutually exclusive with another option specified.

#### **System action:**

Command terminates.

#### **User response:**

Reenter the **bpxwmigf** command using the correct syntax.

### **BPXWMG010I**

### Source file system name required

#### **Explanation:**

The -source option was not specified.

#### **System action:**

Command terminates.

#### **User response:**

Reenter the **bpxwmigf** command using the correct syntax.

#### **BPXWMG011I**

#### Target file system name not allowed

#### **Explanation:**

The -target option is only permitted when starting a migration.

### **System action:**

Command terminates.

#### **User response:**

Reenter the **bpxwmigf** command using the correct syntax.

### BPXWMG012I

### Sourcefs is not mounted

#### **Explanation:**

Migration requires the source file system to be mounted.

### **System action:**

Command terminates.

#### **User response:**

Mount the source file system and reissue the command.

### **BPXWMG013I**

### Sourcefs is not an HFS or zFS

### **Explanation:**

The source file system must be an HFS or zFS.

### **System action:**

Command terminates.

### **User response:**

Retry the migration command with an HFS or zFS file system.

#### BPXWMG014I

### Target file system name too long

#### **Explanation:**

The zFS file system name must not exceed 38 characters.

### **System action:**

Command terminates.

#### **User response:**

Reenter the **bpxwmigf** command using a different zFS file system name.

#### BPXWMG015I

New source name must not be the same as the old source name

#### **Explanation:**

- srename cannot specify the same name as the source.

### **System action:**

Command terminates.

#### **User response:**

Specify the new name for the source that is different from its current name.

#### BPXWMG016I

New source name must not be the same as the old source name

#### **Explanation:**

-srename cannot specify the same name as the source.

### **System action:**

Command terminates.

#### **User response:**

Specify the new name for the source that is different from its current name.

### BPXWMG017I

### No migrations found

#### **Explanation:**

This is the query response when there are no migrations meeting the requested criteria.

#### **System action:**

None.

#### **User response:**

None.

#### **BPXWMG018I**

Unknown filter value: <filter>.

# **Explanation:**

The valid filter value can be either active, success, or failed.

#### **System action:**

Command terminates.

### **User response:**

Reenter the **bpxwmigf** command using a different zFS file system name.

#### BPXWMG019I

End of output.

#### **Explanation:**

This message line indicates the end of output for a **bpxwmigf** command.

### **System action:**

None.

### **User response:**

None.

#### **BPXWMG020I**

source file system name too long.

### **BPXW** messages

# **Explanation:**

The Source file system name was incorrectly specified.

### **System action:**

Command terminates.

#### **User response:**

Reenter the bpxwmigf command with the correct name.

#### **BPXWMG022I**

<fsname> data name, <dataname>, is not standard.

#### **Explanation:**

The name of the specified VSAM file system must have a data portion name that ends in ".DATA".

### **System action:**

The command ends.

#### **User response:**

Ensure that the VSAM file system has a data portion name that ends in .DATA and then reissue the **bpxwmigf** command with the updated name.

#### BPXWMG023I

newname is required on -srename option.

### **Explanation:**

The -srename option was specified without the newname parameter, which is required.

#### **System action:**

The command ends.

### **User response:**

Reissue the **bpxwmigf** command and include the newname parameter with the -srename option.

#### BPXWMG024I

new source file system name too long.

### **Explanation:**

Either the source HFS name is greater than 44 characters or the zFS name is greater than 38 characters.

### **System action:**

The command ends.

#### **User response:**

Ensure that the name meets the character requirements and then reissue the **bpxwmigf** command.

### BPXWMG025I

-srename newname already exists.

### **Explanation:**

The name that was specified for the rename option already exists.

### **System action:**

The command ends.

#### **User response:**

Reissue the **bpxwmigf** command with a different name for the rename option.

### BPXWMG026I

target rename file system name too long.

### **Explanation:**

The target zFS name that was specified is longer than 38 characters.

### System action:

The command ends.

#### **User response:**

Ensure that the target zFS name is not longer than 38 characters and reissue the **bpxwmigf** command.

#### BPXWMG027I

-trename newname already exists.

# **Explanation:**

The name that was used for the rename option already exists.

### **System action:**

The command ends.

#### **User response:**

Reissue the **bpxwmigf** command and use a different name for the rename option.

#### **BPXWMG028I**

<fsname> contains an invalid character.

### **Explanation:**

File system names cannot contain the \* or % characters.

### **System action:**

The command ends.

#### **User response:**

Ensure that the file system names do not have the \* or % characters and then reissue the **bpxwmigf** command.

#### BPXWMG029I

# targetfs required with -target option.

### **Explanation:**

The -target option was specified without the required targetfs parameter.

### **System action:**

The command ends.

#### **User response:**

Reissue the **bpxwmigf** command and include the targetfs parameter with the -target option.

#### BPXWMG098I

#### <internal error>

#### **Explanation:**

<internal error> describes an internal problem with the bpxwmigf command.

#### **System action:**

Command terminates.

### **User response:**

Contact IBM service.

# BPXWMG099I

#### pfsctl error <retval errno errnojr>

#### **Explanation:**

An error occurred making a pfsctl system call.

#### **System action:**

Command terminates.

### **User response:**

Subsequent messages further describe the error.

### **CDA**

# CDA0002

# An invalid option string is specified.

# **Explanation**

The indicated option is not a valid dbgld option.

In the message text:

string is an invalid option.

# **User response**

Re-enter the dbgld command and specify a valid option.

### **CDA0003**

BINDER API failed. retcode:number, rsncode:0xnumber

# **Explanation**

dbg1d is unable to retrieve information from the input module. The BINDER API has failed.

In the message text:

number is the return code from BINDER API. number is the reason code from BINDER API.

## **User response**

This is an internal error. Provide the indicated error text to the IBM service representative responsible for your installation.

#### **CDA0004**

The file string cannot be opened.

# **Explanation**

Either the input file does not exist, or the permissions for the input file or the directory containing the input file do not have read or search permission set.

In the message text:

string is the input file name.

# **User response**

Ensure the input file exists and that the input file and the directories containing the input file have read and search permissions set.

#### **CDA0005**

No debug information was found in string.

# **Explanation**

dbgld is unable to locate any debug information within the input file. No output file will be generated.

In the message text:

string is the input file name.

### **User response**

Compile at least one compilation unit with the debug compiler option.

#### **CDA0006**

Out of memory allocating number bytes for string.

# **Explanation**

The dbgld command ran out of memory processing the input file. This may happen with a large input file.

In the message text:

*number* is the number of bytes dbgld tries to allocate. *string* contains the name of the function trying to allocate the memory.

# User response

Shut down any large processes that are running. You may need to specify the runtime option HEAP(,,,FREE,,) to prevent the dbgld command from running out of memory.

**CDA0007** 

INTERNAL UTILITY ERROR: Procedure string:number.

# **Explanation**

An internal utility error occurred.

12 z/OS: z/OS UNIX System Services Messages and Codes

In the message text:

string is the procedure where the error has occured. number is the line number where the error has occured.

# **User response**

This is an internal error. Provide the indicated error text to the IBM service representative responsible for your installation.

CDA0008

The DLL string is not found.

# **Explanation**

The indicated Common Debug Architecture run-time library cannot be found.

In the message text:

string is the name of the Common Debug Architecture run-time library.

# **User response**

The indicated Common Debug Architecture run-time library should be installed in the SCEERUN2 data set. Verify that the run-time library is installed properly.

CDA0009

An incompatible DLL has been detected.
The utility requires
LIBDDPI\_DLL\_VERSION to be at least 0xnumber.
The version found in the system

is Oxnumber.

# **Explanation**

The Common Debug Architecture runtime version is outdated.

In the message text:

*number* is the Common Debug Architecture run time that dbgld is compiled with. *number* is the Common Debug Architecture run time that is currently being used.

### **User response**

Contact the IBM service representative responsible for your installation and verify that you have the latest Common Debug Architecture run time installed.

CDA0010

An incompatible DLL has been detected.
The utility requires
LIBELF\_DLL\_VERSION to be at least Oxnumber.
The version found in the system is Oxnumber.

# **Explanation**

The Common Debug Architecture runtime version is outdated.

In the message text:

*number* is the Common Debug Architecture run time that dbgld is compiled with. *number* is the Common Debug Architecture run time that is currently being used.

# **User response**

Contact the IBM service representative responsible for your installation and verify that you have the latest Common Debug Architecture run time installed.

# CDA0011

### Cannot find the function string in DLL string.

# **Explanation**

The indicated function cannot be found in the Common Debug Architecture run-time library.

In the message text:

string is the name of the function in the Common Debug Architecture run-time library. string is the name of the Common Debug Architecture run-time library.

# **User response**

Contact the IBM service representative responsible for your installation and verify that you have the latest Common Debug Architecture run time installed.

#### CDA0012

### The debug file string cannot be opened for reading.

# **Explanation**

The file permissions for the debug file do not have read permissions set.

In the message text:

string is the debug file name.

# **User response**

Ensure the debug file exists and that it has read permissions set.

#### **CDA0013**

The module map file string cannot be opened for writing.

# **Explanation**

The file or directory permissions for the module map file do not have write permissions set.

In the message text:

string is the module map file.

### User response

Ensure the dbgld command is being run from a directory with write permission, and the file has write permission if it already exists.

# **CDA0014**

The input file *string* cannot be processed due to the EDIT=NO attribute.

### **Explanation**

dbgld cannot process modules that have been bounded with the EDIT=NO option.

In the message text:

string is the file name of the input module.

### **User response**

Specify binder option EDIT=YES when binding the module.

#### **CDA0015**

The input file string cannot be processed.

# **Explanation**

The BINDER API has failed while processing the input module.

In the message text:

string is the file name of the input module.

# **User response**

Refer to the Program Management documentation for information about the BINDER API return code and reason code.

#### **CDA0016**

The object file produced from string contains ISD debug information.

# **Explanation**

The dbgld command is converting ISD debug information into DWARF debug information. This process may degrade the performance of the dbgld command.

In the message text:

string is the source file name.

# **User response**

To increase the performance of the dbgld command, please recompile the specified source file with the -g compiler option, rebind your application, and then reissue the dbgld command.

#### **CDA0017**

The debug side file string is outdated.

# **Explanation**

The MD5 signature within the specified debug side file does not match the MD5 signature within the input module.

In the message text:

string is the debug side file name.

### User response

Recompile the corresponding source file, rebind your application, and then reissue the dbgld command.

#### **CDA0018**

An error has occurred while processing the ISD debug information for string.

## **Explanation**

The dbgld command is unable to convert the ISD debug information into DWARF debug information.

In the message text:

string is the source file name.

# **User response**

Recompile the specified source file with the -g compiler option, rebind your application, and then reissue the dbgld command. If this is not a viable option, please contact the IBM service representative responsible for your installation.

#### **CDA0019**

An error has occurred while processing the DWARF debug information for *string*.

# **Explanation**

The dbgld command is unable to process the DWARF debug information in the specified debug side file.

In the message text:

string is the debug side file name.

# **User response**

This is an internal error. Provide the indicated error text to the IBM service representative responsible for your installation.

#### CDA0020

The source file string cannot be opened for reading.

### **Explanation**

Either the source file does not exist, or the file permissions for the source file do not have read permissions set. The contents of the source file will not be added to the module map.

In the message text:

string is the source file name.

# **User response**

Ensure the source file exists and that it has read permissions set.

#### **CDA0021**

Error writing to module map file string.

### **Explanation**

There may be insufficient disk space to write to the file.

In the message text:

string is the module map file.

#### **User response**

Ensure there is enough disk space available.

### **FOMC**

### **FOMC2800**

Usage: chcp [-q|-r] chcp [-s] -a ASCII\_cp chcp [-s] -e EBCDIC\_cp chcp [-s] -a ASCII\_cp -e EBCDIC\_cp

### **Explanation**

This message shows the correct syntax for the chcp command. It is displayed when incorrect or missing command options are used.

### User response

FOMC2801

-string is an unknown chcp command option.

# **Explanation**

The chcp command does not recognize the command-line option displayed in the message.

In the message text:

### -string

The unknown option flag specified on the chcp command.

# **User response**

Reenter the chcp command with correct command options. For more information about the command, see <a href="https://example.com/chcp-en/">chcp</a> - Set or query ASCII/EBCDIC code pages for the terminal in z/OS UNIX System Services Command Reference.

#### FOMC2802

The -character option appears more than once. All appearances after the first are not accepted.

# **Explanation**

The option displayed in the message appears more than once on the chcp command line. chcp options must be specified only once.

In the message text:

#### -character

The duplicated option flag specified on the chcp command.

# **User response**

### FOMC2803

When using the ASCII code page option (-a), a code page name is required.

## **Explanation**

The -a option was coded on the chcp command line, but no code page name was specified following the -a. When -a is present, a code page name must follow it on the command line. For example: chcp -a IS08859-1 -e IBM-273.

### **User response**

#### **FOMC2804**

When using the EBCDIC code page option (-e), a code page name is required.

### **Explanation**

The -e option was coded on the chcp command line, but no code page name was specified following the -e. When -e is present, a code page name must follow it on the command line. For example: chcp -a IS08859-1 -e IBM-273.

### **User response**

Reenter the chcp command with correct command options. For more information about the command, see <a href="https://creativecommand.com/chcp-ref">chcp</a> - Set or query ASCII/EBCDIC code pages for the terminal in *z/OS UNIX System Services Command Reference*.

**FOMC2805** 

Specify only one of the query (-q), reset (-r), or set (-s) options on the chcp command line.

# **Explanation**

More than one main operation (-q, -r, or -s) was requested on the chcp command line. The chcp command can perform only one of the query, reset, or set operations each time it is run.

# **User response**

**FOMC2806** 

"-e string" specifies the name of an ASCII code page. An EBCDIC code page is required.

# **Explanation**

The code page that follows the -e option flag must be an EBCDIC code page. The code page entered on the command line following -e is an ASCII code page.

In the message text:

"-e string"

The name of the ASCII code page.

# **User response**

Reenter the chcp command with correct command options. For more information about the command, see <a href="https://creativecommand.com/chcp-align="chc-align="chcp-align="chcp-align="chcp-align="chc-align="chc-align="chcp-align="chc-a

**FOMC2807** 

"-a string" specifies the name of an EBCDIC code page. An ASCII code page is required.

# **Explanation**

The code page that follows the -a option flag must be an ASCII code page. The code page entered on the command line following -a is an EBCDIC code page.

In the message text:

"-a string"

The name of the EBCDIC code page.

#### User response

**FOMC2808** 

number positional parameters starting with "string" are not accepted.

# **Explanation**

Two or more positional parameters were entered on the chcp command line following the option flags (if any). The message shows the first positional parameter on the command line. The chcp command does not accept any positional parameters.

In the message text:

#### number

The number of positional parameters specified on the chcp command line.

### "string"

The text of the first positional parameter.

# **User response**

Reenter the chcp command with correct command options. For more information about the command, see <a href="https://creativecommand.com/chcp-ac-chcp">chcp</a> - Set or query ASCII/EBCDIC code pages for the terminal in z/OS UNIX System Services Command Reference.

FOMC2809

Positional parameter "string" is not accepted.

# **Explanation**

One positional parameter was entered on the chcp command line following the option flags (if any). This positional parameter is shown in the error message. The chcp command does not accept any positional parameters.

In the message text:

### "string"

The text of the positional parameter.

# **User response**

**FOMC2810** 

The ASCII code page option (-a) must not be specified with the query (-q), or reset (-r) options.

# **Explanation**

The ASCII code page option (-a) was present on the chcp command line along with either the query (-q) or reset (-x) options. The -a option can be used only when the set option (-s) is present or defaulted. Do not specify either -a or -e when performing a query or reset operation.

# **User response**

Reenter the chcp command with correct command options. For more information about the command, see <a href="https://creativecommand.com/chcp-align="chc-align="chcp-align="chcp-align="chcp-align="chc-align="chc-align="chcp-align="chc-a

FOMC2811

The EBCDIC code page option (-e) must not be specified with the query (-q), or reset (-r) options.

# **Explanation**

The EBCDIC code page option (-e) was present on the chcp command line along with either the query (-q) or reset (-x) options. The -e option can be used only when the set option (-s) is present or defaulted. Do not specify either -a or -e when performing a query or reset operation.

### **User response**

**FOMC2812** 

When the set option (-s) is specified or defaulted, either the ASCII code page option (-a) or the EBCDIC code page option (-e) is required.

# **Explanation**

The set option (-s) was used, but no ASCII or EBCDIC code pages were specified on the command line. When the chcp -s option is used, either the ASCII code page (-a ASCII\_CP), the EBCDIC code page (-e EBCDIC\_CP), or both code pages must be specified on the command line.

# **User response**

FOMC2813

The name for code page "string" contains more than number characters.

# **Explanation**

The maximum length for chcp code page names is shown in the error message. The ASCII or EBCDIC code page name specified on the command line is too long. Code pages with shorter names must be used.

In the message text:

#### "string"

The code page name that is too long.

#### number

The maximum number of characters allowed in a code page name.

# **User response**

**FOMC2814** 

An unexpected error occurred. error code = number, error data = "string"

# **Explanation**

An unexpected error occurred while chcp was running. This is an internal error. It is not caused by incorrect command syntax or I/O errors.

In the message text:

#### error code = *number*

The code that identifies this unexpected error.

### error data = "number"

Error data that is associated with this error. If the string is empty, there is no data associated with this error.

#### System programmer response

This message indicates that there is a problem in the chcp command. Follow the usual procedures for reporting problems in z/OS UNIX.

### **User response**

Report this error to the system programmer.

FOMC2815

The chcp command cannot obtain *number* bytes of storage required for processing.

# **Explanation**

The chcp command could not obtain enough storage to run. The chcp command ends immediately whenever this happens.

In the message text:

#### number

The number of bytes of storage that chcp requested.

# System programmer response

Make sure that the address spaces used by shell commands have enough storage to run the chcp command.

### **User response**

Report this error to the system programmer.

#### FOMC2821

The chcp command failed. The name of the controlling terminal cannot be determined. function = ctermid(), pathname = ""

# **Explanation**

The chcp command cannot determine the name of the controlling terminal. No code page operations are possible without the name of the controlling terminal.

# System programmer response

For more information about this error, see z/OS XL C/C++ Language Reference. Follow any problem determination procedures suggested for the ctermid() output pathname shown in the error message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

### **User response**

Report this error to the system programmer.

#### **FOMC2822**

The chcp command failed. The controlling terminal cannot be used. function = open(), pathname = "string", return value = number, errno = number (X'hexnum'), reason code = hexnum, message = "string"

# **Explanation**

The chcp command cannot open the controlling terminal. No code page operations are possible if the controlling terminal cannot be opened.

In the message text:

# pathname = "string"

The pathname of the controlling terminal

### return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

# reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = "string"

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

For more information about this error, see <u>z/OS C/C++ Runtime Library Reference</u> and <u>z/OS UNIX System Services</u> <u>Programming: Assembler Callable Services Reference</u>. Follow any problem determination procedures suggested for the error value and the other error information shown in the message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

## **User response**

Report this error to the system programmer.

### **FOMC2823**

This terminal does not support the chcp command.

# **Explanation**

The chcp command cannot be used on this terminal. The terminal does not support code page operations. If you are logged on through the TSO/E OMVS command, the chcp command is not supported.

# **User response**

Do not run the chcp command when using this terminal.

To avoid this message when chcp is invoked from a shell script, and you are logged on through the TSO/E OMVS command, test the \_BPX\_TERMPATH environment variable. If this environment variable is set to OMVS, bypass the running of the chcp command. For more information about \_BPX\_TERMPATH, see \_BPXK environment variables in z/OS UNIX System Services Planning.

#### FOMC2824

The chcp command failed. The code page capability for this terminal is unknown. function = \_\_tcgetcp(), file descriptor = number, pathname = "string", return value = number, errno = number (X'hexnum'), reason code = hexnum, message = "string"

# **Explanation**

The chcp command tried to determine the current code pages for the terminal. The \_\_tcgetcp() function failed with the errno and reason code in the error message. The chcp command ended immediately.

In the message text:

#### file descriptor = *number*

The file descriptor of the controlling terminal.

#### pathname = "string"

The pathname of the controlling terminal.

#### return value = *number*

The return value reported by the system for this error.

#### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

#### message = "string"

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

### System programmer response

For more information about this error, see <u>z/OS C/C++ Runtime Library Reference</u>. Follow any problem determination procedures suggested for the errno value and the other error information shown in the message.

Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

## **User response**

Report this error to the system programmer.

FOMC2825

The ASCII code page was not changed. The current EBCDIC code page is not set.

## **Explanation**

chcp was run with just the ASCII code page (-a ASCII\_cp) specified on the command line. The current EBCDIC code page for the terminal is not known, because the terminal is in binary mode. Whenever the chcp command is run and the terminal is in binary mode, both the ASCII and EBCDIC code pages must be specified on the command line. The code pages were not changed.

## **User response**

Reenter the chcp command with both the ASCII code page (-a ASCII\_cp) and the EBCDIC code page (-e EBCDIC\_cp) on the command line. When the terminal is in binary mode, chcp -r can also be used to reset both code pages to the default values.

**FOMC2826** 

The EBCDIC code page was not changed. The current ASCII code page is not set.

## **Explanation**

chcp was run with just the EBCDIC code page (-e EBCDIC\_cp) specified on the command line. The current ASCII code page for the terminal is not known, because the terminal is in binary mode. Whenever the chcp command is run and the terminal is in binary mode, both the ASCII and EBCDIC code pages must be specified on the command line. The code pages were not changed.

## **User response**

Reenter the chcp command with both the ASCII code page (-a ASCII\_cp) and the EBCDIC code page (-e EBCDIC\_cp) on the command line.

FOMC2827

The code pages were not changed. ASCII code page "string" cannot be used with EBCDIC code page "string" on this terminal.

## **Explanation**

The ASCII and EBCDIC code pages shown in the error message cannot be used together on this terminal. If the ASCII code page is IBM-932 or IBM-eucJP, the EBCDIC code page must be IBM-939. If the EBCDIC code page is IBM-939, the ASCII code page must be IBM-932 or IBM-eucJP. The code pages were not changed.

#### **User response**

Make sure to use only the allowed DBCS code pages on this terminal. Reenter the chcp command with the correct ASCII and EBCDIC DBCS code pages.

FOMC2831

The code pages were not changed. The specified ASCII and EBCDIC code pages cannot be used together. function = iconv\_open(), tocode = "string", fromcode = "string", return value = number, errno = number (X'hexnum'), reason code = hexnum, message = "string"

The ASCII and EBCDIC code pages shown in the message cannot be used together. It is not possible to convert between these two code pages. The code pages were not changed.

In the message text:

#### tocode = string

The target code page passed to iconv\_open().

## fromcode = string

The source code page passed to iconv open().

#### return value = *number*

The return value reported by the system for this error.

#### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

#### message = "string"

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## System programmer response

For more information about this error, see <u>z/OS C/C++ Runtime Library Reference</u> and <u>z/OS UNIX System Services</u> <u>Programming: Assembler Callable Services Reference</u>. Follow any problem determination procedures suggested for the error value and the other error information shown in the message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

## User response

Make sure the code pages shown in the error message are correct. If not, reenter the chcp command using the -a *ASCII\_cp* and -e *EBCDIC\_cp* options to specify the correct code pages.

If the code pages are correct, report this error to the system programmer.

#### **FOMC2832**

The code pages were not changed. Conversion from the ASCII code page to the EBCDIC code page cannot be set up. function = iconv(), ASCII code page = "string", EBCDIC code page = "string", input bytes left = number, output bytes left = number, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = "string"

## **Explanation**

The chcp command must build the ASCII to EBCDIC conversion table for this terminal. Both code pages contain single-byte codes, but chcp could not set up a 256-byte character conversion table. Either iconv() failed with the errno and reason code in the message, or the tables output from iconv() were not 256 bytes long. The code pages were not changed.

In the message text:

## ASCII code page = "string"

The requested ASCII code page.

## EBCDIC code page = "string"

The requested EBCDIC code page.

#### input bytes left = *number*

The number of ASCII code points that can not be converted.

#### output bytes left = *number*

The number of EBCDIC code points that are not used.

#### return value = *number*

The return value reported by the system for this error.

## errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see  $\underline{z/OS}$  UNIX System Services Programming: Assembler Callable Services Reference.

## message = "string"

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

For more information about this error, see <u>z/OS C/C++ Runtime Library Reference</u> and <u>z/OS UNIX System Services Programming: Assembler Callable Services Reference</u>. Follow any problem determination procedures suggested for the error value and the other error information shown in the message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

## **User response**

Make sure the code pages shown in the error message are correct. If not, reenter the chcp command using the -a *ASCII\_cp* and -e *EBCDIC\_cp* options to specify the correct code pages.

If the code pages are correct, report this error to the system programmer.

#### FOMC2833

The code pages were not changed. Conversion from the EBCDIC code page to the ASCII code page cannot be set up. function = iconv(), ASCII code page = "string", EBCDIC code page = "string", input bytes left = number, output bytes left = number, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = "string"

# **Explanation**

The chcp command must build the EBCDIC to ASCII conversion table for this terminal. Both code pages contain single-byte codes, but chcp could not set up a 256-byte character conversion table. Either iconv() failed with the errno and reason code in the message, or the tables output from iconv() were not 256 bytes long. The code pages were not changed.

In the message text:

## ASCII code page = "string"

The requested ASCII code page.

## EBCDIC code page = "string"

The requested EBCDIC code page.

## input bytes left = *number*

The number of EBCDIC code points that can not be converted.

#### output bytes left = *number*

The number of ASCII code points that are not used.

#### return value = *number*

The return value reported by the system for this error.

#### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

## message = "string"

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## System programmer response

For more information about this error, see <u>z/OS C/C++ Runtime Library Reference</u> and <u>z/OS UNIX System Services Programming: Assembler Callable Services Reference</u>. Follow any problem determination procedures suggested for the error value and the other error information shown in the message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

## **User response**

Make sure the code pages shown in the error message are correct. If not, reenter the chcp command using the -a *ASCII\_cp* and -e *EBCDIC\_cp* options to specify the correct code pages.

If the code pages are correct, report this error to the system programmer.

#### **FOMC2834**

The ASCII and EBCDIC code pages cannot be changed. function = \_\_tcsetcp(), ASCII code page = "string", EBCDIC code page = "string", file descriptor = number, pathname = "string", return value = number, errno = number (X'hexnum'), reason code = hexnum, message = "string"

## **Explanation**

The chcp command cannot change the code pages for the terminal. The \_\_tcsetcp() function failed with the errno value and reason code shown in the message.

In the message text:

#### file descriptor = *number*

The file descriptor of the controlling terminal.

## ASCII code page = "string"

The requested ASCII code page.

## EBCDIC code page = "string"

The requested EBCDIC code page.

## pathname = "string"

The pathname of the controlling terminal.

## return value = *number*

The return value reported by the system for this error.

#### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

#### message = "string"

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## System programmer response

For more information about this error, see z/OS C/C++ Runtime Library Reference and z/OS UNIX System Services Programming: Assembler Callable Services Reference. Follow any problem determination procedures suggested

for the errno value and the other error information shown in the message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

## **User response**

Report this error to the system programmer.

#### FOMC2835

The ASCII and EBCDIC code pages and tables cannot be changed. function = \_\_tcsettables(), ASCII code page = "string", EBCDIC code page = "string", file descriptor = number, pathname = "string", return value = number, errno = number (X'hexnum'), reason code = hexnum, message = "string"

# **Explanation**

The chcp command cannot change the code pages for the terminal. The \_\_tcsettables() function failed with the errno value and reason code shown in the message.

In the message text:

#### file descriptor = *number*

The file descriptor of the controlling terminal.

## ASCII code page = "string"

The requested ASCII code page.

## EBCDIC code page = "string"

The requested EBCDIC code page.

## pathname = "string"

The pathname of the controlling terminal.

#### return value = *number*

The return value reported by the system for this error.

#### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

## message = "string"

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## System programmer response

For more information about this error, see *z/OS C/C++ Runtime Library Reference* and *z/OS UNIX System Services Programming: Assembler Callable Services Reference*. Follow any problem determination procedures suggested for the error value and the other error information shown in the message. Additional error messages may appear on the system console when this error occurs. If so, also follow any user responses for those messages.

## **User response**

Report this error to the system programmer.

#### **FOMF**

## **FOMF0100I**

Cannot open message catalog

## **Explanation**

The message catalog fomfmsgc.cat cannot be opened.

# **System action**

The command will proceed using default messages.

## **User response**

Set your NLS environment variables to be consistent with a language feature installed on your system.

#### FOMF0101I

filename is empty or cannot be read

# **Explanation**

The automount master file could not be read or is an empty file.

# **System action**

The automount configuration was not changed.

## **User response**

Create a /etc/auto.master file or specify a path name for the automount master file as the command argument.

**FOMF0102I** 

Usage: automount [-aeqs] [master\_file\_name]automount -f file\_system\_name

# **Explanation**

The usage message displays the correct syntax for the automount command. Only one option flag can be specified.

## **System action**

The automount configuration was not changed.

## **User response**

Reenter the automount command using the correct syntax.

#### **FOMF0103I**

Nothing to configure for file filename

## **Explanation**

The specified map file did not contain any configuration information.

## **System action**

This map file did not change the automount configuration.

## User response

Delete the filename from /etc/auto.master or include configuration data in the file.

FOMF0104I

Directory does not exist: directory-name

The directory that you specified does not exist.

# **System action**

The specified directory is not configured for automount.

## **User response**

Create the directory and reenter the command.

FOMF0105I

Line line-number: NAME keyword expected

## **Explanation**

The NAME keyword must be the first keyword in a map file.

# **System action**

This map file does not change the automount configuration.

## **User response**

Correct the specifications in the map file named in the previous FOMF0107I message.

**FOMF0106I** 

Line line-number: Invalid keyword: name

## **Explanation**

This symbol is not a valid keyword.

## **System action**

This map file does not change the automount configuration.

## **User response**

Correct the specifications in the map file named in the previous FOMF0107I message.

FOMF0107I

Processing file filename

## **Explanation**

This message names the map file being processed.

## **User response**

None

**FOMF0108I** 

Managing directory directory-name

## **Explanation**

This message names the directory just configured for the automounter.

## **User response**

None

#### **FOMF0109I**

Line line-number: Invalid number: number

## **Explanation**

The symbol is not a valid number or is out of range

# **System action**

This map file does not change the automount configuration.

## **User response**

Correct the specifications in the map file named in the previous FOMF0107I message.

#### **FOMF0110I**

Line line-number: Argument not specified

# **Explanation**

A keyword is missing an argument.

# **System action**

This map file does not change the automount configuration.

## **User response**

Correct the specifications in the map file named in the previous FOMF0107I message.

#### **FOMF0111I**

Line line-number: NAME \* must be the first entry

# **Explanation**

A NAME \* statement was found in the map file but was not the first entry.

# **System action**

This map file does not change the automount configuration.

# **User response**

Correct the specifications in the map file named in the previous FOMF0107I message.

## **FOMF0112I**

**Error issuing PFSCTL: RC=number ERRNO=number REASON=number** 

## **Explanation**

An error occurred when the PFSCTL command was issued. The return codes describe the error.

# **System action**

The automount command terminates.

## **User response**

Correct the error and reenter the command.

## **FOMF0113I**

Directory name too long: directory-name

The name of the directory to be managed by the automounter cannot contain more than 40 characters.

## **System action**

The specified directory is not configured for automount.

## **User response**

Rename the directory so it has a shorter pathname or reference the directory through a symbolic link that has a shorter pathname.

#### FOMF0114I

Line line-number: MODE must be RDWR or READ

## **Explanation**

The MODE keyword was not specified correctly.

# **System action**

The specified directory is not configured for automount.

## **User response**

Correct the error and reenter the command.

#### **FOMF0115I**

Line line-number: named-keyword argument is too long

## **Explanation**

The named keyword was not specified correctly.

## **System action**

The specified directory is not configured for automount.

## **User response**

Correct the error and reenter the command.

#### **FOMF0116I**

Line line-number: SETUID must be YES or NO

## **Explanation**

The SETUID keyword was not specified correctly.

## **System action**

The specified directory is not configured for automount.

## **User response**

Correct the error and reenter the command.

## FOMF0117I

Mount failed for directory *directory-name*. Errno=*number* Reason=*number* 

## **Explanation**

The automounter could not mount itself on the specified directory. The error code and reason code are shown.

# **System action**

The specified directory is not configured for automount.

## **User response**

Correct the error and reenter the command.

#### **FOMF0118I**

## Map file not specified for directory directory-name

## **Explanation**

The automount master file contains a pathname for a directory to manage but no filename for the map file.

# **System action**

The automount configuration is not changed.

## **User response**

Correct the error and reenter the command.

#### FOMF0119I

Line line-number: SECURITY must be YES or NO

## **Explanation**

The SECURITY keyword was not specified correctly.

## **System action**

The specified directory is not configured for automount.

## **User response**

Correct the error and reenter the command.

## FOMF0120I

Line line-number: AUTOMOVE must be YES or NO

## **Explanation**

The AUTOMOVE keyword was not specified correctly.

## **System action**

The specified directory is not configured for automount.

## **User response**

Correct the error and reenter the command.

## FOMF0121I

Line line-number: CCSID for TAG is not valid

## **Explanation**

The CCSID decimal value for the TAG keyword has invalid characters or is out of range.

## **System action**

The specified directory is not configured for automount.

## **User response**

Correct the error and reenter the command.

FOMF0122I

Line line-number: TAG must include TEXT or NOTEXT

## **Explanation**

The TAG keyword line must specify TEXT or NOTEXT after the CCSID value and the comma.

# **System action**

The specified directory is not configured for automount.

## **User response**

Correct the error and reenter the command.

**FOMF0123I** 

Line *line-number*: Keyword error in allocation string at word word-number: keyword

## **Explanation**

The allocation string specified on ALLOCUSER or ALLOCANY contains an unidentified word. The word number and word are shown.

# **System action**

The specified directory is not configured for automount.

## User response

Correct the error and reenter the command.

**FOMF0124I** 

Line line-number: LOWERCASE must be YES or NO

## **Explanation**

The LOWERCASE keyword was not specified correctly.

## **System action**

The specified directory is not configured for automount.

## **User response**

Correct the error and reenter the command.

**FOMF0125I** 

**Automount policy was not changed** 

# **Explanation**

The automount policy was not changed due to errors found in the automount policy.

## **System action**

The current automount configuration is not changed.

## **User response**

Correct the errors and reenter the command.

#### FOMF0126I

Line line-number: keyword PATHPERM is not supported.

## **Explanation**

The PATHPERM keyword is not supported for this file system type.

# System action

The automount policy is not changed.

## **User response**

Correct the errors and reenter the command.

#### **FOMF0127I**

Line line-number:keyword PATHPERM has an invalid value.

## **Explanation**

The PATHPERM keyword only supports the digits 0-7.

# System action

The automount policy is not changed.

## **User response**

Correct the errors and reenter the command.

# FOMF0128I

Line line-numberLOWERCASE and CHARCASE mutually exclusive

# **Explanation**

The LOWERCASE keyword is mutually exclusive with the CHARCASE keyword.

## **System action**

The automount policy is not changed.

## **User response**

Correct the errors and reenter the command.

## FOMF0129I

Line line-number CHARCASE must be UPPER, LOWER, or ASIS.

# **Explanation**

The CHARCASE keyword must be specified as UPPER, LOWER, or ASIS.

## **System action**

The automount policy is not changed.

## **User response**

Correct the errors and reenter the command.

#### **FOMF0130I**

Error issuing command: reason

## **Explanation**

The TSO/E command could not be issued through OMVS. *Reason* provides additional information about the failure.

# System action

The TSO/E command is not run.

# **User response**

Correct the problem and try again or use the -t option.

## FOMF0131I

## FOMF0131I Allocation for SYSTSIN failed

## **Explanation**

The SYSTSIN DD name could not be allocated. An allocation failure message precedes this message with information about the allocation failure.

# **System action**

The TSO/E command is not run.

# **User response**

Correct the problem and try again.

## **FOMF0132I**

#### **Allocation for SYSTSPRT failed**

## **Explanation**

The SYSTSPRT DD name could not be allocated. An allocation failure message precedes this message with information about the allocation failure.

## **System action**

The TSO/E command is not run.

## **User response**

Correct the problem and try again.

## FOMF0133I

## TSO Environment service failed: reason

## **Explanation**

The TSO environment could not be established. Reason provides more information about the failure.

## **System action**

The TSO/E command is not run.

## **User response**

Correct the problem and try again.

#### **FOMF0134I**

TSOLNK failed: reason

## **Explanation**

The TSO service routine could not be invoked. Reason provides more information about the failure.

## **System action**

The TSO/E command is not run.

## **User response**

Correct the problem and try again.

## FOMF0135I

Command too long or all blanks

# **Explanation**

The argument was either not specified or contains more than 32,768 characters.

## **System action**

The TSO/E command is not run.

## User response

Correct the problem and try again.

#### **FOMF0136I**

**Command not found** 

## **Explanation**

The TSO/E command specified in the argument was not found.

# **System action**

The TSO/E command is not run.

## **User response**

Correct the problem and try again.

#### FOMF0137I

**Command syntax error** 

## **Explanation**

The TSO/E command specified in the argument does not have correct syntax.

## **System action**

The TSO/E command is not run.

## **User response**

Correct the problem and try again.

#### **FOMF0138I**

## **Command not supported in background**

# **Explanation**

The TSO/E command specified in the argument is not supported in a TSO/E background environment.

## **System action**

The TSO/E command is not run.

## **User response**

This command cannot be run with the tso utility using the -t option. Try to use the -o option.

#### FOMF0139I

#### **Authorized commands are not supported**

# **Explanation**

The TSO/E command specified in the argument is not supported through the TSO/E environment service.

# **System action**

The TSO/E command is not run.

## **User response**

This command cannot be run with the tso utility using the -t option. Try to use the -o option.

## **FOMF0140I**

## **Invalid option specified**

# **Explanation**

An unsupported option was specified.

## **System action**

The TSO/E command is not run.

## **User response**

Specify a valid option. The supported options are -t and -o.

## **FOMF0141I**

## Unable to set 3270 passthrough mode

## **Explanation**

The controlling pseudo-tty does not support 3270 passthrough mode or there is no controlling pseudo-tty and the -o option was specified.

# **System action**

The TSO/E command is not run.

## **User response**

Reenter the command using the -t option.

#### FOMF0142I

Command abended: reason

## **Explanation**

The TSO/E command abended. Reason provides more information about the abend.

## **User response**

Correct the problem and try again.

#### FOMF0143I

Terminated by signal signal\_number

# **Explanation**

The tso shell command terminated due to a signal.

**FOMF0144I** 

Fork failed: reason

# **Explanation**

The **tso** shell command attempted to fork() and the fork failed. *Reαson* provides more information about the failure.

## **User response**

Correct the problem and try again.

FOMF0145I

Data set not allocated to DD\_name: data\_set

## **Explanation**

The data set could not be allocated to the DD name. An allocation failure message precedes this message with information about the allocation failure.

# **System action**

The TSO/E command is not run.

## **User response**

Correct the problem and try again.

**FOMF0161I** 

No information found.

## **Explanation**

This is the output of the -f file\_system\_name. There is no information found for the specified file system.

## **System action**

No system action is taken.

## **User response**

No user response is needed.

FOMF0164I

File system name too long

## **Explanation**

The specified file system name is longer than the maximum allowed, which is 44 characters.

## **System action**

No system action is taken.

## **User response**

Change the file system name to a name that is 44 characters or less in length.

## FOMF0165I

Error issuing syscall: RC=number ERRNO=number REASON=number

## **Explanation**

An error occurred when a syscall command was issued. The return code describes the error.

#### syscall

The name of the syscall command.

## **System action**

The automount command terminates.

## **User response**

Correct the error and reenter the command.

## FOMF0166I

line\_number: Expect a line after the continuation character

# **Explanation**

The last line has a continuation character.

# **System action**

This map file does not change the automount configuration.

## **User response**

Correct the error and reenter the command.

## FOMF0201I

Usage: configstk [-s] [config\_file\_name]

## **Explanation**

The usage message displays the correct syntax for the **configstk** command.

## **System action**

The configuration was not changed.

## **User response**

Reenter the configstk command using the correct syntax.

#### FOMF0202I

file is empty or cannot be read

## **Explanation**

The configuration file could not be read or is an empty file.

## **System action**

The configuration was not changed.

## **User response**

Reenter the configstk command specifying a correct pathname for the configuration file.

#### FOMF0203I

Error issuing PFSCTL: RC=number ERRNO=number REASON=number

## **Explanation**

An error occurred when the PFSCTL command was issued. The return codes describe the error.

# System action

The configstk command terminates.

## **User response**

Correct the error and reenter the command.

#### **FOMF0204I**

Line line-number: Invalid device number

## **Explanation**

Device numbers must be specified as four hex digits and the number must be an even number.

## **System action**

The configuration is not changed.

## **User response**

Correct the error and reenter the command.

# FOMF0205I

Line line-number: Duplicate device address

# **Explanation**

Cannot duplicate device addresses.

## **System action**

The configuration is not changed.

## **User response**

Correct the error and reenter the command.

## FOMF0206I

Line line-number: Invalid arguments

# **Explanation**

Unexpected text was found on a HOME or GATEWAY statement.

## **System action**

The configuration is not changed.

40 z/OS: z/OS UNIX System Services Messages and Codes

## **User response**

Correct the error and reenter the command.

#### FOMF0207I

## Too many addresses specified for device device-name

## **Explanation**

No more than 256 IP addresses can be specified for a device.

# **System action**

The configuration is not changed.

## **User response**

Correct the error and reenter the command.

## FOMF0208I

Line line-number: Invalid HOME IP address

## **Explanation**

The IP address on the HOME statement is not in the proper format for an IP address.

## **System action**

The configuration is not changed.

## **User response**

Correct the error and reenter the command.

## FOMF0209I

Line line-number: Invalid or missing BUFFERS keyword

## **Explanation**

BUFFERS must be specified on the HOME statement.

# **System action**

The configuration is not changed.

## **User response**

Correct the error and reenter the command.

#### **FOMF0211I**

Line line-number: Duplicate HOME keyword

## **Explanation**

Only one HOME statement can be specified in the configuration file.

## **System action**

The configuration is not changed.

## **User response**

Correct the error and reenter the command.

#### **FOMF0212I**

Line line-number: Invalid keyword: keyword

# **Explanation**

A keyword was expected but not found.

## System action

The configuration is not changed.

## **User response**

Correct the error and reenter the command.

## **FOMF0213I**

**HOME** keyword must be specified

## **Explanation**

One HOME statement must be specified in the configuration file.

# **System action**

The configuration is not changed.

## **User response**

Correct the error and reenter the command.

## **FOMF0214**

Too many IP addresses specified

# **Explanation**

The configuration file cannot contain more than 256 IP addresses.

## **System action**

The configuration is not changed.

## **User response**

Correct the error and reenter the command.

## FOMF0215I

Too many devices specified

## **Explanation**

The configuration file cannot contain more than 32 GATEWAY statements.

# **System action**

The configuration is not changed.

## **User response**

Correct the error and reenter the command.

## FOMF0216I

At least one IP address must be specified for device device-type

Each GATEWAY statement must be followed by a list of at least one IP address.

# **System action**

The configuration is not changed.

## **User response**

Correct the error and reenter the command.

#### **FOMF0217I**

Line *line-number*: Duplicate IP address

## **Explanation**

The same IP address cannot appear twice in the configuration file.

# **System action**

The configuration is not changed.

## **User response**

Correct the error and reenter the command.

## FOMF0218I

Line line-number: Missing CHECKSUM or NOCHECKSUM keyword

## **Explanation**

CHECKSUM or NOCHECKSUM must be specified on the GATEWAY statement.

## **System action**

The configuration is not changed.

## **User response**

Correct the error and reenter the command.

## FOMF0219I

**Error processing device device: Reason code=number** 

## **Explanation**

An error occurred when configuring the device. The reason code describes the error.

## **System action**

This device is not configured.

## **User response**

Correct the error and reenter the command.

## FOMF0220I

Unable to locate active configuration

# **Explanation**

An error occurred while attempting to access the configuration.

## **System action**

The command terminates.

## **User response**

Ensure a configuration has been activated.

FOMF0221I

buffer-type Buffers allocated: number of maximum-number

## **Explanation**

This displays the number of read or write buffers that are allocated and the maximum number that can be allocated.

**FOMF0301I** 

Usage: extattr [+alps] [-alps] [-F NA | BIN | NL | CR | LF | CRLF | LFCR | CRNL | REC] file ...

# **Explanation**

The usage message displays the correct syntax for the **extattr** command.

# **System action**

No file attributes were changed.

# **User response**

Reenter the **extattr** command using the correct syntax.

FOMF0302I

filename: File not found

## **Explanation**

The file does not exist.

# **System action**

Attributes for the file were not changed.

## **User response**

Reenter the extattr command using a correct filename.

FOMF0303I

filename: service error: rv=number, errno=number, rsn=number

## **Explanation**

An error was encountered processing *filename* issuing a *service* call. The return codes describe the error.

## **System action**

No file attributes were changed.

## **User response**

Correct the error and reenter the **extattr** command.

FOMF0307I

Attributes not set: filename

Specified attributes for the file filename could not be set.

# **System action**

No file attributes were changed.

## **User response**

Ensure you have authority to set the attributes and the file is a regular file.

**FOMF0308I** 

filename: Not a regular file

# **Explanation**

Specified attributes for the file *filename* could not be set.

# **System action**

No file attributes were changed.

## **User response**

Only set extended attributes on regular files.

FOMF0310I

File Format Flag is not set: filename

## **Explanation**

Specified format flag for the file filename could not be set.

## **System action**

No file format options were changed.

## **User response**

Ensure you have authority to set the attributes and the file is a regular file.

FOMF0331I

Usage: filecache [-a filename...] filecache [-d filename...] filecache [-p|-q|-r]

## **Explanation**

Incorrect syntax was used on the **filecache** command.

## **System action**

No files were cached.

## **User response**

Reenter the **filecache** command using the correct syntax.

FOMF0332I

**Conflicting options** 

## **Explanation**

Conflicting options were specified on the **filecache** command line.

## **System action**

Files were not cached.

## **User response**

Reenter the **filecache** command using the correct options.

## FOMF0333I

Error issuing PFSCTL: RC=number ERRNO=number REASON=number

## **Explanation**

An error occurred when the PFSCTL command was issued. The return codes describe the error.

# System action

The **filecache** command terminates.

## **User response**

Correct the error and reenter the command.

**FOMF0334I** 

filename: file must be an existing regular file

## **Explanation**

Only regular files that already exist can be cached.

# **System action**

The file was not cached.

## **User response**

Reenter the filecache command naming a regular file.

FOMF0401I

Maximum storage allocation is numberK

## **Explanation**

Shows the maximum amount of storage that can be used by STREAMS message blocks.

FOMF0402I

The current storage allocation is numberK

## **Explanation**

Shows the current amount of storage that is in use for STREAMS message blocks.

FOMF0501I

Async mount proceeding for file-system-name

# **Explanation**

The mount command was accepted and will complete later.

**FOMF0502I** 

Mount complete for file-system-name

## **Explanation**

The mount command completed without error.

FOMF0503I

Error invoking service-name: return-code

The named service call failed with the printed return code.

**FOMF0504I** 

service-name error: error-number reason-code

## **Explanation**

The named service call failed with the printed return value and reason code. If diagnostic information is available for these error codes it will follow this message in English.

FOMF0505I

number file systems could not be accessed

## **Explanation**

Some file systems could not be accessed.

## **User response**

Rerun the command with superuser authority.

**FOMF0506I** 

Usage: mount [-t fstype] [-o fsoptions] [-d destsys] [-a yes|no|unmount| include, sysname,...|exclude, sysname,...] [-s nosecurity|nosetuid] [-c ccsid,text|notext] [-w time] -f fsname pathname

## **Explanation**

This is the syntax description for the mount command.

**FOMF0507I** 

mount -q [-v] [-d destsys] pathname...

## **Explanation**

This is a continuation of message FOMF0506I

FOMF0508I

Enter Y to proceed with unmount or N to end program

# **Explanation**

-p was specified for prompt mode on the unmount command and a file system is about to be unmounted.

FOMF0509I

Asynchronous mount failed for file-system

## **Explanation**

Asynchronous mount processing failed within the specified time.

FOMF0510I

Wait time expired. Async mount proceeding for file-system

## **Explanation**

Specified wait time expired. Asynchronous mount still proceeding.

**FOMF0510I** 

Path is not a mountpoint: path-name

## **Explanation**

The path name specified is not a mountpoint and the -m option flag was not specified.

FOMF0521I

Usage: unmount [-R|f] [-vp] [-o unmount\_option] name

This is the syntax description for the unmount command.

FOMF0531I

Usage: chmount [-DRrws] [-d sysname] [-a yes|no|unmount|include, sysname,...|exclude, sysname,...] path

## **Explanation**

This is the syntax description for the **chmount** command.

## **FOMI**

FOMI messages are issued by the **ipcs** and **ipcrm** shell commands.

FOMI1076I

ipcrm could not remove IPC member

## **Explanation**

The requested message queue, semaphore set, or shared memory identifier could not be removed. Possible causes include:

- The IPC ID or key value specified on the command line is incorrect.
- The user ID does not have permission to remove the requested IPC member.

The ipcrm command got an error return code from shmctl(), msgctl(), or semctl().

## **User response**

Make sure that the correct IPC key or ID is entered on the command line. Issue ipcrm from a user ID that has authority to remove the requested message queue, semaphore set, or shared memory identifier.

## **FOMN**

FOMN0001

usage: pgm -d conf

## **Explanation**

inetd was invoked with an invalid option. inetd displays the correct usage.

In the message text:

pgm

The program name - normally inetd.

## **System action**

inetd terminates.

## System programmer response

Invoke inetd with the correct syntax.

**FOMN0003** 

Sigaction for SIGALRM failed: errdesc, rsn=reason\_code

## **Explanation**

inetd was not able to set up a signal handler for SIGALRM.

In the message text:

#### errdesc

Error description associated with the errno returned from sigaction().

The reason code returned from sigaction().

## **System action**

inetd continues but may later terminate or not correctly initialize if TCP/IP is not already initialized or if TCP/IP is later restarted.

## System programmer response

Contact IBM support.

#### **FOMN0004**

Sigaction for SIGHUP failed: errdesc, rsn=reason\_code

## **Explanation**

inetd was not able to set up a signal handler for SIGHUP.

In the message text:

#### errdesc

Error description associated with the errno returned from sigaction().

The reason code returned from sigaction().

## **System action**

inetd continues but will terminate if later sent a SIGHUP signal, rather than reinitializing.

## System programmer response

Contact IBM support.

#### **FOMN0005**

Sigaction for SIGCHLD failed: errdesc, rsn=reason\_code

## **Explanation**

inetd was not able to set up a signal handler for SIGCHLD.

In the message text:

## errdesc

Error description associated with the errno returned from sigaction().

#### reason code

The reason code returned from sigaction().

## **System action**

inetd continues but will not monitor the termination of child processes. Child processes may become zombies and certain internal services will not process multiple requests.

## System programmer response

Contact IBM support.

**FOMN0006** 

Sigaction for SIGTERM failed: errdesc, rsn=reason\_code

## **Explanation**

inetd was not able to set up a signal handler for SIGTERM.

In the message text:

#### errdesc

Error description associated with the errno returned from sigaction().

#### reason\_code

The reason code returned from *sigaction()*.

## **System action**

inetd continues, but will terminate immediately if sent a SIGTERM signal rather than terminating cleanly.

## System programmer response

Contact IBM support.

#### **FOMN0007**

Sigaction for SIGINT failed: errdesc, rsn=reason\_code

# **Explanation**

inetd was not able to set up a signal handler for SIGINT.

In the message text:

#### errdesc

Error description associated with the errno returned from sigaction().

#### reason code

The reason code returned from *sigaction()*.

## **System action**

inetd continues, but will terminate immediately if sent a SIGINT signal rather than terminating cleanly.

## **System programmer response**

Contact IBM support.

#### **FOMN0008**

select: errdesc, rsn=reason\_code

## **Explanation**

An error, other than EINTR, was returned on the *select()* inetd issues against the sockets descriptors for the services listed in the configuration file.

In the message text:

#### errdesc

Error description associated with the errno returned from *select()*.

#### reason\_code

The reason code returned from *select()*.

## **System action**

If the errno returned is EMVSERR, and the reason code is JrTcpError, or the ERRNO is EIO, inetd assumes that TCP/IP terminated or a new stack has been started, issues message FOMN0009 and attempts to reinitialize the sockets. For other errors, inetd terminates.

## System programmer response

If inetd terminates, contact IBM support.

#### **FOMN0009**

## **TCP/IP TERMINATED**

## **Explanation**

inetd has received an error indication which is interpreted as indicating that TCP/IP has terminated or that a new stack has been started. This message is preceded by one or more other messages indicating what error was received.

## **System action**

inetd attempts to reinitialize the sockets for the services in the configuration file. If that fails, inetd attempts to reinitialize the sockets every three minutes.

## System programmer response

Start TCP/IP, if appropriate.

#### **FOMN0010**

#### someone wants service

# **Explanation**

This message is issued only if inetd is started with the debug (-d) option. A request has arrived on the port associated with *service*.

In the message text:

#### service

The name of a service specified in the configuration file.

## **System action**

inetd will process that request, ultimately invoking the program specified for the service in the configuration file.

## System programmer response

None.

#### **FOMN0011**

accept, ctrl sd

## **Explanation**

This message is issued only if inetd is started with the debug (-d) option. An accept() has been issued for the socket associated with a new request. accept() has given a new socket descriptor, sd, allowing the socket associated with the service to continue to be listened to, while the new socket descriptor is used when invoking the service for the new request.

In the message text:

sd

The socket descriptor returned by *accept()*.

## **System action**

If sd is not -1, inetd will continue process that request, ultimately invoking program specified for the service in the configuration file. If sd is -1, an error message may be issued to the syslog daemon and appropriate processing would be done.

## System programmer response

None.

**FOMN0012** 

accept, for service: errdesc, rsn=reason\_code

## **Explanation**

An error was returned on the accept() inetd issued against the socket descriptor for the service.

In the message text:

#### service

The name of a service specified in the configuration file.

#### errdesc

Error description associated with the errno returned from accept().

#### reason\_code

The reason code returned from *accept()*.

# **System action**

If the error returned is EBADF, EMVSERR with a reason of JrTcpError, or EIO, inetd assumes that TCP/IP terminated or a new stack has been started, issues message FOMN0009 and attempts to reinitialize the sockets. For EMFILE, inetd closes the socket associated with service and continues, supporting the remaining services. For other errors, inetd terminates.

## System programmer response

If *errdesc* is associated with EMFILE, increase the maximum files per process (MAXFILEPROC in SYS1.PARMLIB member BPXPRMxx). Note that the maximum can also be changed dynamically with the SETOMVS or SET OMVS command, and can be specified on a per-user basis in RACF. If *errdesc* is associated with EBADF, EMVSERR or EIO, start TCP/IP, if appropriate. If inetd terminates, contact IBM support.

**FOMN0014** 

fork: errdesc, rsn=reason\_code

## **Explanation**

An error was returned on the fork() inetd issued to start a new daemon for a request.

In the message text:

#### errdesc

Error description associated with the errno returned from *fork()*.

#### reason\_code

The reason code returned from fork().

# System action

inetd continues processing, but abandons the current request.

## System programmer response

Contact IBM support.

**FOMN0015** 

getpwnam: username: No such user: errdesc, rsn= reason\_code

## **Explanation**

An error was returned on the *getpwnam()* inetd issued in preparation for setting the proper username for a service.

In the message text:

#### username

A username specified in the configuration file.

#### errdesc

Error description associated with the errno returned from getpwnam().

#### reason\_code

The reason code returned from *getpwnam()*.

## System action

inetd continues processing, but abandons the current request.

## System programmer response

Verify that the username shown is correctly set up in your security product.

#### **FOMN0017**

## pid execl program

## **Explanation**

This message is issued only if inetd is started with the debug (-d) option. inetd has forked a child to process a request and is about to exec the program associated with the requested service.

In the message text:

#### pid

The process id of the process. This is a child of inetd.

## program

The program about to be executed.

## **System action**

inetd issues the exec. This is the last debug message associated with processing a request.

## System programmer response

None.

#### **FOMN0019**

## execv server: errdesc, rsn=reason\_code

# **Explanation**

The *execv()* of the server programs associated with a request has failed.

In the message text:

#### server

Pathname of server program being executed.

#### errdesc

Error description associated with the errno returned from execv().

## reason\_code

The reason code returned from execv().

# **System action**

inetd will abandon the request.

## System programmer response

Ensure that the server program exists. If the name is wrong, correct the appropriate entry in the inetd configuration file.

## **FOMN0020**

#### pid reaped, status=status

# **Explanation**

This message is issued only if inetd is started with the debug (-d) option. A server, previously started by inetd, has ended and inetd has been notified by a SIGCHLD. inetd has issued a waitpid() to obtain the status.

In the message text:

#### pid

The process id of the server which has ended.

#### status

The status returned from waitpid().

## **System action**

inetd processing continues. Normal ending status is 100.

## System programmer response

None.

**FOMN0021** 

## service: exit status=status

## **Explanation**

A server, with the "wait" option in the inet configuration file, has ended and waitpid() returned a status of status.

In the message text:

#### service

Status ending status returned from waitpid().

## **System action**

inetd continue processing continues.

## System programmer response

None.

# FOMN0023

## restored service, fd fd

## **Explanation**

This message is issued only if inetd is started with the debug (-d) option. A server, with the "wait" option in the inet configuration file, has ended and inetd is ready to for the next request for this service.

In this message text:

#### service

The name of a service specified in the configuration file.

## System action

inetd continue processing continues.

## System programmer response

None.

**FOMN0024** 

config\_file: errdesc, rsn=reason\_code

## **Explanation**

inetd could not open its configuration file.

In the message text:

## config\_file

Filename specified when inetd was invoked. The default is /etc/inetd.conf.

#### errdesc

Error description associated with the errno returned from fopen().

#### reason\_code

The reason code returned to fopen().

# **System action**

inetd terminates.

## System programmer response

Ensure that config\_file exists or specify the correct pathname.

**FOMN0026** 

service/protocol: unknown service.

## **Explanation**

The service was requested in the inetd configuration file with the protocol shown, getservbyname() returned an error.

In the message text:

#### service

A service specified in the inetd configuration file.

#### protocol

The protocol specified for the service in the inetd configuration file.

#### errdesc

Error description associated with the errno returned to getservbyname().

#### reason code

The reason code returned to getservbyname().

## **System action**

inetd continues processing, but without the service/protocol shown.

## System programmer response

Correct the inetd configuration file entry for the *service/protocol* shown, or add the *service* shown with the *protocol* shown to /etc/services or TCP/IP's services data set.

**FOMN0027** 

service/protocol: socket: errdesc, rsn=reason\_code

## **Explanation**

The socket() failed for the service/protocol shown.

In the message text:

#### service

A service specified in the inetd configuration file.

#### protocol

The protocol specified for the service in the inetd configuration file.

#### errdesc

Error description associated with the errno returned from socket().

#### reason\_code

The reason code returned from socket().

## System action

inetd continues processing, but without the *service/protocol* shown. If the *errdesc* shown is for errno EAGAIN, *inetd* will assume that TCP/IP is not started and will retry the *socket()* call again in three minutes.

## System programmer response

If the errdesc is associated with EAGAIN, start TCP/IP. Otherwise contact IBM support.

## **FOMN0028**

service/protocol: setsockopt (SO\_DEBUG): errdesc, rsn=reason\_code

## **Explanation**

The setsockopt() with the SO\_DEBUG option, failed for the service/protocol shown. Note: SO\_DEBUG is set only if the debug (-d) option was specified when invoking inetd.

In the message text:

#### service

A service specified in the inetd configuration file.

#### protocol

The protocol specified for the service in the inetd configuration file.

#### errdesc

Error description associated with the errno returned to setsockopt().

#### reason\_code

The reason code returned from *setsockopt()*.

## **System action**

inetd continues processing.

## System programmer response

Contact IBM support.

**FOMN0029** 

service/protocol: setsockopt (SO\_REUSEADDR): errdesc , rsn=reαson\_code

## **Explanation**

The setsockopt() with the SO REUSEADDR option, failed for the service/protocol shown.

In the message text:

#### service

A service specified in the inetd configuration file.

## protocol

The protocol specified for the service in the inetd configuration file.

56 z/OS: z/OS UNIX System Services Messages and Codes

#### errdesc

Error description associated with the errno returned from setsockopt().

#### reason code

The reason code returned to setsockopt().

## System action

inetd continues processing.

## System programmer response

Contact IBM support.

#### **FOMN0030**

service/protocol: bind: errdesc, rsn=reason\_code

# **Explanation**

The bind() failed for the service/protocol shown.

In the message text:

#### service

A service specified in the inetd configuration file.

#### protocol

The protocol specified for the service in the inetd configuration file.

#### errdesc

Error description associated with the errno returned from bind().

#### reason\_code

The reason code returned to bind().

# System action

inetd continues processing. Unless the errno associated with *errdesc* is EADDRINUSE or EACCES, an attempt will be made in three minutes to initialize the socket.

## System programmer response

If the *return\_code* is EACCES or EADDRINUSE, the port is probably in use by or reserved for another application. In particular, by default, both telnet and 3270 telnet use the same port. It may be necessary to select an alternate port in /etc/services.

#### **FOMN0037**

Out of memory

## **Explanation**

While processing the inetd configuration file, memory could not be obtained.

# System action

inetd terminates.

## System programmer response

Increase memory available and restart inetd.

#### **FOMN0041**

internal service service unknown

An entry in the inetd configuration file specified "internal" for the server program name, but *service* is not a supported internal service.

In the message text:

#### service

The service in the configuration file which is incorrect.

## **System action**

inetd continues, but does not support service.

## System programmer response

Correct the service name or supply a valid program name.

**FOMN0042** 

strdup: errdesc

## **Explanation**

While processing inetd configuration file entries, inetd got an error return from a strdup() function call.

In the message text:

#### errdesc

Error description associated with the errno returned from strdup().

## **System action**

inetd continues, but will not support all services in the inetd configuration file.

# System programmer response

If errdesc is associated with ENOMEM, increase memory available and restart inetd.

**FOMN0043** 

Unable to open pidfile: errdesc, rsn=reason\_code

## **Explanation**

During initialization, inetd was not able to open its lock file.

In the message text:

## pidfile

The name of the inetd lock file, normally /etc/inetd.pid.

#### errdesc

Error description associated with the errno returned from open().

#### reason\_code

The reason code returned to open().

## **System action**

inetd terminates.

## System programmer response

Correct the condition preventing the open of the file and restart inetd.

**FOMN0044** 

Unable to lock pidfile: errdesc, rsn=reason\_code

During initialization, inetd was not able to lock its lock file.

In the message text:

### pidfile

The name of the inetd lock file, normally /etc/inetd.pid.

#### errdesc

Error description associated with the errno returned from fcntl().

### reason\_code

The reason code returned to fcntl().

# **System action**

inetd terminates.

# System programmer response

If *return\_code* is associated with EAGAIN, inetd is already active. Stop the other inetd if first if you wish to restart it. For other errors, contact IBM service.

### **FOMN0048**

# bump\_nofile: cannot extend file limit

# **Explanation**

The maximum number of file/socket descriptors has been exceeded.

# **System action**

inetd continues, but will not support all requested services.

# **System programmer response**

Increase the number of file descriptors allowed per process.

### **FOMN0049**

Unable to get time of day

## **Explanation**

The time built-in service was unable to get the system time.

# **System action**

A time of binary zeros is returned to the client.

## System programmer response

Contact IBM support.

### **FOMN0051**

action: service proto=protocol, wait.max=wait.max , user.group=user.group builtin=builtin server= server

## **Explanation**

This message is issued only if inetd is started with the debug (-d) option. It is issued during initialization and whenever the sockets are reinitialized. If *action* is "ADD", the *service* is being added to the list of supported services; if "FREE", the service is being dropped; if "REDO", the service is being reinitialized.

In the message text:

### **FOMN** messages

#### action

"ADD", "REDO" or "FREE".

#### service

The name of a service specified in the configuration file.

### protocol

The protocol specified for the service in the inetd configuration file.

#### wait

Zero if "nowait" is specified on the configuration file entry for service.

#### max

The maximum number of requests for *service* per 60 second interval before inetd considers it to be a flood of requests.

#### IISP

The username server is to run under.

#### group

The groupname server is to run under. If "(none)", inetd does not set the groupname.

#### built-in

Zero if the service is not handled directly by inetd.

#### server

Pathname of server program to be executed for the service.

# **System action**

inetd continues initialization or re-initialization.

# System programmer response

None.

### **FOMN0061**

### service/protocol server failing (looping), service terminated

## **Explanation**

The number of requests for the specified *service/protocol* during the last 60 seconds exceeded the maximum specified in the inetd configuration file.

In the message text:

### service

The name of the service specified in the configuration file.

### protocol

The protocol specified for the service in the inetd configuration file.

# **System action**

The service is stopped. It will be reinitialized in three minutes.

### System programmer response

None.

#### **FOMN0062**

### setsid: errdesc, rsn=reason\_code

# **Explanation**

During initialization, inetd issued a *setsid()* to create a new session that is separate from the invoking process. The *setsid()* failed.

In the message text:

#### errdesc

Error description associated with the errno returned from setsid()

### reason\_code

The reason code returned from setsid().

# System action

inetd terminates.

# System programmer response

Contact IBM support.

### **FOMN0063**

#### about to issue select numsock

# **Explanation**

This message is issued only if inetd is started with the debug (-d) option. inetd is about to issue a *select()* on the sockets for the services specified in the inetd configuration file. There is one socket for each service specified in the inetd configuration file.

In the message text:

#### numsock

The number of socks inetd is about to select on.

# **System action**

inetd issues the *select()*. inetd will wait until someone requests one of the services, a signal is received, or an error occurs.

### System programmer response

None.

### **FOMN0064**

select returned select rv

# **Explanation**

This message is issued only if inetd is started with the debug (-d) option. *inetd's select()* has ended, returning *select\_rv*. Normally, the return value will be either one, indicating that a request has arrived from a client, or -1 indicating an error - generally EINTR.

## select\_rv

The return value returned to the inetd select() on sockets.

# **System action**

If a request has arrived, inetd processes the request. If the return value is -1, message FOMN0065 is issued.

### System programmer response

None.

**FOMN0065** 

select: errdesc. rsn=reason code.

This message is issued only if inetd is started with the debug (-d) option and the return value to select() is -1. The most common return\_code is EINTR, indicating that a signal has been received. Generally, this is from a SIGCHLD when a child process terminates. When that occurs, message FOMN0020 will have been issued.

# **System action**

If an EINTR has been received, inetd re-issues the *select()*. For other errnos, message FOMN0008 and possibly FOMN0009 are issued.

# System programmer response

If FOMN0008 or FOMN0009 is issued, see the response for those messages.

### **FOMN0066**

### pgmname terminating

# **Explanation**

inetd is about to terminate.

In the message text:

### pgmname

inetd's program name (inetd).

# System action

inetd terminates.

# System programmer response

If this is an unexpected termination, use other messages to determine the cause. Contact IBM support, if needed.

#### **FOMN0067**

### service/protocol: can't set gid gid: errdesc , rsn=reason\_code

# **Explanation**

This message should not occur because the groupid being set was just obtained from a getpwnam().

In the message text:

#### service

A service specified in the inetd configuration file.

#### protocol

The protocol specified for the service in the inetd configuration file.

#### gid

The groupid being set.

#### errdesc

Error description associated with the errno returned from setgid().

# reason\_code

The reason code returned from *setgid()*.

### **System action**

inetd terminates the current request, but continues process subsequent requests.

Contact IBM support.

#### **FOMN0068**

service/protocol: can't set uid uid: errdesc, rsn=reason\_code

# **Explanation**

In the message text:

#### service

A service specified in the inetd configuration file.

### protocol

The protocol specified for the service in the inetd configuration file.

#### uid

The userid being set.

#### errdesc

Error description associated with the errno returned from setuid().

### reason\_code

The reason code returned from *setuid()*.

# **System action**

inetd terminates the current request, but continues process subsequent requests.

# System programmer response

Contact IBM support.

### **FOMN0069**

service/protocol: setibmsockopt (SO\_EioIfNewTP):errdesc, rsn=reason\_code

# **Explanation**

The setibmsockopt() to request notification if a TCP/IP stack starts (when running with common inet) or stops (when running without common inet, or when the last stack ends with common inet) did not succeed.

In the message text:

#### service

A service specified in the inetd configuration file.

#### protocol

The protocol specified for the service in the inetd configuration file.

#### errdesc

Error description associated with the errno returned from *setibmsockopt()*.

#### reason code

The reason code returned from *setibmsockopt()*.

### **System action**

inetd continues, but may not close and restart sockets when TCP/IP stacks are started or recycled.

## System programmer response

Contact IBM support.

### **FOMN0070**

config: syntax error

An entry in the configuration file is incomplete. Information has to be provided for all fields in a configuration file entry. For more information, see <u>inetd daemon - Provide service management for networks</u> in *z/OS UNIX System Services Command Reference*.

In the message text:

## config

The name of the configuration file, inetd.conf by default.

# **System action**

Initialization exits.

# System programmer response

Edit the configuration file and provide the information for missing fields.

### **FOMN0071**

service: malformed buffer size option 'text'

# **Explanation**

The syntax for a send or receive buffer size is incorrect. It must be a decimal number, optionally followed by a 'k' for kilobytes or 'm' for megabytes.

In the message text:

### service

A service specified in the inetd configuration file.

#### text

The value specified on sndbuf= or rcvbuf=.

## **System action**

Initialization continues with other services specified in the configuration file.

## System programmer response

Edit the configuration file and provide a syntactically correct buffer size.

## **FOMN0072**

service: invalid buffer size 'text'

### **Explanation**

A negative buffer size was provided.

In the message text:

#### service

A service specified in the inetd configuration file.

### text

The value specified on sndbuf= or rcvbuf=.

# **System action**

Initialization continues with other services specified in the configuration file.

### System programmer response

Edit the configuration file and provide a positive buffer size.

#### **FOMN0073**

service: too many buffer sizes

# **Explanation**

More than two buffer sizes were provide for the service.

In the message text:

#### service

A service specified in the inetd configuration file.

# **System action**

Initialization continues with other services specified in the configuration file.

# System programmer response

Edit the configuration file and remove the redundant sndbuf or rcvbuf.

#### **FOMN0074**

service: invalid protocol specified

# **Explanation**

An invalid protocol was specified in a configuration file entry for service service.

In the message text:

### service

A service specified in the inetd configuration file.

# **System action**

Initialization continues with other services specified in the configuration file.

### System programmer response

Edit the configuration file and correct the protocol.

### **FOMN0076**

action: localaddr: service: proto= protocol, sndbuf=sndbuf, rcvbuf=rcvbuf, wait.max= wait.max, user.group=user.group builtin=builtin server= server

## **Explanation**

This message is issued only if inetd is started with the debug (-d) option. It is issued during initialization and whenever the sockets are reinitialized. If *action* is "ADD", the *service* is being added to the list of supported services; if "FREE", the service is being dropped; if "REDO", the service is being reinitialized.

In the message text:

#### action

"ADD", "REDO" or "FREE".

#### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

#### service

The name of a service specified in the configuration file.

### protocol

The protocol specified for the service in the inetd configuration file.

# sndbuf

The size of the send buffer specified in the configuration file. Zero if not specified.

### **FOMN** messages

#### rcvbuf

The size of the receive buffer specified in the configuration file. Zero if not specified.

#### wait

Zero if "nowait" is specified on the configuration file entry for service.

#### max

The maximum number of requests for *service* per 60 second interval before inetd considers it to be a flood of requests.

#### user

The username server is to run under.

#### group

The groupname server is to run under. If "(none)", inetd does not set the groupname.

#### built-in

Zero if the service is not handled directly by inetd.

#### server

Pathname of server program to be executed for the service.

# System action

inetd continues initialization or re-initialization.

### System programmer response

None.

## **FOMN0077**

*localaddr*: service/protocol: the address family is not supported by the kernel

# **Explanation**

The protocol chosen resulted in an address family that is not supported.

In the message text:

### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

### service

The name of a service specified in the configuration file.

### protocol

The protocol specified for the service in the inetd configuration file.

# System action

Initialization continues with other services specified in the configuration file.

## System programmer response

This can be the result of choosing a protocol of tcp6 or udp6 without kernel support for AF\_UNIX6. Check the kernel initialization parameters, BPXPRMxx.

## **FOMN0078**

someone wants service on localaddr

# **Explanation**

This message is issued only if inetd is started with the debug (-d) option. A request has arrived on the port associated with *service* and the local IP address *localaddr*.

In the message text:

66 z/OS: z/OS UNIX System Services Messages and Codes

#### service

The name of a service specified in the configuration file.

#### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

# System action

inetd will process that request, ultimately invoking the program specified for the service in the configuration file.

## System programmer response

None.

**FOMN0079** 

pid execv program

# **Explanation**

This message is issued only if inetd is started with the debug (-d) option. inetd has forked a child to process a request and is about to exec the program associated with the requested service.

In the message text:

### pid

The process id of the process. This is a child of inetd.

### program

The program about to be executed.

# **System action**

inetd issues the exec. This is the last debug message associated with processing a request.

# System programmer response

None.

**FOMN0080** 

localaddr: service/protocol: getaddrinfo errdesc

### **Explanation**

A getaddrinfo() issued by inetd initialization or restart processing failed. This can happen if *localaddr* is not a valid IP address, if TCP/IP or the resolver is not started or if *service/protocol* is not defined in /etc/services or the TCP/IP services dataset.

In the message text:

### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

#### service

The name of a service specified in the configuration file.

### protocol

The protocol specified for the service in the inetd configuration file.

#### errdesc

Error description associated with the return value returned from *getaddrinfo()*.

# **System action**

inetd continues with the next configuration file entry. It will retry those that fail every three minutes.

Start TCP/IP and the resolver, if necessary, and check and correct the inetd configuration file, /etc/services file and/or the TCP/IP services data set. If the inetd configuration file is changed, it will be necessary to either stop and restart inetd, or send it a SIGHUP signal to pick up the changes.

**FOMN0081** 

localaddr: service/protocol: getaddrinfo resolved to multiple addresses

# **Explanation**

A getaddrinfo() issued by inetd initialization or restart processing returned more than one IP address. This will happen only if *localaddr* is a name, not an IP address, and that name has more than one IP address associated with it. For instance, if *localaddr* were somesite.ibm.com, and that resolved to three IP addresses.

In the message text:

### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

#### service

The name of a service specified in the configuration file.

### protocol

The protocol specified for the service in the inetd configuration file.

# **System action**

inetd continues with the next configuration file entry. It will retry those that fail every three minutes.

# System programmer response

Change the entry in the inetd configuration file, providing either an IP address or a name that resolves to a single IP address. Then either stop and restart inetd or send it a SIGHUP signal to pick up the changes. inetd will not reread the configuration file unless the SIGHUP is sent.

**FOMN0082** 

localaddr: service/protocol: setibmsockopt (SO\_EioIfNewTP):errdesc, rsn=reason\_code

# **Explanation**

The setibmsockopt() to request notification if a TCP/IP stack starts (when running with common inet) or stops (when running without common inet, or when the last stack ends with common inet) did not succeed.

In the message text:

### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

### service

A service specified in the inetd configuration file.

### protocol

The protocol specified for the service in the inetd configuration file.

#### errdesc

Error description associated with the errno returned from *setibmsockopt()*.

#### reason\_code

The reason code returned from *setibmsockopt()*.

### **System action**

inetd continues, but may not close and restart sockets when TCP/IP stacks are started or recycled.

Contact IBM support.

**FOMN0083** 

localaddr: service/protocol: setsockopt (SO\_DEBUG): errdesc, rsn=reason\_code

# **Explanation**

The setsockopt() with the SO\_DEBUG option, failed for the *localaddr* and *service/protocol* shown. Note: SO\_DEBUG is set only if the debug (-d) option was specified when invoking inetd.

In the message text:

#### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

#### service

A service specified in the inetd configuration file.

#### protocol

The protocol specified for the service in the inetd configuration file.

#### errdesc

Error description associated with the errno returned to *setsockopt()*.

### reason\_code

The reason code returned from *setsockopt()*.

# **System action**

inetd continues processing.

### System programmer response

Contact IBM support.

**FOMN0084** 

localaddr: service/protocol: setsockopt (SO\_REUSEADDR): errdesc, rsn=reason\_code

# **Explanation**

The setsockopt() with the SO\_REUSEADDR option, failed for the localaddr and service/protocol shown.

In the message text:

### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

#### service

A service specified in the inetd configuration file.

### protocol

The protocol specified for the service in the inetd configuration file.

### errdesc

Error description associated with the errno returned from setsockopt().

#### reason\_code

The reason code returned to *setsockopt()*.

# System action

inetd continues processing.

Contact IBM support.

**FOMN0085** 

localaddr: service/protocol: setsockopt (SO\_SNDBUF n): errdesc,
rsn=reason\_code

# **Explanation**

The setsockopt() with the SO\_SNDBUF option, failed for the localaddr and service/protocol shown.

In the message text:

#### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

#### service

A service specified in the inetd configuration file.

### protocol

The protocol specified for the service in the inetd configuration file.

n

The send buffer size requested in the inetd configuration file.

#### errdesc

Error description associated with the errno returned from *setsockopt()*.

### reason\_code

The reason code returned to setsockopt().

# **System action**

inetd continues processing with either a smaller buffer or the default.

### System programmer response

If the *errdesc* corresponds to an errno of ENOBUFS, reduce the requested buffer size or consult TCP/IP documentation on how to provide more space. Otherwise, contact IBM support.

**FOMN0086** 

localaddr: service/protocol: setsockopt (SO\_RCVBUF n): errdesc, rsn=reason\_code

### **Explanation**

The setsockopt() with the SO\_RCVBUF option, failed for the localaddr and service/protocol shown.

In the message text:

### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

### service

A service specified in the inetd configuration file.

### protocol

The protocol specified for the service in the inetd configuration file.

n

The send buffer size requested in the inetd configuration file.

### errdesc

Error description associated with the errno returned from *setsockopt()*.

### reason\_code

The reason code returned to *setsockopt()*.

70 z/OS: z/OS UNIX System Services Messages and Codes

# **System action**

inetd continues processing with either a smaller buffer or the default.

# System programmer response

If the *errdesc* corresponds to an errno of ENOBUFS, reduce the requested buffer size or consult TCP/IP documentation on how to provide more space. Otherwise, contact IBM support.

**FOMN0087** 

localaddr: service/protocol server failing (looping), service terminated

# **Explanation**

The number of requests for the specified *localaddr* and *service/protocol* during the last 60 seconds exceeded the maximum specified in the inetd configuration file.

In the message text:

### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

#### service

The name of the service specified in the configuration file.

### protocol

The protocol specified for the service in the inetd configuration file.

# **System action**

The service is stopped. It will be reinitialized in three minutes.

# System programmer response

None.

**FOMN0088** 

localaddr: service/protocol: can't set gid gid: errdesc, rsn=reason\_code

## **Explanation**

This message should not occur because the groupid being set was just obtained from a getpwnam().

In the message text:

### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

#### service

A service specified in the inetd configuration file.

#### protocol

The protocol specified for the service in the inetd configuration file.

### gid

The groupid being set.

#### errdesc

Error description associated with the errno returned from setgid().

### reason\_code

The reason code returned from setgid().

# **System action**

inetd terminates the current request, but continues process subsequent requests.

Contact IBM support.

**FOMN0089** 

localaddr: service/protocol: can't set uid uid: errdesc, rsn=reason\_code

# **Explanation**

This message should not occur because the userid being set was just obtained from a getpwnam().

In the message text:

#### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

### service

A service specified in the inetd configuration file.

#### protocol

The protocol specified for the service in the inetd configuration file.

#### uid

The userid being set.

#### errdesc

Error description associated with the errno returned from setuid().

### reason\_code

The reason code returned from *setuid()*.

# **System action**

inetd terminates the current request, but continues to process subsequent requests.

### System programmer response

Contact IBM support.

**FOMN0090** 

localaddr: service/protocol: socket: errdesc, rsn=reason\_code

## **Explanation**

The socket() failed for the localaddr and service/protocol shown.

In the message text:

#### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

#### service

A service specified in the inetd configuration file.

#### protocol

The protocol specified for the service in the inetd configuration file.

#### errdesc

Error description associated with the errno returned from *socket()*.

### reason\_code

The reason code returned from *socket()*.

# **System action**

inetd continues processing, but without the service/protocol shown. If the errdesc shown is for errno EAGAIN, inetd will assume that TCP/IP is not started and will retry the socket() call again in three minutes.

If the errdesc is associated with EAGAIN, start TCP/IP. Otherwise contact IBM support.

**FOMN0091** 

localaddr: service/protocol: bind: errdesc, rsn=reason\_code

## **Explanation**

The bind() failed for the localaddr and service/protocol shown.

In the message text:

#### localaddr

The local IP address specified in the configuration file. An asterisk indicates INADDR\_ANY (an "\*" in the configuration file) was requested or defaulted.

### service

A service specified in the inetd configuration file.

#### protocol

The protocol specified for the service in the inetd configuration file.

#### errdesc

Error description associated with the errno returned from bind().

### reason\_code

The reason code returned to bind().

# System action

inetd continues processing. Unless the errno associated with *errdesc* is EADDRINUSE or EACCES, an attempt will be made in three minutes to initialize the socket.

# System programmer response

If the *return\_code* is EACCES or EADDRINUSE, the port is probably in use by or reserved for another application. In particular, by default, both telnet and 3270 telnet use the same port. It may be necessary to select an alternate port in /etc/services.

### **FOMR**

### **FOMR0201**

### Only one of -k and -v allowed

## **Explanation**

rlogind was invoked with invalid options. Only one of Kerberos (-k) or Vacuous (-v) options are allowed.

# System action

rlogin request terminates.

### System programmer response

Invoke rlogind with the correct syntax. See z/OS UNIX System Services Command Reference.

### **FOMR0202**

### Can't get peer name of remote host: errdesc

# **Explanation**

getpeername() call failed.

### errdesc

Error description associated with the errno returned from getpeername().

# **System action**

rlogin request terminates.

# System programmer response

Consult TCP/IP documentation and <u>z/OS C/C++ Runtime Library Reference</u>. Determine why getpeername() call failed.

### **FOMR0203**

### Can't get peer name of remote host:

# **Explanation**

getpeername() call failed.

#### errdesc

Error description associated with the errno returned from getpeername().

#### reason\_code

The reason code returned from getpeername().

# **System action**

rlogin request terminates.

# System programmer response

Consult TCP/IP documentation and z/OS C/C++ Runtime Library Reference. Determine why getpeername() call failed.

### **FOMR0204**

### Setsockopt (SO\_KEEPALIVE): errdesc

# **Explanation**

The Setsockopt() with the SO\_KEEPALIVE option failed.

### errdesc

Error description associated with the errno returned from setsockopt().

# **System action**

rlogin session continues.

### **System programmer response**

Consult TCP/IP documentation and z/OS C/C++ Runtime Library Reference. Determine why setsockopt() call failed.

### **FOMR0206**

#### Secondary port number error

# **Explanation**

The secondary port number sent by the rlogin client using rcmd() call is in error. rlogind expects 0 (null byte) as the secondary port number, if it does not receive the null byte within 60 seconds from the rlogin client, it assumes something went wrong.

### **System action**

rlogin request terminates.

Contact IBM support.

#### **FOMR0207**

### Remote host requires Kerberos authentication

# **Explanation**

Remote host requires Kerberos authentication, but the Vacuous (-v) option is specified.

# **System action**

rlogin request terminates.

## System programmer response

Verify that remote host is Kerberos authenticated.

### **FOMR0209**

### Connection from address on illegal port

# **Explanation**

Connection from the specified IP address is not bound to a reserved port.

#### address

Numerical IP address of the host.

# System action

rlogin request terminates.

# System programmer response

Verify that the client at the specified address is bound to a reserved port.

#### **FOMR0210**

#### Permission denied

# **Explanation**

Permission for connection from specified IP address and port is denied.

# **System action**

rlogin request terminates.

## System programmer response

Verify that client at the specified address is bound to a reserved port.

### **FOMR0211**

# Connection received using IP options (ignored): options

## **Explanation**

getsockopt() call was successful. The internet protocol options are:

### options

IP options string.

# **System action**

rlogin session continues.

This is an informational message only.

#### **FOMR0212**

### Setsockopt IP\_OPTIONS NULL: errdesc

## **Explanation**

Explanation: setsockopt() call with IP\_OPTIONS failed.

### errdesc

Error description associated with the errno returned from setsockopt().

# System programmer response

Consult TCP/IP documentation and  $\underline{z/OS\ C/C++\ Runtime\ Library\ Reference}$ . Determine why setsockopt() call failed.

### **User response**

rlogin request terminates.

### **FOMR0213**

Host address mismatch.

## **Explanation**

Login failed. The user is not authenticated.

# System action

rlogin request terminates.

# **User response**

Verify that user name and password are correct.

### **FOMR0214**

### Setgid error errdesc rsn=reason\_code

### **Explanation**

setgid() call failed to set the required group ID.

#### errdesc

Error description associated with the errno returned from setgid().

### reason code

The reason code returned from setgid().

# System action

rlogin request terminates.

### System programmer response

For more information on the error description and reason code values displayed in this message, see <u>z/OS UNIX</u> System Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

### **FOMR0215**

### Initgroups error errdesc rsn=reason\_code

## **Explanation**

Initgroups() call failed.

76 z/OS: z/OS UNIX System Services Messages and Codes

#### errdesc

Error description associated with the errno returned from initgroups().

#### reason code

The reason code returned from initgroups().

## System action

rlogin request terminates.

# System programmer response

For more information on the error description and reason code values displayed in this message, see <u>z/OS UNIX</u> System Services Programming: Assembler Callable Services Reference z/OS UNIX System Services Programming: Assembler Callable Services Reference-> and <u>z/OS C/C++ Runtime Library Reference</u>.

### **FOMR0216**

### Setuid error errdesc rsn=reason\_code

# **Explanation**

setuid() call failed to set the required user ID.

#### errdesc

Error description associated with the errno returned from setuid().

### reason code

The reason code returned from setuid().

# **System action**

rlogin request terminates.

# System programmer response

For more information on the error description and reason code values displayed in this message, see <u>z/OS UNIX</u> <u>System Services Programming: Assembler Callable Services Reference</u> z/OS UNIX System Services Programming: Assembler Callable Services Reference-> and z/OS C/C++ Runtime Library Reference.

### **FOMR0217**

## Execlp to rlogind2 error errdesc rsn=reason\_code

### **Explanation**

Exec function Ffailed to execute rlogind2.

### errdesc

Error description associated with the errno returned from execlp().

### reason\_code

The reason code returned from execlp().

### **System action**

rlogin request terminates.

## System programmer response

For more information on the error description and reason code values displayed in this message, see z/OS C/C++ Runtime Library Reference.

**FOMR0218** 

Rlogind: message\_string: errdesc rsn= reason\_code

### **FOMR** messages

## **Explanation**

This message line contains the actual message string for rlogin daemon messages.

### message\_string

actual rlogin daemon message with error description and reason code.

# System programmer response

Refer to the actual message.

### User response

Look up the actual message and take appropriate action as described.

**FOMR0219** 

Rlogind: message\_string

# **Explanation**

This message line contains the actual message string for rlogin daemon messages. message\_string actual rlogin daemon message.

# System programmer response

Refer to the actual message.

# **User response**

Look up the actual message and take appropriate action as described.

**FOMR0220** 

Remuser too long

## **Explanation**

The length of the remote user name supplied was invalid.

# System action

rlogin request terminates.

### User response

Provide the correct length remote user name when logging in. Refer to local rlogin client documentation.

**FOMR0221** 

Locuser too long

## **Explanation**

The length of the local user name supplied was invalid.

# **System action**

rlogin request terminates.

### User response

Provide the correct length local user name when logging in. Refer to local rlogin client documentation.

FOMR0222

Terminal type too long

The length of the terminal type supplied was invalid.

# **System action**

rlogin request terminates.

# **User response**

Check the length of specified terminal type. Refer to local rlogin client documentation.

**FOMR0223** 

Usage: rlogind -adlmn -k | -v

# **Explanation**

This message shows the correct syntax for the rlogin daemon with Kerberos authentication defined. It is displayed when the syntax supplied is incorrect.

# **User response**

Reenter the rlogind command using correct syntax. For a description of the rlogind options, see z/OS UNIX System Services Command Reference.

**FOMR0224** 

Usage: rlogind -adlmn

# **Explanation**

This message shows the correct syntax for the rlogin daemon without Kerberos authentication defined. It is displayed when the syntax supplied is incorrect.

# User response

Reenter the rlogind command using correct syntax. For a description of the rlogind options, see z/OS UNIX System Services Command Reference.

**FOMR0225** 

Login:

## **Explanation**

You are being prompted for your login name.

## **User response**

Provide a login name to start the login process.

**FOMR0226** 

<username>'s Password:

### **Explanation**

You are being asked to supply a login password or password phrase.

### **User response**

Supply the correct password or password phrase. A password is at most 8 bytes long and a password phrase is 9-100 bytes long. Any character string greater than 100 or zero in length is invalid. Check with your installation security product for additional restrictions.

**FOMR0227** 

Caller is not a member of BPX.DAEMON facility

The password verification routine failed. The user ID of the rlogin daemon invoker is not defined in the BPX.DAEMON facility.

# System action

rlogin session continues.

# System programmer response

Insufficient authorization of the rlogin daemon: The rlogin daemon uses the \_passwd() call to authenticate the remote user. Programs that call \_passwd() in a z/OS UNIX environment that is secured with BPX.DAEMON must be defined as program controlled to the security manager. Have your system administrator set the program controlled extended attribute for the rlogin daemon.

### **FOMR0228**

You entered an invalid login name or password

# **Explanation**

The login name or password or password phrase you supplied was invalid. You will be prompted again for the login name.

# **User response**

Provide the correct name and password or password phrase. The terminal session will be closed after three invalid attempts.

**FOMR0229** 

**Password expired** 

# **Explanation**

Your password or password phrase has expired.

### **User response**

You will be prompted to change it.

# FOMR0230

**Enter new password:** 

# **Explanation**

You are being prompted to enter a new password or password phrase because your old one expired.

### **User response**

Enter new, valid password or password phrase.

### **FOMR0231**

Re-enter new password:

### **Explanation**

You are changing your password or password phrase, and must reenter the new one for verification.

### **User response**

Reenter the password or password phrase.

### **FOMR0232**

You entered an invalid password

While changing your password or password phrase, you entered a new one that was not valid.

# **User response**

Use a password or password phrase that is valid according to your site's requirements.

### **FOMR0233**

New passwords do not match

# **Explanation**

While changing your password or password phrase, the first and second new password or password phrase entries did not match.

# **User response**

You will be prompted to change the password or password phrase again. You have up to three attempts.

### FOMR0234

Password too long

## **Explanation**

While changing your password or password phrase, you entered a new one that had more than 255 bytes.

# **User response**

You will be prompted to enter a new password or password phrase again. You have up to three attempts. Use a password or password phrase that is valid according to your site's requirements.

FOMR0235 Read error: errdesc

## **Explanation**

The read request for the banner file failed.

#### errdesc

Error description associated with the errno returned from read().

# System action

rlogin session continues.

## **System programmer response**

Determine the cause of read failure based on error description. Consult z/OS C/C++ Runtime Library Reference.

FOMR0236 Open error: errdesc

## **Explanation**

The open request for the banner file failed.

#### errdesc

Error description associated with the errno returned from open().

### **System action**

rlogin session continues.

Make sure that /etc/banner file exists and has the correct access permissions. Consult z/OS C/C++ Runtime Library Reference.

**FOMR0237** 

**Malloc error** 

# **Explanation**

The malloc() call failed and storage was not obtained.

# System action

rlogin session continues.

# System programmer response

Consult z/OS C/C++ Runtime Library Referenceand determine why malloc() call failed.

**FOMR0238** 

Password error, errdesc, reason code

# **Explanation**

This warning message is issued to syslog only if rlogind is started with the debug (-d) option. This message indicates that there was an error during password or password phrase authentication (\_\_passwd() call).

#### errdesc

Error description associated with the errno returned from \_\_passwd().

### reason\_code

The reason code returned from \_\_passwd().

# System action

rlogin session continues.

### System programmer response

z/OS C/C++ Runtime Library Reference.

### **User response**

Check the error description and reason code to identify the error.

**FOMR0302** 

usage: rlogind2 -kxadm

# **Explanation**

This message shows the correct syntax for second part of the rlogin daemon. It is displayed when the syntax is incorrect.

k

Specifies that the Kerberos authentication support be enabled.

X

Specifies that the Encrypt support be enabled.

а

Specifies that the requester's Internet address be checked against the local gethostbyname() file. This option has no effect because the rlogin daemon never uses the .rhosts file for authentication.

d

Specifies that the debug option be enabled.

m

Specifies that the multiprocess support in the user address space be enabled.

# **User response**

Reenter the rlogind2 command using the correct syntax.

### **FOMR0303**

user name not specified

# **Explanation**

User name was not passed as argument to second part of the rlogin daemon.

# System action

rlogind2 terminates.

# System programmer response

The z/OS UNIX version of the rlogin daemon passes the terminal type as its first argument, and the user name as the second argument. Make sure a user name is specified.

### **FOMR0304**

term not specified

# **Explanation**

Terminal type was not passed as argument to second part of the rlogin daemon.

# System action

rlogind2 terminates.

# **System programmer response**

The z/OS UNIX version of the rlogin daemon passes the terminal type as its first argument, and the user name as the second argument. Make sure a terminal type is specified.

### **FOMR0307**

ROOT Kerberos login from %s.%s@%s on %s

### **Explanation**

This is a Root Kerberos login authentication information message issued to syslog.

### **System action**

rlogind2 continues processing.

### System programmer response

None.

**FOMR0309** 

select mask too small, increase FD\_SETSIZE

## **Explanation**

Number of open file descriptors is more than the defined FD\_SETSIZE. This error message is issued to syslog.

# **System action**

rlogind2 terminates.

Check the FD\_SETSIZE and increase it accordingly. For more information, consult z/OS C/C++ Runtime Library Reference.

### **FOMR0310**

internal error (select mask too small)

# **Explanation**

Number of open file descriptors is more than the defined FD\_SETSIZE.

# System action

rlogind2 terminates.

# System programmer response

Check the FD\_SETSIZE and increase it accordingly. For more information, consult <u>z/OS C/C++ Runtime Library</u> Reference.

### **FOMR0311**

select errdesc rsn=reason\_code

### **Explanation**

Select() call failed.

#### errdesc

Error description associated with the errno returned from select().

#### reason code

The reason code returned from select().

# System action

rlogind2 terminates.

# System programmer response

Investigate why the select() request failed based on error description and reason code. For more information, consult *z/OS C/C++ Runtime Library Reference*.

### **FOMR0312**

EOF on socket

## **Explanation**

Read() call on a socket returned an error or zero value indicating EOF. This message is issued to syslog only if rlogind2 is started with the debug (-d) option.

## System action

rlogind2 continues processing.

### **FOMR0313**

**EOF** on manager tty

### **Explanation**

Readv() call on a manager tty returned an error or zero value indicating EOF. This message is issued to syslog only if rlogind2 is started with the debug (-d) option.

# **System action**

rlogind2 continues processing.

#### **FOMR0314**

child waitpid failed

## **Explanation**

The waitpid() request by parent process to wait for the child process to terminate and save the exit status failed.

# **System action**

rlogind2 continues processing.

## System programmer response

Investigate why the waitpid() request failed. For more information, consult z/OS C/C++ Runtime Library Reference.

**FOMR0315** 

child exit status=status

## **Explanation**

The exit status of the child process. This informational message is issued to syslog only if rlogind2 is started with the debug (-d) option.

# System action

rlogind2 continues processing.

# System programmer response

None.

**FOMR0316** 

Fork utmp error errdesc rsn=reason\_code

### **Explanation**

Fork() call failed to create a new process to close the utmp file entry.

### errdesc

Error description associated with the errno returned from fork().

### reason\_code

The reason code returned from fork().

# **System action**

rlogind2 terminates.

### System programmer response

Investigate why the fork() request failed. For more information, consult z/OS C/C++ Runtime Library Reference.

# **User response**

**FOMR0317** 

execl FSUMOCLO error

### **FOMR** messages

# **Explanation**

Execl() function failed to execute FSUMOCLO to close the utmp file entry.

# **System action**

rlogind2 terminates.

# System programmer response

Contact IBM support.

**FOMR0318** 

waitpid failed, status=status

# **Explanation**

The waitpid() request by parent process to wait for the child process to update and close the utmp file entry failed

# **System action**

rlogind2 continues processing.

# **System programmer response**

Investigate why the waitpid() request failed. For more information, consult z/OS C/C++ Runtime Library Reference.

**FOMR0319** 

utmp error = status

# **Explanation**

There was an error in utmp file update and close processing. The process returned with non-zero value status.

# **System action**

rlogind2 continues processing.

# System programmer response

Check the returned status and investigate the error. For more information on the status value, consult z/OS C/C++ Runtime Library Reference.

## **User response**

None.

**FOMR0320** 

Rlogind2: message\_string: errdesc rsn= reason\_code

## **Explanation**

This message line contains the actual message string for rlogind2 messages.

### message\_string

actual rlogind2 message with error description and reason code.

# System programmer response

Refer to the actual message.

# **User response**

Look up the actual message and take appropriate action as described.

**FOMR0321** 

Rlogind2: message\_string

# **Explanation**

This message line contains the actual message string for rlogind2 messages.

# message\_string

actual rlogind2 message.

# System programmer response

Refer to the actual message.

### **User response**

Look up the actual message and take appropriate action as described.

**FOMR0322** 

Out of ptys

# **Explanation**

Could not obtain a free pseudo-tty. Out of pseudo-ttys. All pseudo-ttys may be in use.

# **System action**

rlogind2 terminates.

# System programmer response

Make sure that this manager tty is defined correctly. The system looks for pseudo-ttys starting at /dev/ptyp0000 and continues looking for pseudo-ttys up through /dev/ptyp9999, in order. As soon as the system fails for one of these pseudo-ttys, it looks no further.

## **User response**

None.

**FOMR0323** 

open error on line errdesc rsn=reason\_code

# **Explanation**

Open() call failed to open a subsidiary pseudo-tty.

#### line

Pseudo-tty name.

#### errdesc

Error description associated with the errno returned from open().

### reason\_code

The reason code returned from open().

# System action

rlogind2 terminates.

Investigate why the open() request failed. For more information on open failure and error description, consult z/OS C/C++ Runtime Library Reference.

### FOMR0324

### Can not translate current code page

# **Explanation**

Could not initialize the translation tables from ISO8859-1 to EBCDIC code set name for current locale of the rlogin daemon.

# **System action**

rlogind2 terminates.

# System programmer response

Contact IBM support.

#### **FOMR0325**

### Packet mode control byte=n

# **Explanation**

This informational message is issued to syslog only if rlogin daemon is started with the debug (-d) option. This message indicates the control byte of the pty packet mode.

# **System action**

rlogind2 continues processing.

#### **FOMR0326**

## \_\_tcsetattr errdesc rsn=reason\_code

### **Explanation**

tcsetattr() call failed to set the extended attributes to manager tty.

### errdesc

Error description associated with the errno returned from tcsetattr().

### reason code

The reason code returned from tcsetattr().

# **System action**

rlogind2 terminates.

### System programmer response

Investigate why the tcsetattr() request failed. For more information, consult z/OS C/C++ Runtime Library Reference.

### **FOMR0327**

#### tcsetcp errdesc rsn=reason code

### **Explanation**

\_\_tcsetcp() call failed to set the terminal code page information for manager terminal tty.

### errdesc

Error description associated with the errno returned from \_\_tcsetcp().

### reason\_code

The reason code returned from \_\_tcsetcp().

# System action

rlogind2 terminates.

# System programmer response

Investigate why the  $\_$ tcsetcp() request failed. For more information, consult  $\underline{z/OS}$   $\underline{C/C++}$   $\underline{Reference}$ .

**FOMR0328** 

\_\_tcgetcp errdesc rsn=reason\_code

# **Explanation**

\_\_tcgetcp() call failed to get the terminal code page information for manager tty.

#### errdesc

Error description associated with the errno returned from \_\_tcgetcp().

### reason\_code

The reason code returned from \_\_tcgetcp()

# System action

rlogind2 terminates.

### System programmer response

Investigate why the  $\_$ tcgetcp() request failed. For more information, consult  $\underline{z/OS\ C/C++\ Runtime\ Library}$  Reference.

**FOMR0329** 

Error using code pages toname and fromname - returning to default code pages

# **Explanation**

The current code pages are not working correctly. Returning to default code pages.

#### toname

EBCDIC code page.

### fromname

ASCII code page.

## **System action**

rlogind2 continues processing.

### System programmer response

Investigate why specified code pages are not working correctly.

**FOMR0330** 

Change to binary mode

# **Explanation**

The binary flag mode has been set to the tty. This informational message is issued to syslog only if rlogin daemon is started with the debug (-d) option.

# **System action**

rlogind2 continues processing.

#### **FOMR0331**

### Change to SingleByte pages toname, fromname

# **Explanation**

Single-byte conversion table is being initialized to handle new code pages. This informational message is issued to syslog only if rlogin daemon is started with the debug (-d) option.

#### toname

EBCDIC code page.

### fromname

ASCII code page.

# System action

rlogind2 continues processing.

### **FOMR0332**

## Change to MultiByte pages toname, fromname

# **Explanation**

Multibyte conversion table is being initialized to handle new code pages. This informational message is issued to syslog only if rlogin daemon is started with the debug (-d) option.

#### toname

EBCDIC code page.

### fromname

ASCII code page.

## System action

rlogind2 continues processing.

### **FOMR0333**

### **Unexpected input string**

# **Explanation**

iconv() call to translate the multi byte ASCII character to EBCDIC returned EINVAL error value. The input character is incomplete or invalid.

# **System action**

rlogind2 terminates.

## System programmer response

Investigate why input character is incomplete or invalid. For more information, consult <u>z/OS C/C++ Runtime</u> Library Reference.

**FOMR0334** 

### **Unexpected iconv error**

## **Explanation**

iconv() call to translate the multi byte ASCII character to EBCDIC failed.

# **System action**

rlogind2 terminates.

# System programmer response

Investigate why the iconv() code conversion request failed. For more information, consult z/OS C/C++ Runtime Library Reference.

### **FOMR0239**

Unsupported address family: n

# **Explanation**

Unsupported address family is specified.

n

Specified address family.

# System action

rlogin request terminates.

# System programmer response

Specify the correct address family. Supported address families are AF\_INET and AF\_INET6 (z/OS 1.4 or higher).

### FOMR0240

Getnameinfo on \"from\" address failed: errdesc

# **Explanation**

getnameinfo() call failed on from address.

#### errdesc

Error description associated with the error value returned from getnameinfo().

# **System action**

rlogin request terminates.

## System programmer response

Consult TCP/IP documentation and z/OS C/C++ Runtime Library Reference.. Determine why getnameinfo() call failed based on error description.

### **FOMR0241**

Couldn't look up address for hostname: errdesc

### **Explanation**

getaddrinfo() call failed for address lookup for the specified hostname.

### errdesc

Error description associated with the error value returned from getaddrinfo().

## **System action**

rlogin session continues.

### System programmer response

Consult TCP/IP documentation and z/OS C/C++ Runtime Library Reference. Determine why getaddrinfo() call failed based on error description.

### FOMR0242

### Host addr address not listed for host hostname

## **Explanation**

Specified host numerical address is not listed for canonical name or hostname.

#### address

Numerical address.

#### hostname

Name of the host.

# **System action**

rlogin session continues.

## System programmer response

Consult TCP/IP documentation and z/OS C/C++ Runtime Library Reference.

### **FSUC**

### FSUC0501

### Load average unavailable

# **Explanation**

The load average editing command could not be completed.

# **System action**

Command ends.

### FSUC0606

### No matching command

## **Explanation**

Command completion was not successful because the command does not exist.

## **System action**

Command ends.

## **User response**

Respecify statement with a valid command.

## **FSUC0607**

### **Ambiguous command**

## **Explanation**

Command completion as not successful because more than one command matched the specifications.

# **System action**

Command ends.

### **User response**

Respecify command in a more precise manner.

**FSUC0721** 

program-name: No entry for terminal type string

There was no entry for the specified terminal type in the terminfo database.

# **System action**

Processing continues.

FSUC0722

program-name: using dumb terminal settings.

# **Explanation**

No terminfo could be found, so a dumb terminal is being used.

# **System action**

Processing continues.

FSUC0801

Unknown switch

# **Explanation**

An incorrect option was passed to the setty command. Valid options are: a, q, d, x.

# **System action**

Command ends.

### User response

Correct the syntax, and reissue statement.

FSUC0802

**Invalid argument** 

## **Explanation**

An incorrect argument was passed to the setty command.

# **System action**

Command ends.

# **User response**

Check the syntax, and reissue command.

**FSUC0901** 

AddXkey: Null extended-key not allowed.

# **Explanation**

A null extended-key was issued on the bindkey command.

# **System action**

Command ends.

## **User response**

Reissue the command using a non-null extended-key.

### AddXkey: sequence-lead-in command not allowed

# **Explanation**

A sequence-lead-in command cannot be bound to multicharacter key binding.

# **System action**

Command ends.

## **User response**

Reissue statement with a different command.

**FSUC0903** 

DeleteXkey: Null extended-key not allowed.

# **Explanation**

A null extended-key was issued on the bindkey -r command.

# **System action**

Command ends.

## **User response**

Reissue the command using a non-null extended-key.

FSUC0904

Unbound extended key key

# **Explanation**

The specified key on the bindkey command was not bound to anything.

# **System action**

Command ends.

# **User response**

Respecify command with the proper syntax.

FSUC0905

Some extended keys too long for internal print buffer

## **Explanation**

The extended key was longer than the 95 character buffer limit.

# **System action**

Command ends.

**FSUC0907** 

no input

## **Explanation**

There is no specified function associated with this key.

Command ends.

#### **FSUC0908**

Something must follow: string

## **Explanation**

The syntax of your bindkey command is not correct.

# **System action**

Command ends.

## **User response**

Check syntax, and reissue statement.

#### **FSUC0909**

Octal constant does not fit in a char.

# **Explanation**

An octal constant was entered which is greater than 400.

# **System action**

Command ends.

#### User response

Respecify command with an octal value less than 400.

#### FSUC1101

Warning: no access to tty (string).

### **Explanation**

You do not have access to tty job control. The process specified does not belong to a process in the same session with the tty.

# **System programmer response**

setpgid() or tcsetpgrp() system call failed. These calls succeed only if processed by a super-user, or if id is the real or effective user(group) id of the calling process.

#### User response

Contact the system programmer.

#### **FSUC1102**

Thus no job control in this shell.

### **Explanation**

You do not have access to tty job control. The process specified does not belong to a process in the same session with the tty.

#### **System programmer response**

setpgid() or tcsetpgrp() system call failed. These calls succeed only if processed by a super-user, or if id is the real or effective user(group) id of the calling process.

# **User response**

Contact the system programmer.

**FSUC1305** 

string: shell built-in command.

## **Explanation**

The command specified is a shell built-in command. It is a registered command but not found in alias.

**FSUC1306** 

string: Command not found.

# **Explanation**

The command specified was not found. It is not a registered command nor an alias.

### **User response**

Check the syntax on the command issued, including options and arguments, and try again.

**FSUC1307** 

where: / in command makes no sense.

# **Explanation**

The command specified is not a valid command. Cannot process / in command.

## User response

Check the syntax on the command issued, including options and arguments, and try again.

**FSUC1308** 

string is aliased to.

## **Explanation**

If the command specified is an alias, then display its alias path.

**FSUC1309** 

string is a shell built-in.

# **Explanation**

The command specified is a shell built-in command.

**FSUC1501** 

string: string: Can't string string limit.

### **Explanation**

Unable to set/remove file size limits. Write to stderror file.

FSUC1607

Bad seek type *number*.

# **Explanation**

Bad seek type. Valid seek types are 0, 1, and 2.

#### **User response**

Respecify command with valid seek type.

FSUC1701

BUG: waiting for background job!.

Now keep pausing as long as we are not interrupted (SIGINT), and the target process, or any of its friends, are still running.

# **System programmer response**

Processing continues.

#### **User response**

Please wait for process to return.

**FSUC1703** 

BUG: process flushed twice.

## **Explanation**

Process id is 0.

# System programmer response

Process is ended.

**FSUC1708** 

BUG: status=status

#### **Explanation**

Unrecognized process status message received.

**FSUC1709** 

(core dumped).

### **Explanation**

Process ends with core dump.

**FSUC1712** 

string: Already suspended.

# **Explanation**

The current shell is suspended/stopped.

**FSUC1714** 

job: Cannot superkill a process group

### **Explanation**

A "kill -K" command specified either a process id (pid) of 0, a negative value, or a shell job, indicating that the superkill should be sent to a process group. This is not supported for superkill.

### **System action**

Processing of the job or pid job ends. If there are more arguments, the command continues.

#### **User response**

Issue the "kill -K" command only for positive pid values which have not terminated from a prior "kill -KILL".

**FSUC1715** 

pid: Cannot superkill pid -1 (all processes)

A "kill -K" command specified a process id (pid) of -1. Pid -1 indicates that the superkill should be sent to all processes for which you are authorized. This is not supported for superkill.

## **System action**

Processing of pid -1 ends. If there are more arguments, the command continues.

#### **User response**

Issue the "kill -K" command only for positive pid values which have not terminated from a prior "kill -KILL".

**FSUC1716** 

pid: Cannot superkill without prior KILL signal to process

## **Explanation**

A "kill -K" command specified a process id (pid) that had not been sent a KILL signal at least 3 seconds earlier.

# **System action**

Processing of *pid* ends. If there are more arguments, the command continues.

# **User response**

Issue the "kill -KILL" command for the pid. Wait 3 seconds. If the process does not terminate, then issue the "kill -K" command for the pid.

**FSUC1717** 

pid: \_\_superkill: reason code = reason\_code: errno string

# **Explanation**

A "kill -K" command specified a process id (*pid*) that had not been sent a KILL signal at least 3 seconds earlier. The errno string is displayed with this message.

# System action

Processing of pid ends. If there are more arguments, the command continues.

#### **User response**

Issue the "kill -KILL" command for the pid. Wait 3 seconds. If the process does not terminate, then issue the "kill -K" command for the pid.

**FSUC1801** 

Warning: ridiculously long PATH truncated.

# **Explanation**

Incorrect PATH specified. Exported path exceeds maximum buffer size.

**FSUC1802** 

Warning: unknown multibyte display; using default(euc(JP)).

#### **Explanation**

Incorrect multibyte display type. Using default multibyte display (euc(JP)).

**FSUC1803** 

Warning: unknown multibyte code number; multibyte disabled.

Incorrect multibyte code received. Multibyte disabled.

**FSUC1804** 

Warning: Invalid multibyte table length (number); multibyte disabled.

### **Explanation**

Incorrect multibyte table length. Multibyte disabled.

**FSUC1805** 

Warning: bad multibyte code at offset +number; multibyte disabled.

# **Explanation**

Bad multibyte code at offset. Multibyte disabled.

FSUC2001

Invalid key name string.

# **Explanation**

The specified key name is not valid.

FSUC2002

Bad key name: string.

### **Explanation**

The specified key name is not valid.

FSUC2003

Bad command name: string.

# **Explanation**

The command name is not valid.

FSUC2004

Bad key spec string.

### **Explanation**

Bad key specified.

FSUC2005

Null string specification.

# **Explanation**

String is empty.

FSUC2203

Faulty alias precmd removed.

# **Explanation**

You cannot alias precmd.

FSUC2204

Faulty alias cwdcmd removed.

### **Explanation**

You cannot alias cwdcmd.

FSUC2205

Faulty alias beepcmd removed.

#### **FSUC** messages

## **Explanation**

You cannot alias beepcmd.

FSUC2206

Faulty alias periodic removed.

## **Explanation**

You cannot alias periodic.

**FSUC2323** 

getwd: Cannot stat / (string).

# **Explanation**

Unable to get status of / directory. Write to stderror file.

FSUC2324

getwd: Cannot stat . (string).

# **Explanation**

Unable to get status of . directory. Write to stderror file.

**FSUC2325** 

getwd: Cannot stat directory string (string).

## **Explanation**

Unable to get status of working directory. Write to stderror file.

**FSUC2326** 

getwd: Cannot open directory string (string).

# **Explanation**

Unable to open working directory. Write to stderror file.

FSUC2327

getwd: Cannot find . in .. (string).

## **Explanation**

Unable to find . in .. directory. Write to stderror file.

**FSUC2333** 

Unexpected \_\_writedown query return value number

#### **Explanation**

A \_\_writedown query operation returned a value that is not recognized by the writedown command.

### **System programmer response**

Follow local procedures for reporting problems to IBM.

#### User response

Contact your system programmer.

FSUC2502

error: bsd\_signal(number) signal out of range.

### **Explanation**

Bsd signal is out of range.

## **System programmer response**

Determine why bsd\_signal was out of range.

## **User response**

Contact your system programmer.

FSUC2503

error: bsd\_signal(number) - sigaction failed, errno number.

# **Explanation**

Bsd signal failed.

# System programmer response

Determine why bsd signal failed.

## **User response**

Contact your system programmer.

FSUC2601

cannot stat string. Please unset watch.

# **Explanation**

Unable to get temporary file status.

# **User response**

Verify that temporary file exists and \_PATH\_UTMP temporary file environmental variable has been set.

FSUC2602

string cannot be opened. Please unset watch.

### **Explanation**

Unable to open temporary file.

### **User response**

Verify that temporary file exists and \_PATH\_UTMP temporary file environmental variable has been set.

**FSUC2607** 

name has terminal date from host.

#### **Explanation**

Display current element data with host field.

FSUC3004

string: Internal match error.

# **Explanation**

An internal editing command error has occured.

# **System action**

# System programmer response

Follow local procedures for reporting a problem to IBM.

## **User response**

Contact your system administrator.

FSUC3009

tcsh internal error: I don't know what I'm looking for!

# **Explanation**

An internal error has occurred for a completion command.

# System action

Command ends.

# System programmer response

Follow local procedures for reporting a problem to IBM.

## **User response**

Contact your system programmer.

**FSUC3110** 

not a directory

## **Explanation**

Completion cannot process successfully because the specified name is not a valid directory.

### **System action**

Command ends.

# **User response**

Reissue the command with a valid directory name.

**FSUC3111** 

not found

### **Explanation**

Completion cannot process successfully because the specified file/directory name cannot be found.

### **System action**

Command ends.

#### **User response**

Reissue the command with a valid file/directory name.

**FSUC3112** 

unreadable

## **Explanation**

Completion cannot process successfully because the specified file/directory name cannot be read.

Command ends.

#### **User response**

Change permissions of file/directory, or reissue the command with a different, readable file/directory.

FSUC5001

**Syntax Error** 

# **Explanation**

A command or construct was issued with incorrect syntax.

# System action

Command ends.

### **User response**

Check the syntax on the command or construct and reissue.

FSUC5002

string is not allowed

# **Explanation**

You are not allowed to have a < or a numerical digit after a \$?, \$#, or \$%.

# **System action**

Command ends.

### **User response**

Correct the syntax and reissue the command.

FSUC5003

Word too long

# **Explanation**

Word used in \$ expansion, command substitution or history substitution is more than the buffer can hold.

### **System action**

Command ends.

#### **User response**

Try to split the expansion to use multiple smaller expansions.

FSUC5004

\$< line too long

# **Explanation**

The input value for \$< is longer than the buffer allows.

# **System action**

#### **FSUC** messages

## **User response**

Try to shorten the input and/or split input between multiple reads.

FSUC5005

No file for \$0

# **Explanation**

\$0 is the name for the current shell input file. If unknown, this var is unset, and any reference to it is an error.

# **System action**

Command ends.

# **User response**

Set \$0 and reissue command.

FSUC5006

Incomplete [] modifier

# **Explanation**

A newline or EOF indicator was reached before the ending ].

# **System action**

Command ends.

#### User response

Respecify command with correct syntax.

FSUC5007

\$ expansion must end before ]

### **Explanation**

The \$ expansion was incomplete before reaching the ] character.

# **System action**

Command ends.

# **User response**

Respecify command, placing the ] character after variable expansion.

FSUC5008

Bad: modifier in \$ (character)

# **Explanation**

Valid modifiers are limited to luhtraxes.

# **System action**

Command ends.

### **User response**

Respecify command with valid modifiers.

FSUC5009

Subscript error

# **Explanation**

The closing ] on the array subscript was not found after a numerical value.

# **System action**

Command ends.

### **User response**

Correct the syntax and reissue the command.

FSUC5010

**Badly formed number** 

# **Explanation**

Statement indicated requires numerical value.

# **System action**

Command ends.

### **User response**

Check the syntax and reissue the statement.

**FSUC5011** 

No more words

# **Explanation**

argy or variable specified on shift command is either not set or has less than one word as value.

# **System action**

Command ends.

# **User response**

Set the shift argument to have enough words, or stop using shift command when all words are shifted.

**FSUC5012** 

Missing file name

### **Explanation**

Command specified is expecting a filename to be passed as an argument.

# **System action**

Command ends.

## **User response**

Respecify the command with the appropriate filename.

**FSUC5013** 

Internal glob error

#### **FSUC** messages

### **Explanation**

An internal glob error has occurred.

# **System action**

Command ends.

# System programmer response

Follow your local procedures for reporting a problem to IBM.

### **User response**

Contact the system programmer or try and reissue the statement without glob characters.

#### FSUC5014

Command not found

## **Explanation**

The command specified was not found in your search path.

# **System action**

Command ends.

## **User response**

Check if the command exists, change search path as necessary.

#### FSUC5015

Too few arguments

### **Explanation**

Function specified requires more arguments than you have listed.

# System action

Command ends.

#### **User response**

Check command syntax and reissue the statement.

#### **FSUC5016**

Too many arguments

### **Explanation**

Function specified requires fewer arguments than you have listed.

# **System action**

Command ends.

### **User response**

Check the command syntax and reissue the statement.

#### **FSUC5017**

Too dangerous to alias that

It is not valid to alias the commands alias and unalias.

# **System action**

Command ends.

### **User response**

Do not try and alias these commands.

**FSUC5018** 

**Empty if** 

# **Explanation**

The value of the if command cannot be NULL.

# **System action**

Command ends.

#### **User response**

Issue if statement with non-null expression.

FSUC5019

Improper then

# **Explanation**

then statement must be followed by a command.

# **System action**

Command ends.

### **User response**

Reissue then followed by a valid command.

**FSUC5020** 

Words not parenthesized

### **Explanation**

The wordlist within the foreach statement must be enclosed in parenthesis.

### **System action**

Command ends.

### **User response**

Enclose the wordlist in parenthesis and reissue the statement.

FSUC5021

string not found

### **Explanation**

Either a then, endif, endsw, end or a case label statement was not found.

#### **FSUC** messages

## **System action**

Command ends.

#### **User response**

Check the syntax of conditional statement, adding appropriate tag.

#### FSUC5022

Improper mask

# **Explanation**

Masking values for the umask command must be between 0 and 777.

# System action

Command ends.

### **User response**

Reissue the umask command with the appropriate masking values.

#### **FSUC5023**

No such limit

# **Explanation**

The resource value specified for the limit command does not exist. Controllable resources are: cputime, filesize, datasize, stacksize, coredumpsize, and memoryuse.

# **System action**

Command ends.

#### **User response**

Reissue limit command with one of the resources listed above.

#### FSUC5024

**Argument too large** 

# **Explanation**

You have exceeded the maximum or minimum value defined on your system.

# **System action**

Command ends.

#### User response

If possible, respecify argument within appropriate boundaries.

# FSUC5025

Improper or unknown scale factor

# **Explanation**

The scale factor for the maximum use field of the limit command is not valid. Valid values are either k for kilobytes, or m for megabytes.

Command ends.

#### **User response**

Reissue limit command with an appropriate scale factor.

#### FSUC5026

**Undefined variable** 

## **Explanation**

Variable used in specified command is undefined.

# **System action**

Command ends.

### **User response**

Define variable with the set command before using.

### FSUC5027

**Directory stack not that deep** 

# **Explanation**

The numerical value following the = is greater than the size of the directory stack.

# System action

Command ends.

### **User response**

You can find out how deep the directory stack is with the dirs -v command. Reissue =n where n is no greater than the largest stack value.

#### **FSUC5028**

Bad signal number

# **Explanation**

The user specified an unknown signal number on the kill command.

# **System action**

Command ends.

#### User response

Valid signal names and numbers are listed in <u>kill - End a process or job, or send it a signal</u> in *z/OS UNIX System Services Command Reference*.

#### **FSUC5029**

Unknown signal; kill -l lists signals

# **Explanation**

The user specified an unknown signal on the kill command.

Command ends.

#### **User response**

The -l option will list valid signal names. Reissue the command with a valid signal name.

#### FSUC5030

Variable name must begin with a letter

## **Explanation**

The variable being initialized after the set command must begin with a letter.

# System action

Command ends.

### **User response**

Change name of variable so that a character occupies the first position.

#### FSUC5031

Variable name too long

## **Explanation**

The variable name after the set command cannot exceed 30 characters in length.

## System action

Command ends.

### **User response**

Shorten variable name to less than 30 characters.

#### FSUC5032

Variable name must contain alphanumeric characters

# **Explanation**

Variable name after the set command is expected to consist only of alphabetic characters, or a combination of alphabetic and numeric characters where the first letter in the variable name is alphabetic.

## **System action**

Command ends.

#### User response

Change variable name to meet syntax guidelines.

# **FSUC5033**

No job control in this shell

## **Explanation**

This shell does not have job control capabilities.

### **System action**

## **User response**

Do not issue any job control commands.

#### FSUC5034

#### **Expression Syntax**

# **Explanation**

Syntax of specified command is not correct.

## System action

Command ends.

## **User response**

Check syntax and respecify command.

#### FSUC5035

No home directory

# **Explanation**

The \$home variable is not set, therefore you cannot issue the cd or chdir command without any arguments.

# **System action**

Command ends.

#### User response

Either set \$home or specify a directory on the cd or chdir command.

# FSUC5036

Can't change to home directory

# **Explanation**

The \$home variable is not set so using the '~' character to reference your home directory is not valid.

# **System action**

Command ends.

# **User response**

Either set \$home or explicitly specify directory.

#### **FSUC5037**

Invalid null command.

# **Explanation**

An unexpected NULL string was encountered.

# **System action**

Command ends.

### **User response**

Check syntax and reissue command.

#### **FSUC5038**

#### **Assignment missing expression**

# **Explanation**

The @ name=expr command is missing the expr argument.

# **System action**

Command ends.

### **User response**

Reissue statement specifying expr argument.

**FSUC5039** 

**Unknown operator** 

# **Explanation**

The operator used in the @ command is not valid.

# **System action**

Command ends.

### **User response**

Check syntax and reissue statement.

**FSUC5040** 

**Ambiguous** 

# **Explanation**

Specified function is ambiguous.

# **System action**

Command ends.

## **User response**

Check syntax, and reissue the statement.

FSUC5041

filename: File exists

### **Explanation**

The specified file already exists and cannot be appended to or overwritten.

# **System action**

Command ends.

# **User response**

Use a different filename, or rename existing file.

FSUC5042

Argument for -c ends in backslash

The -c tcsh option cannot be used with a script file that ends in a backslash.

# **System action**

Command ends.

### **User response**

Change name of script so that it does not end in a backslash.

FSUC5043

Interrupted

# **Explanation**

A SIGINT has been received. Specified process has been interrupted.

## **System action**

Specified process has been interrupted.

FSUC5044

Subscript out of range

# **Explanation**

User tried to access a value outside the scope of the array.

# **System action**

Command ends.

### **User response**

The \$#variable command will tell you how many elements are in the array. Your subscript value must be an integer no greater than this value, but no less than one.

FSUC5045

Line overflow

## **Explanation**

A line within the here-document notation exceeded the 1020 character limit.

# **System action**

Command ends.

#### User response

Use multiple here-documents, so that you can split the input such that it fits within this character limit.

FSUC5046

No such job

# **Explanation**

There is no job with the corresponding name/number.

# **System action**

### **User response**

The jobs -1 command will list all current jobs, along with their corresponding process id's. Any job specified must be listed in the jobs -1 output.

#### FSUC5047

#### Can't from terminal

# **Explanation**

The onintr command cannot be issued from a terminal. The hup and nohup commands cannot be issued from a terminal without a corresponding command.

# **System action**

Command ends.

#### **User response**

The onintr command can be issued from a script. The hup and nohup commands must be issued with a corresponding command, or can be issued without commands from a script.

#### FSUC5048

#### Not in while/foreach

### **Explanation**

A break, end, or continue statement can only be issued from inside a while or foreach loop.

# **System action**

Command ends.

# **User response**

Check syntax of statement. Make any necessary changes and reissue.

#### FSUC5049

#### No more processes

## **Explanation**

There are insufficient resources to create another process, or you have already reached the maximum number of processes you can run.

### **System action**

Command ends.

### System programmer response

Determine why fork() failed.

#### User response

Contact your system administrator.

#### FSUC5050

#### No match

# **Explanation**

The wildcard expansion issued in your statement does not expand to a valid argument.

Command ends.

# **User response**

Be more explicit when issuing this statement.

FSUC5051

Missing character

# **Explanation**

Statement missing either -, }, ], or ).

# **System action**

Command ends.

### **User response**

Check syntax and respecify.

FSUC5052

**Unmatched** character

# **Explanation**

A closing ' or " is missing from your statement.

# **User response**

Check syntax and respecify.

FSUC5053

**Out of memory** 

# **Explanation**

There were not enough system resources to allocate the required memory.

# **System action**

Command ends.

# **User response**

Free up more system resources and try again, or contact your system administrator for additional help.

FSUC5054

Can't make pipe

# **Explanation**

Pipe command cannot be processed.

# **System action**

Command ends.

### **User response**

Check syntax and reissue statement.

FSUC5055 function: return-code

## **Explanation**

A system error has occured for the specified function.

## System action

Command ends.

## System programmer response

Follow local procedures for reporting a problem to IBM.

### **User response**

A correlating return code has been given. Contact your system administrator.

FSUC5058

Arguments should be jobs or process id's

# **Explanation**

Arguments to the specified command need to be either jobs or process id's. These can be found using the jobs -1 builtin command.

# System action

Command ends.

# User response

Respecify command with arguments that are found in the jobs -1 command.

FSUC5059

No current job

### **Explanation**

Specified command cannot process because there is no current job.

# **System action**

Command ends.

**FSUC5060** 

No previous job

### **Explanation**

Specified command cannot process because there is no previous job.

### System action

Command ends.

FSUC5061

No job matches pattern

### **Explanation**

There is no job that matches string in the '%?string' reference.

Command ends.

## **User response**

You can get a list of all current jobs with the jobs command. Use a job from within that list.

FSUC5062

Fork nesting > number; maybe '...' loop

## **Explanation**

There is a maximum nesting limit of 16 processes. This is done to avoid forking loops.

# **System action**

Command ends.

## **User response**

Try to minimize the use of subshells and nested calls to builtin functions.

**FSUC5063** 

No job control in subshells

# **Explanation**

Job commands can only be issued from the parent shell.

# System action

Command ends.

#### **User response**

Return to parent shell and reissue command.

FSUC5065

string There are suspended jobs

# **Explanation**

There are suspended jobs in the shell that prevent you from exiting.

### **System action**

Command ends, shell still remains active.

#### **User response**

To find out what jobs are suspended, issue the jobs command and either resume or kill these jobs.

**FSUC5067** 

No other directory

# **Explanation**

The pushd command with no arguments will exchange the top two elements in the stack. In this case, it cannot process because there is only one directory entry in the stack.

### **System action**

### **User response**

Cannot issue command until there is more than one entry in the stack.

#### **FSUC5068**

#### **Directory stack empty**

## **Explanation**

The directory stack is empty, so the popd command can neither print values, nor remove directories from it.

# **System action**

Command ends.

# **User response**

Cannot issue command until there are entries in the stack.

#### FSUC5069

**Bad directory** 

# **Explanation**

The directory specified on the popd command is not valid.

# **System action**

Command ends.

#### User response

Respecify with a valid entry from the stack. This can be found using the dirs builtin command.

#### **FSUC5071**

No operand for -h flag

# **Explanation**

When using the source -h command, no operand was given.

# **System action**

Command ends.

### **User response**

Reissue with an argument after -h.

#### **FSUC5072**

Not a login shell

## **Explanation**

The login and logout commands both terminate the login shell. These commands cannot process if they are issued from a non-login shell.

# **System action**

Command ends, shell still remains active.

### **User response**

To exit, issue the exit command.

118 z/OS: z/OS UNIX System Services Messages and Codes

**FSUC5073** 

Division by 0

# **Explanation**

Divide by 0 is not allowed.

# **System action**

Command ends.

## **User response**

Respecify equation so that a divide by 0 does not occur.

FSUC5074

Mod by 0

# **Explanation**

In the expression a%b, b was evaluated to be 0 which attempts a divide by 0.

# **System action**

Command ends.

### **User response**

Respecify statement so that b does not equate to 0

FSUC5075

Bad scaling; did you mean string?

# **Explanation**

Scale factors for all resources besides cputime default to k or kilobytes. A scale factor of m or megabytes may also be used. For cputime, the default scaling is in seconds, but m for minutes, h for hours or a time form of mm:ss (where m=minutes and s=seconds) may also be used.

# **System action**

Command ends.

### **User response**

Respecify the limit command with syntax in the proper format.

**FSUC5076** 

Can't suspend a login shell (yet)

## **Explanation**

The suspend command cannot be issued when operating from a login shell.

# **System action**

Command ends, shell still remains active.

#### **User response**

Try using the logout command instead.

FSUC5077

Unknown user: user

#### **FSUC** messages

### **Explanation**

The user specified in *user* does not exist.

# **System action**

Command ends.

# **User response**

Check that the user exists, check spelling.

**FSUC5078** 

No \$home variable set

# **Explanation**

Cannot cd to the home directory as the \$home variable is not set.

# **System action**

Command ends.

## **User response**

Set the \$home variable, and the reissue command.

FSUC5080

\$, ! or < not allowed with \$# or \$?

# **Explanation**

An illegal \$, ! or < was found in the name portion of \$# name or \$?name.

## **System action**

Command ends.

# **User response**

Reissue this shell variable without the illegal characters.

FSUC5081

Newline in variable name

### **Explanation**

An illegal newline character was found in the variable name.

## **System action**

Command ends.

#### **User response**

Respecify the variable name to exclude any newlines. Respecify the command.

FSUC5082

\* not allowed with \$# or \$?

# **Explanation**

A wildcard character was found in name portion of either \$#name or \$?name

Command ends.

## **User response**

Respecify the shell variable reference without a \* in name.

#### FSUC5083

\$?<digit> or \$#<digit> not allowed

# **Explanation**

\$? or \$# cannot be followed by a digit.

# System action

Command ends.

## **User response**

Respecify the shell variable reference with a variable name as an argument.

#### FSUC5084

Illegal variable name

# **Explanation**

Variable name must consist only of alphanumeric characters.

# **System action**

Command ends.

### **User response**

Take any non-alphnumeric characters out of the variable name.

#### FSUC5085

Newline in variable index

# **Explanation**

A newline character is not allowed in the index of an array.

### **System action**

Command ends.

#### **User response**

Respecify array[index] without any newlines in index.

# FSUC5086

**Expansion buffer overflow** 

# **Explanation**

While attempting to resolve a variable expansion ( such as \$expression ), the 1020 character buffer limit was exceeded .

## **System action**

#### **FSUC** messages

### **User response**

Try and minimize complex expressions.

#### FSUC5087

Variable syntax

## **Explanation**

Variable modifiers cannot have a :g or :a at the end of the word selector.

# **System action**

Command ends.

# **User response**

Correct the syntax of modifiers, and the reissue command.

FSUC5088

Bad! form

# **Explanation**

No closing } was found on the ! history substitution character.

# **System action**

Command ends.

#### User response

Correct the syntax of the statement and reissue.

FSUC5089

No previous substitute

### **Explanation**

There is no previous s substitution for the "modifier to repeat.

# **System action**

Command ends.

### **User response**

Cannot use this modifier until you issue a valid s substitution. Use another form and/or combination of modifiers to process desired history substitution.

#### FSUC5090

**Bad substitute** 

### **Explanation**

The :s/x/y/ modifier format is not of proper syntax.

# **System action**

Command ends.

### **User response**

Correct the syntax, and reissue the statement.

122 z/OS: z/OS UNIX System Services Messages and Codes

#### **FSUC5091**

#### No previous left hand side

# **Explanation**

There is no previous left hand side for the :s/x/y/ modifier format.

# **System action**

Command ends.

### **User response**

Correct the syntax, and reissue the statement.

### FSUC5092

Right hand side too long

# **Explanation**

The right hand side of the :s/x/y/ modifier format is too long.

# **System action**

Command ends.

### **User response**

Try to shorten the substitution, try and use another form of history substitution, or manually type in command line.

**FSUC5093** 

Bad! modifier: modifier

# **Explanation**

Valid modifiers are: p s & r e h t q x u l g and a.

# **System action**

Command ends.

### **User response**

Respecify command with valid modifiers.

FSUC5094

**Modifier failed** 

### **Explanation**

Specified modifier could not complete properly.

# **System action**

Command ends.

### **User response**

Check syntax and logic of the statement.

FSUC5095

Substitution buffer overflow

Command ends.

**FSUC5096** 

Bad! arg selector

## **Explanation**

The % modifier must be used in conjunction with the !?string? reference (for example, !?string?:%) where % will match the entire word matching string.

# **System action**

Command ends.

## **User response**

Correct the syntax and reissue the statement.

**FSUC5097** 

No prev search

# **Explanation**

!?? will repeat the last search command. In this case, there is no previous search command, therefore, this form of history substitution cannot process.

# **System action**

Command ends.

# User response

Use another form of history substitution.

**FSUC5098** 

string: Event not found

### **Explanation**

!?string? will be replaced with the most recent history line containing string in line. No match was found, hence, no history substitution can occur.

# **System action**

Command ends.

#### User response

Use another form of history substitution, or explicitly type in the command.

**FSUC5099** 

Too many )'s

### **Explanation**

There are more closing parenthesis than opening parenthesis.

### **System action**

## **User response**

Correct the syntax and reissue the statement.

# FSUC5100

Too many ('s

## **Explanation**

There are more opening parenthesis than closing parenthesis.

# **System action**

Command ends.

# **User response**

Correct the syntax and reissue the statement.

#### FSUC5101

Badly placed (

# **Explanation**

The syntax of your statement is not correct due to a misplaced (.

# **System action**

Command ends.

#### User response

Correct the syntax and reissue the statement.

#### FSUC5102

Missing name for redirect

### **Explanation**

The < or > redirection symbols were used without the appropriate source or target arguments.

# **System action**

Command ends.

# **User response**

Reissue the statement with valid arguments on redirection.

#### **FSUC5103**

**Ambiguous output redirect** 

# **Explanation**

Output redirection cannot process because the filename and/or pipe is ambiguous.

# **System action**

Command ends.

### **User response**

Correct the syntax, and reissue the statement.

#### **FSUC5104**

Can't << within ()'s

# **Explanation**

The << redirection symbol cannot be used within a set of parenthesis.

## System action

Command ends.

## **User response**

Reissue the statement without this symbol inside the ()'s. You may want to try putting the << shell input lines inside a variable, or within a file.

#### **FSUC5105**

**Ambiguous input redirect** 

# **Explanation**

Input redirection cannot process because the filename and/or pipe is ambiguous.

# **System action**

Command ends.

#### User response

Correct the syntax, and reissue the statement.

#### **FSUC5106**

Badly placed ()'s

### **Explanation**

The syntax of your statement is not correct due to a misplaced parenthesis.

### System programmer response

Command ends.

## **User response**

Correct the syntax and reissue the statement.

#### **FSUC5107**

Alias loop

#### **Explanation**

You have exceeded the maximum value of 50 nested alias expansions.

### System action

Command ends.

### **User response**

If possible, do not nest this alias.

#### **FSUC5108**

No \$watch variable set

The log'/'watchlog command cannot process because the \$watch variable was not set.

# **System action**

Command ends.

# **User response**

You must set the \$watch variable in order to use this command.

#### **FSUC5109**

No scheduled events

# **Explanation**

The -n option on the sched command cannot process because there are no scheduled events to remove.

# **System action**

Command ends.

## **User response**

There are no scheduled events to remove, therefore you don't need to take further action.

#### **FSUC5111**

Not that many scheduled events

# **Explanation**

The -n option on the sched command cannot process because there are not n number of scheduled events.

## **System action**

Command ends.

# **User response**

To see what the correct number of the event is, use the sched command with no arguments. Reissue sched -n with the correct n value.

# **FSUC5112**

No command to run

# **Explanation**

A corresponding command for the sched command was not given.

## **System action**

Command ends.

#### **User response**

Reissue the command with the correct syntax.

### **FSUC5113**

**Invalid time for event** 

# **Explanation**

The time for the sched command is not valid.

Command ends.

#### **User response**

Correct time syntax and reissue statement.

#### FSUC5114

#### Relative time inconsistent with am/pm

# **Explanation**

Relative time cannot have an AM/PM extension. Relative time is number of hours and minutes away from the current time.

# **System action**

Command ends.

# **User response**

Reissue the statement without AM/PM extension.

## **FSUC5117**

Unknown capability capability

# **Explanation**

The terminal capability passed into the settc command is unknown.

# **System action**

Command ends.

#### **User response**

Reissue statement with a correct terminal capability.

#### **FSUC5118**

Unknown termcap parameter parameter

# **Explanation**

Valid termcap parameters are: d,2,3,.,+,%,>,i,r,n,B,D

# **System action**

Command ends.

#### User response

Reissue statement with a valid termcap parameter.

## **FSUC5119**

Too many arguments for command (arguments-required)

# **Explanation**

More arguments were given for the specified command than it's syntax allows.

## **System action**

## **User response**

Correct syntax and reissue statement.

#### **FSUC5120**

#### command requires number arguments

## **Explanation**

The command specified is not in proper syntax.

# **System action**

Command ends.

# **User response**

Correct syntax and reissue command.

#### FSUC5122

file: return-code. Binary file not executable.

# **Explanation**

File failed execution with the specified return code. Even though the file has the proper permissions, it is not an executable file.

# **System action**

Command ends.

## User response

See the return code description for how to proceed. Check the spelling of the command entered.

#### **FSUC5123**

!# History loop

### **Explanation**

The !# event specification for history substitution has reached its maximum of 10 levels of recursion.

# **System action**

Command ends.

### **User response**

Either use another form of history substitution or explicitly type in command.

#### **FSUC5124**

### Malformed file inquiry

# **Explanation**

The syntax of the filetest command is incorrect.

# **System action**

Command ends.

### **User response**

Correct the syntax, making sure to check the file inquiry operator is valid.

### **FSUC5125**

#### Selector overflow

## **Explanation**

Expansion of the selector expression exceeded the 2056 character limit.

# **System action**

Command ends.

### **User response**

Try and simplify the expression.

**FSUC5129** 

Invalid completion: argument

# **Explanation**

The specified list argument for the completion rule is not valid.

# **System action**

Command ends.

### **User response**

Correct syntax using a valid list specifier.

**FSUC5130** 

Invalid string: string

# **Explanation**

The specified command or separator field is not of the correct syntax.

# **System action**

Command ends.

## **User response**

Correct syntax and reissue completion rule.

**FSUC5131** 

Missing separator separator after string string

### **Explanation**

The syntax of the completion statement is not correct due to the specified missing separator.

# **System action**

Command ends.

### **User response**

Correct syntax and reissue statement.

**FSUC5132** 

Incomplete command: string

There is no specified range for the positional completion rule.

# **System action**

Command ends.

#### **User response**

Respecify rule with correct syntax.

**FSUC5133** 

No operand for -m flag

# **Explanation**

The syntax for the -m option on the source command is incorrect.

# **System action**

Command ends.

## **User response**

Reissue statement with correct syntax.

**FSUC5135** 

\$variable is read-only

# **Explanation**

The specified variable is read only. Any operations that may need to write, append or delete this variable cannot be processed.

## **System action**

Command ends.

# **User response**

Do not set this variable as read only, or use another variable.

**FSUC5136** 

No such job

# **Explanation**

The job specified on the command does not exist. You can get a list of jobs and their corresponding process ID's by issuing the jobs -1 command.

# **System action**

Command ends.

#### **User response**

Reissue command with a valid job.

**FSUC5137** 

Unknown colorls variable variable

The LS\_COLORS shell variable could not be processed because the specified variable is not valid.

# **System action**

Command ends.

## **User response**

Correct syntax and reissue statement.

#### **FSUC5138**

#### The autolock feature is not implemented

# **Explanation**

The command set autologout=(x y) was issued in which the y variable was intended to specify the number of minutes the shell can sit idle before it automatically locks.

# **System action**

The autologout command is still implemented, however autologout takes on the value of the y variable, rather than the x.

## **User response**

If this is not the value you want to take effect for autologout, respecify the statement with only one parameter.

FSUC5140

pid/job-number: string

# **Explanation**

The kill() run-time function failed with the specified pid/job number and returned the printed system message. Either the specified signal isn't supported, the caller does not have permission to send to the process specified, or there are no processes corresponding to the specified pid.

# **System action**

The kill command terminates without sending the signal to the process/job.

# **User response**

Double-check the value of the pid or job number you used when issuing the kill command.

#### **FSUC5141**

The afsuser special shell variable is not implemented

# **Explanation**

Since the autolock feature is not implemented, setting this variable offers no benefit.

# **System action**

Processing continues.

### User response

None.

**FSUC5142** 

The autocorrect special shell variable is not implemented

Setting this variable will not automatically invoke the spell-word editor command before each completion attempt.

## **System action**

Processing continues.

## **User response**

To spell check a word, you can manually invoke the spell-word editor command. To find out what this command is mapped to, issue the bindkey command

## **FSUM**

#### FSUM1001

The RACF profile for this user does not contain an OMVS segment.

# **Explanation**

The RACF profile for this user does not contain an OMVS segment. Processing terminates.

## System programmer response

Verify if this user has the authority to issue the OMVS command. If so, add an OMVS segment to the RACF profile for this user.

## **User response**

Contact the system administrator.

#### FSUM1002

Unable to set the LOGNAME environment variable.

# **Explanation**

A failure occurred while the LOGNAME environment variable was being set. Processing terminates.

### System programmer response

Determine why the setenv() function failed.

#### **User response**

Contact the system programmer.

#### **FSUM1003**

Unable to set the HOME environment variable.

# **Explanation**

A failure occurred while the HOME environment variable was being set. Processing terminates.

#### System programmer response

Verify that the OMVS segment of the user's RACF profile contains a home directory. Determine why the setenv() function failed.

#### **User response**

Contact the system programmer.

#### **FSUM1004**

Cannot change to directory < string>.

## **Explanation**

The current working directory cannot be set to the specified HOME directory for this user ID. Processing terminates.

## System programmer response

Verify that the home directory specified in the OMVS segment of the user's RACF profile exists. Verify that the user has the authority to make this directory the current working directory.

### **User response**

Contact the system administrator.

**FSUM1005** 

Unable to set the SHELL environment variable.

## **Explanation**

A failure occurred while the SHELL environment variable was being set. Processing terminates.

## System programmer response

Verify that the OMVS segment of this user's RACF profile contains an initial user program name. Determine why the setenv() function failed.

## **User response**

Contact the system programmer.

**FSUM1006** 

A shell was not specified. Processing continues using the default shell name.

## **Explanation**

The name of the initial user program (shell) was not specified in the OMVS segment of the user's RACF profile. Processing continues using the default shell name.

# System programmer response

Verify that the OMVS segment of this user's RACF profile contains an initial user program (shell) name.

#### **User response**

Contact the system administrator.

**FSUM1007** 

Unable to open the message catalog.

# **Explanation**

The message catalog cannot be opened. Processing continues.

#### System programmer response

Verify that the message catalog exists in the file system.

## **User response**

Contact the system programmer.

#### **FSUM1008**

Unable to close the message catalog.

### **Explanation**

The message catalog cannot be closed.

# System programmer response

Investigate why the catclose() function failed.

## **User response**

Contact the system programmer.

FSUM1009

Unable to execute the shell.

# **Explanation**

The initial user program (shell) was not run. Processing terminates.

## System programmer response

Verify that the initial user program (shell) exists, and that the user has permission to execute it.

### **User response**

Contact the system programmer.

#### FSUM1010

Cannot obtain the TTY name.

### **Explanation**

The TTY name associated with this terminal could not be obtained. No entry will be made in the /etc/utmpx file. Processing continues.

# System programmer response

Investigate why the ttyname() function failed.

#### **User response**

Contact the system programmer.

#### **FSUM1011**

Unable to remove the TTY pathname.

## **Explanation**

The pathname could not be removed from the TTY name. No entry will be made in the /etc/utmpx file.

#### System programmer response

Verify that the pathname for the TTY is correct.

#### **User response**

Contact the system programmer.

#### **FSUM1012**

#### The initial working directory was not specified.

## **Explanation**

The initial working directory was not specified in the OMVS segment of the user's RACF profile. The initial working directory will be set to the root (/) directory. Processing continues.

# System programmer response

Verify that the OMVS segment of the user's RACF profile contains an initial working directory.

### **User response**

Contact the system programmer.

#### **FSUM1013**

The name of the default shell could not be found.

# **Explanation**

The name of the default shell could not be obtained. Processing terminates.

## System programmer response

Contact IBM support personnel.

#### User response

Contact the system programmer.

#### **FSUM1014**

Unable to allocate storage.

### **Explanation**

The system could not allocate enough storage to continue. Processing terminates.

#### System programmer response

Determine why there is not enough storage to be allocated.

#### **User response**

Contact the system programmer.

#### **FSUM1015**

Unable to set the TZ environment variable.

### **Explanation**

The default time zone could not be set. Processing continues.

# System programmer response

Determine why the setenv() function failed.

#### User response

Contact the system programmer.

#### **FSUM1016**

Unable to determine the default path.

The name of the default path name could not be determined. The path name will be set to /bin. Processing continues.

## System programmer response

Contact IBM support personnel.

### **User response**

Contact the system programmer.

#### **FSUM1017**

Unable to set the PATH environment variable.

## **Explanation**

A failure occurred while the PATH environment variable was being set. Processing continues.

# System programmer response

Determine why the setenv() function failed.

# User response

Contact the system programmer.

#### **FSUM1018**

The start of the session was not recorded. An unexpected error occurred. Error code = number, reason code = hexnum, error data = hexnum, error string = 'string'

# **Explanation**

The start of the shell session was not recorded in the /etc/utmpx file, because an unexpected error occurred. This error did not prevent the session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

This error message can occur if the /bin/login, program is accidentally run as a shell command.

In the message text:

#### error code = *number*

The code for this error.

#### reason code = hexnum

An additional reason code associated with this error. If this value is zero, there is no additional reason code for this error.

#### error data = *hexnum*

Additional data associated with this error. If this value is zero, there is no additional reason code for this error.

#### error string = 'string'

A string of characters that provides additional error information. If this string is empty, no error string is available for this error.

#### System programmer response

This might be an error in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.

#### **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

Make sure not to run /bin/login, as a shell command.

#### **FSUM1019**

The start of the session was not recorded. The slot (in /etc/utmpx) for this terminal could not be updated, or a new slot for the terminal could not be created. Function = pututxline(), terminal name = 'string', program name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

The login program tried to record the start of the user's shell session in the /etc/utmpx file. An error occurred when the login program issued pututxline(). The start of the shell session was probably not recorded. This error did not prevent the session from starting.

Because the start of the shell session may not have been recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

#### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

#### program name = 'string'

The name of the login program.

#### errno = number (X'hexnum')

The errno value that is returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

#### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

#### System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS C/C++ Runtime</u> Library Reference and z/OS UNIX System Services Programming: Assembler Callable Services Reference.

Make sure that the /etc directory exists and that /etc/utmpx exists and has the proper permissions. Make sure that the login program (named in the error message) has the SETUID flag set in its directory entry.

#### User response

Provide the system programmer with this message number and any variable information displayed in the message.

**FSUM1101** 

Usage: uconvdef -f source\_file -v uconv\_table

### **Explanation**

The uconvdef command was not entered correctly. Processing terminates.

None

#### **User response**

Refer to uconvdef - Create binary conversion tables in z/OS UNIX System Services Command Reference for the uconvdef syntax and reissue the command.

**FSUM1102** 

uconvdef: Start processing the source file is 'string'.

# **Explanation**

Informational message that the processing of the specified input file by uconvdef started.

## **System programmer response**

None

## **User response**

None

**FSUM1103** 

uconvdef: string created.

# **Explanation**

Informational message that uconvdef completed and that output is contained in the file specified.

# System programmer response

None

#### **User response**

None

**FSUM1104** 

uconvdef: Output file 'string' was not created.

# **Explanation**

Informational message that there is no uconvdef output. This message is accompanied by another message that gives more specific information why processing did not complete.

### System programmer response

Use information in the accompanying message to determine and fix the source of the failure.

### **User response**

Use information in the accompanying message to determine and fix the source of the failure or contact the system programmer.

**FSUM1105** 

uconvdef: Not enough space for allocation.

### **Explanation**

The uconvdef function issued a system function call to obtain working storage in which to build output. The function failed and storage was not obtained. The uconvdef process terminates with no output.

Determine why the malloc() function failed.

#### User response

Contact the system programmer.

**FSUM1106** 

uconvdef: Cannot open input file 'string': errno\_msg.

# **Explanation**

The fopen() function failed. The file name and errno message associated with the fopen() are in the message. The uconvdef process terminates with no output.

# System programmer response

Determine why the fopen() function failed.

#### **User response**

Contact the system programmer.

**FSUM1107** 

uconvdef: Cannot open temporary file: errno\_msg.

# **Explanation**

The fopen() function failed. The errno message associated with the fopen() is in the message. The uconvdef process terminates with no output. Had processing been successful the temporary file would contain the uconvdef output. Then the file would be renamed to the output file name specified on the uconvdef command.

# System programmer response

Determine why the fopen() function failed.

#### User response

Contact the system programmer.

**FSUM1108** 

uconvdef: Cannot close input file 'string': errno\_msg.

## **Explanation**

The fclose() function failed. The file name and errno message associated with the fclose() are in the message. The uconvdef process continues.

## System programmer response

Determine why the fclose() function failed.

#### User response

Contact the system programmer.

FSUM1109

uconvdef: Cannot close temporary file: errno\_msg.

The fclose() function failed. The errno message associated with the fclose() is in the message. The uconvdef process terminates. The temporary file contains incomplete output and is not usable. The uconvdef process terminates with no output.

# System programmer response

Determine why the fclose() function failed.

#### **User response**

Contact the system programmer.

**FSUM1110** 

uconvdef: Cannot rename temporary file to output file 'string': errno\_msg.

## **Explanation**

The rename() function failed. The new file name and errno message associated with the rename() are in the message. The temporary file contains complete output and is usable. The temporary file name is the output file name specified as a parameter on the command.uconvdef.tmpXXXXX, where XXXXX is a random number. The uconvdef process terminates.

## System programmer response

Determine why the rename() function failed.

## **User response**

Contact the system programmer.

**FSUM1111** 

uconvdef: Error while reading input file 'string': errno\_msg.

#### **Explanation**

The fgets() function failed. The file name and errno message associated with the failure are in the message. The uconvdef process terminates with no output.

### System programmer response

Determine why the function failed.

#### **User response**

Contact the system programmer.

**FSUM1112** 

uconvdef: Error while writing temporary file: errno\_msg.

# **Explanation**

The fwrite() function failed. The errno message associated with the failure is in the message. The uconvdef process terminates with no output.

### System programmer response

Determine why the function failed.

# **User response**

Contact the system programmer.

**FSUM1113** 

uconvdef: 'MB\_CUR\_MIN' is greater than 'MB\_CUR\_MAX' default.

# **Explanation**

A value of MB\_CUR\_MIN was specified in the input file, MB\_CUR\_MAX was not specified. The default value of MB\_CUR\_MAX is 1 and the specified value of MB\_CUR\_MIN cannot exceed this value. The uconvdef process terminates with no output.

#### System programmer response

None.

## **User response**

Specify a value of MB\_CUR\_MIN that is less than MB\_CUR\_MAX in the input file and run uconvdef again with the changed input.

**FSUM1114** 

uconvdef: Line *number*: space at the line top is not allowed.

### **Explanation**

A line may not begin with a space. The number of the line is contained in the message. The uconvdef process terminates with no output.

## System programmer response

None.

### **User response**

Remove the space in the input file and run uconvdef again with the changed input.

**FSUM1115** 

uconvdef: Line number: illegal line format.

### **Explanation**

The number of the line with the illegal format is contained in the message. The uconvdef process terminates with no output.

#### System programmer response

None.

### User response

Correct the line format in the input file and run uconvdef again with the changed input.

**FSUM1116** 

uconvdef: Line number: illegal token.

### **Explanation**

The number of the line with the illegal token is contained in the message. The uconvdef process terminates with no output.

None.

## **User response**

Correct the line in the input file and run uconvdef again with the changed input.

**FSUM1117** 

uconvdef: Line number: illegal value for token 'string'.

# **Explanation**

The number of the line with the illegal token value is contained in the message. The uconvdef process terminates with no output.

# System programmer response

None.

## **User response**

Correct the line in the input file and run uconvdef again with the changed input.

**FSUM1118** 

uconvdef: Line number: token 'string' must have value.

# **Explanation**

A token must contain a value. The number of the line and token without a value is contained in the message. The uconvdef process terminates with no output.

# System programmer response

None.

#### **User response**

Correct the line in the input file and run uconvdef again with the changed input.

**FSUM1119** 

uconvdef: Line number: code set name can be defined only once.

# **Explanation**

A code set name may be defined once. The number of the line that contains the name of the code set being defined again is contained in the message. The uconvdef process terminates with no output.

### System programmer response

None.

### **User response**

Correct the line in the input file and run uconvdef again with the changed input.

**FSUM1120** 

uconvdef: Line number: 'UCONV\_CLASS' can be defined only once.

### **Explanation**

UCONV\_CLASS may be defined once. The number of the line that attempts to define UCONV\_CLASS again is contained in the message. The uconvdef process terminates with no output.

None.

## **User response**

Correct the line in the input file and run uconvdef again with the changed input.

**FSUM1121** 

uconvdef: Line number: CHARMAP section is already started.

## **Explanation**

An input file may contain only one CHARMAP section. The number of the line that attempts to begin a second section is contained in the message. The uconvdef process terminates with no output.

# System programmer response

None.

## **User response**

Correct the line in the input file and run uconvdef again with the changed input.

**FSUM1122** 

uconvdef: Line number: extra characters.

# **Explanation**

Failed to find a token on input line contained in message. The uconvdef process terminates with no output.

## System programmer response

None.

#### **User response**

Correct the line in the input file and run uconvdef again with the changed input.

**FSUM1123** 

uconvdef: Line number: conflict with 'UCONV CLASS'.

# **Explanation**

Conflict with the UCONV\_CLASS specified. The length of the code point is greater or smaller that the length allowed by the UCONV\_CLASS. The uconvdef process terminates with no output.

#### System programmer response

None.

#### User response

Correct the line in the input file and run uconvdef again with the changed input.

**FSUM1124** 

uconvdef: Line number: conflict with 'MB\_CUR\_MIN' or 'MB\_CUR\_MAX'.

# **Explanation**

The length of a code point cannot be less than MB\_CUR\_MIN or greater than MB\_CUR\_MAX. The error was detected in the line contained in the message. The uconvdef process terminates with no output.

None.

## **User response**

Correct the line in the input file and run uconvdef again with the changed input.

**FSUM1125** 

uconvdef: Line number: conflicting code length.

# **Explanation**

An invalid code point length was detected while processing a multi-byte character set. The error was detected in the line contained in the message. The uconvdef process terminates with no output.

# System programmer response

None.

# **User response**

Correct the line in the input file and run uconvdef again with the changed input.

**FSUM1126** 

uconvdef: Line number: range exceeds limits of one byte.

# **Explanation**

Range exceeds the allowable limit of one byte. The uconvdef process terminates with no output.

# System programmer response

None.

#### **User response**

Correct the line in the input file and run uconvdef again with the changed input.

FSUM1127

uconvdef: Line *number*: Too many planes.

## **Explanation**

The value of the code point is greater than allowed. The uconvdef process terminates with no output.

#### **System programmer response**

None.

#### User response

Correct the line in the input file and run uconvdef again with the changed input.

**FSUM1128** 

uconvdef: Line *number*: escape and comment characters must be distinct.

# **Explanation**

The escape and comment characters must be distinct. The error was detected in the line contained in the message. The uconvdef process terminates with no output.

None.

#### **User response**

Make the escape and comment characters distinct in the input file and run uconvdef again with the changed input.

**FSUM1129** 

uconvdef: No code set name is defined.

## **Explanation**

The input file must contain a statement that identifies the code set. The uconvdef process terminates with no output.

### System programmer response

None.

### **User response**

Add a code set name statement to the input file and run uconvdef again with the changed input. For example: <code\_set\_name> "IBM-1047"

FSUM1130

uconvdef: No 'UCONV\_CLASS' is defined.

## **Explanation**

The input file must contain a statement that identifies the UCONV\_CLASS. The uconvdef process terminates with no output.

### System programmer response

None.

# **User response**

Add a UCONV\_CLASS statement to the input file and run uconvdef again with the changed input. For example: <uconv\_class> "SBCS"

**FSUM1131** 

uconvdef: CHARMAP section must start with 'CHARMAP'.

# **Explanation**

The CHARMAP section of the input file must start with a CHARMAP statement. The uconvdef process terminates with no output.

### System programmer response

None.

#### **User response**

Add a CHARMAP statement to the input file and run uconvdef again with the changed input.

**FSUM1132** 

uconvdef: CHARMAP section has no 'END CHARMAP'.

The input file must contain an END CHARMAP statement. The uconvdef process terminates with no output.

## **System programmer response**

None.

## **User response**

Add an END CHARMAP statement to the input file and run uconvdef again with the changed input.

**FSUM1133** 

uconvdef: Cannot open output file 'string': errno\_msg.

# **Explanation**

The fopen() function failed. The file name and errno message associated with the fopen() are in the message. The uconvdef process terminates with no output.

# System programmer response

Determine why the function failed.

# **User response**

Contact the system programmer.

**FSUM1134** 

uconvdef: Cannot close output file: errno\_msg.

# **Explanation**

The fclose() function failed. The errno message is in the message. The uconvdef process terminates with no output.

#### System programmer response

Determine why the function failed.

#### **User response**

Contact the system programmer.

**FSUM1135** 

uconvdef: Cannot reopen output file: errno\_msg.

## **Explanation**

The freopen() function failed. The errno message is in the message. The uconvdef process terminates with no output.

# System programmer response

Determine why the function failed.

#### **User response**

Contact the system programmer.

**FSUM1136** 

uconvdef: Cannot reposition output file: errno\_msg.

The fseek() function failed while repositioning the file pointer before a write to the output file. The errno message is in the message. The uconvdef process terminates with no output.

## System programmer response

Determine why the function failed.

### **User response**

Contact the system programmer.

**FSUM1137** 

uconvdef: Error while writing output file: errno\_msg.

# **Explanation**

The fwrite() function failed while writing to the output file. The errno message is in the message. The uconvdef process terminates with no output.

## System programmer response

Determine why the function failed.

# **User response**

Contact the system programmer.

**FSUM1201** 

Cannot create string

# **Explanation**

A problem occurred while the UNIX datagram socket was being created or initialized. This message is generated if one or more of the following events occurred:

#### socket()

The socket function could not create a UNIX datagram socket.

#### bind()

The bind function could not bind a local name to the UNIX socket descriptor.

#### chmod()

The chmod function could not change the permissions on the log file.

Processing ends. The name of the log file and the return code information is appended to the error message.

**Note:** Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.

### System programmer response

Use the return code information to determine the cause of the failure.

#### **User response**

Contact the system programmer.

**FSUM1202** 

syslog/udp: unknown service

The syslog service for UDP was not found in /etc/services. Processing continues by using a default UDP port of 514.

**Note:** Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.

# **System action**

Processing continues by using the default port.

## **Operator response**

Contact the system programmer and provide this message.

# System programmer response

If you do not want to exchange log data with remote UDP syslogd servers, no action is required.

Otherwise, determine whether the default port is the correct port to use for receiving log data from remote UDP syslogd clients. The default port is also used to send log data to UDP syslogd servers when a syslogd configuration rule does not specify the port using the -A forwarding action.

When receiving log data from remote UDP syslogd clients, include the syslog service by using the UDP protocol in the /etc/services file or the hlq.ETC.SERVICES data set. You should also use the PORT statement in the TCP/IP profile to reserve the port for use by syslogd.

When sending log data to a remote UDP syslogd server, you can use the -A forwarding action and specify the server's port.

# **User response**

No action is needed.

#### **Problem determination**

See the System Programmer Response.

#### **Source**

z/OS Communications Server TCP/IP: syslogd

#### Module

syslogd.c

## **Routing code**

Not applicable.

### **Descriptor code**

Not applicable.

#### Automation

Not applicable for automation

## **Example**

FSUM1202 syslog/udp: unknown service

#### FSUM1203

bind: error\_description Errno/Rsn=errno/reason\_code

## **Explanation**

The bind function for the UDP AF\_INET or AF\_INET6 socket that is used to send log data to and receive log data from remote syslogd servers failed.

In the message text:

#### error\_description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, "Return codes (errnos)," on page 939 in z/OS UNIX System Services Messages and Codes.

#### reason\_code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed..

**Note:** This error can occur before syslogd processed the syslog configuration file. In that case, this message appears at the operator console.

# **System action**

The socket is closed and processing continues. syslogd will not attempt to send log data to or receive log data from remote syslogd servers by using UDP. An attempt will be made every 30 seconds to reopen the socket and reissue the bind() call.

# **Operator response**

If a subsequent bind() call is successful, no action is needed. If the bind() call continues to fail, save the system log and the log file where this message is written and contact the system programmer.

## System programmer response

Verify that the UDP port used for the syslog service is defined in the /etc/services file or the hlq.ETC.SERVICES data set. The port should also be reserved on the PORT statement in the TCP/IP profile for use by syslogd. See Configuring the syslog daemon, Considerations when receiving messages using UDP in z/OS Communications Server: IP Configuration Guide.

#### User response

No action is needed.

#### **Problem determination**

See the System programmer response.

#### Source

z/OS Communications Server TCP/IP: syslogd

#### Module

syslogd.c

## **Example**

FSUM1203 bind: EDC8115I Address already in use. Errno/Rsn=1115/74637232

FSUM1204

select: error\_description Errno/Rsn=errno/reason\_code

## **Explanation**

select() failed while monitoring one or more of the following sockets: AF\_UNIX, AF\_INET or AF\_INET6. The AF\_INET or AF\_INET6 socket can be a UDP socket used for sending and receiving log data over the network. Or it can be a TCP listening socket used to receive clear-text or TLS-protected log data over the network that uses TCP.

In the message text:

#### error\_description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, "Return codes (errnos)," on page 939 in z/OS UNIX System Services Messages and Codes.

#### reason\_code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed..

### System action

Syslogd processing ends if the failure is for the AF\_UNIX socket. Otherwise, processing continues. If the failure is for an AF\_INET or AF\_INET6 socket and the return code is EIO (122), indicating that TCP/IP has been recycled, the AF\_INET or AF\_INET6 sockets will be closed and reopened.

Any other error on one of the AF\_INET or AF\_INET6 sockets will not be recovered. The socket is closed. For an error on the UDP socket, message FSUM1205 will be issued after message FSUM1204. For an error on a TCP listening socket, message FSUM1282 will be issued after message FSUM1204.

## **Operator response**

Save the system log and the log file where this message is written and contact the system programmer.

#### System programmer response

Use the return code information to determine the cause of the select() failure.

#### **User response**

No action is needed.

#### **Problem determination**

See the System programmer response.

#### Source

z/OS Communications Server TCP/IP: syslogd

#### Module

syslogd.c

# **Routing code**

Not applicable.

# **Descriptor code**

Not applicable.

### **Automation**

Not applicable for automation

#### **FSUM1205**

An error was detected on the AF\_INET socket, syslogd will no longer monitor the socket

### **Explanation**

This message is generated after a nonrecoverable socket error. The return code information is available in the preceding message. This message is for informational purposes only.

#### System programmer response

None.

#### User response

None.

#### FSUM1206

socket: error\_description Errno/Rsn=errno/reason\_code

# **Explanation**

The socket function for the UDP AF\_INET or AF\_INET6 socket that is used to send log data to and receive log data from remote syslogd servers failed.

In the message text:

#### error description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, "Return codes (errnos)," on page 939 in z/OS UNIX System Services Messages and Codes.

#### reason\_code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed..

**Note:** This error can occur before syslogd processed the syslog configuration file. In that case, this message appears at the operator console.

# System action

Processing continues. syslogd will not attempt to send log data to or receive log data from remote syslogd servers by using UDP. An attempt will be made every 30 seconds to open the socket.

# **Operator response**

If subsequent socket() call is successful, no action is needed. If the socket() call continues to fail, save the system log and the log file where this message is written and contact the system programmer.

## System programmer response

Use the return code information to determine why the socket() function failed.

## **User response**

No action is needed.

#### **Problem determination**

See the System programmer response.

#### **Source**

z/OS Communications Server TCP/IP: syslogd

#### Module

syslogd.c

### **Routing code**

Not applicable.

# **Descriptor code**

Not applicable.

### **Automation**

Not applicable for automation

#### Example

FSUM1206 socket: EDC5112I Resource temporarily unavailable. Errno/Rsn=112/12CA00B6

# **FSUM1207**

recvmsg unix string

# **Explanation**

An error occurred while performing a recvmsg() of a UNIX message. The return code information is appended to the error message.

#### System programmer response

Use the return code information to determine why the recvmsg() function failed.

#### **FSUM** messages

### **User response**

Contact the system programmer.

**FSUM1208** 

\_\_atoe string

# **Explanation**

An error occurred while translating an internet message from ASCII to EBCDIC. The return code information is appended to the error message.

# System programmer response

Use the return code information to determine the cause of the \_\_atoe() failure.

# User response

Contact the system programmer.

**FSUM1209** 

recvfrom inet string

## **Explanation**

An error occurred while performing a recvfrom() of an internet message. The return code information is appended to the error message. If the return code is EIO indicating that TCP/IP has been recycled, the AF\_INET or AF\_INET6 socket will be closed and re-opened.

## System programmer response

For errors other than EIO, use the return code information to determine why the recvfrom() function failed.

### **User response**

Contact the system programmer.

**FSUM1210** 

etoa *string* 

#### **Explanation**

An error occurred while translating a message from EBCDIC to ASCII. The return code information is appended to the error message.

### System programmer response

Use the return code information to determine the cause of the \_\_etoa() failure.

#### **User response**

Contact the system programmer.

**FSUM1211** 

sendto (destination): error\_description Errno/Rsn=errno/reason\_code

### **Explanation**

- An error occurred while performing a sendto() of log data to a remote syslogd server by using UDP. syslogd stops sending log data to the destination.
- In the message text:

#### destination

The UDP output destination to which the sendto failed. This is an IP address, or a hostname based on the configured destination.

#### error\_description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, "Return codes (errnos)," on page 939 in z/OS UNIX System Services Messages and Codes.

#### reason\_code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed..

# **System action**

Processing continues.

# **Operator response**

Save the system log and the log file where this message is written and contact the system programmer.

## System programmer response

Use the return code information to determine the cause of the sendto() failure. Review the log file for additional syslogd error messages that indicate the action taken based on the type of sendto() failure.

# **User response**

No action is needed.

#### **Problem determination**

See the System programmer response.

#### Source

z/OS Communications Server TCP/IP: syslogd

### **Module**

syslogd.c

#### **Routing code**

Not applicable.

### **Descriptor code**

Not applicable.

#### **Automation**

Not applicable for automation

# **Example**

FSUM1211 sendto (192.168.2.1): EDC8130I Host cannot be reached. Errno/Rsn=1130/74620291

#### **FSUM1212**

#### unknown priority name priority

# **Explanation**

A priority name found in the configuration file is not valid.

**Note:** Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.

## System programmer response

Check the configuration file.

# **User response**

Contact the system programmer.

#### **FSUM1213**

#### unknown facility name facility

# **Explanation**

A facility name found in the configuration file is not valid.

**Note:** Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.

# System programmer response

Check the configuration file.

#### **User response**

Contact the system programmer.

#### **FSUM1214**

#### getaddrinfo string

# **Explanation**

A host name found in the configuration file is not valid. The return code information is appended to the error message.

**Note:** Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.

# System programmer response

Check the configuration file.

#### User response

Contact the system programmer.

#### **FSUM1215**

sigaction string

sigaction() failed while working with the SIGHUP signal. syslogd was trying to start a new session with no controlling terminal. The return code information is appended to the error message.

**Note:** Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.

# System programmer response

Use the return code information to determine the cause of the sigaction() failure.

### **User response**

Contact the system programmer.

**FSUM1216** 

fork string

# **Explanation**

fork() could not create a child process. The return code information is appended to the error message.

**Note:** Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.

## System programmer response

Use the return code information to determine the cause of the fork() failure.

**FSUM1217** 

setsid string

# **Explanation**

setsid() failed to create a new process group. syslogd was trying to start a new session with no controlling terminal. The return code information is appended to the error message.

**Note:** Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console.

### System programmer response

Use the return code information to determine the cause of the setsid() failure.

#### **User response**

Contact the system programmer.

**FSUM1218** 

Message from syslog@hostname at timestamp

### **Explanation**

This message line precedes the syslogd message line for messages that are displayed to all logged-in users in the OMVS shell. It identifies the host that originated the message and provides the timestamp for the message.

#### System programmer response

None.

#### **User response**

None.

#### **FSUM1219**

### syslogd: exiting on signal n

# **Explanation**

syslogd has received the displayed signal and is ending. Normally, the displayed signal will be 15 (SIGTERM) indicating that a kill command has been issued for syslogd.

# System programmer response

None.

## **User response**

None.

**FSUM1220** 

syslogd: restart

## **Explanation**

This message is written to log files each time syslogd is started.

# System programmer response

None.

### **User response**

None.

**FSUM1221** 

syslogd: last message repeated n times

# **Explanation**

The number of the times the previous message has been issued consecutively. A large number might indicate a loop in the application generating the message.

# System programmer response

Investigate the application generating the messages.

#### **User response**

Contact the system programmer.

**FSUM1222** 

setsockopt sockopt for protocol port portnum: error\_description Errno/Rsn=errno/reason code

# **Explanation**

An error occurred while syslogd was attempting to set a socket option for an AF\_INET or AF\_INET6 socket.

In the message text:

#### sockopt

The socket option for which the setsockopt() failed. The field has one of the following values:

SO\_REUSEADDR – A setsockopt() with option SO\_REUSEADDR failed for either a UDP syslogd socket
or a TCP syslogd listening socket. The failure occurred when syslogd was setting up the socket. The
SO\_REUSEADDR socket option is used to ensure that syslogd is able to bind to the configured UDP or TCP
listening port even on a restart.

• SO\_RCVTIMEO – A setsockopt() with option SO\_RCVTIMEO failed for a TCP syslogd listening socket. The failure occurred when syslogd was setting up the socket. The SO\_RCVTIMEO socket option is used to set an inactivity timeout for TCP connections to remote syslogd clients.

### protocol

This field has one of the following values:

- TCP The setsockopt() failed for a TCP socket that is configured for clear-text or TLS-protected log data.
- UDP The setsockopt() failed for the UDP socket that is used to send and receive log data by using UDP.

#### portnum

When protocol is UDP, this is the port number of the local UDP syslogd socket.

When protocol is TCP, this is the port number of the local listening socket for which the setsockopt() failed.

#### error description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, "Return codes (errnos)," on page 939 in z/OS UNIX System Services Messages and Codes.

#### reason\_code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed..

**Note:** This error can occur before syslogd processes the syslog configuration file. In that case, this message appears at the operator console.

# **System action**

The socket is closed, and processing continues.

For a failure on the UDP syslogd socket, syslogd will not attempt to send log data to or receive log data from remote syslogd servers by using UDP. For a failure on a TCP syslogd listening socket, syslogd will not accept connections from remote syslogd clients. In both cases, an attempt will be made every 30 seconds to reopen the socket.

## **Operator response**

If subsequent setsockopt() calls are successful, no action is needed. If the setsockopt() call continues to fail, save the system log and the log file where this message is written and contact the system programmer.

### **System programmer response**

Use the return code information to determine why the setsockopt() function failed.

#### User response

No action is needed.

#### Problem determination

See the System programmer response.

#### Source

z/OS Communications Server TCP/IP: syslogd

# **Example**

FSUM1222 setsockopt SO\_REUSEADDR for UDP port 514: EDC5113I Bad file descriptor. Errno/Rsn=113/1110011C

FSUM1222 setsockopt SO\_RCVTIMEO for TCP port 6514: EDC5118I Incorrect address. Errno/Rsn=118/0F02012E

#### **FSUM1223**

Error return-code/reason-code was returned from libcall: explanation

# **Explanation**

The specified library or system call failed.

libcall is the name of the library or system call.

explanation describes the nature of the error.

return-code is the return code in hexadecimal format.

reason-code is the reason code in hexadecimal format.

# **System action**

Processing continues.

# System programmer response

Use the return-code and reason-code information to determine why the library or system call failed.

#### **User response**

See z/OS C/C++ Runtime Library Reference for more information about libcall.

See z/OS UNIX System Services Messages and Codes for more information about return-code and reason-code.

#### **FSUM1224**

#### SMF interface disabled — reason

# **Explanation**

An error writing to SMF. syslogd will not attempt to write to SMF again until it reinitializes.

reason describes the nature of the error:

record type 109 not recorded. Record type 109 is used to store syslog messages in SMF. SMF can be configured to ignore records of this type. When these records are ignored, syslogd will not attempt to store them.

syslogd *not permitted to BPX.SMF*. The userid associated with syslogd must be permitted to SAF resource BPX.SMF. See *z/OS UNIX System Services Planning* for more information.

*unexpected error*. Another type of error was reported by SMF. See message FSUM1223 for more information about the error.

# System action

Processing continues, but no records will be written to SMF.

## System programmer response

Resolve the problem and reinitialize syslogd by sending it the SIGHUP signal.

#### **User response**

None.

#### **FSUM1225**

#### syslogd record not written to SMF - reason

## **Explanation**

A transient error occurred writing to SMF. The record being written is lost.

reason describes the nature of the error:

SMF not active. SMF is not active.

SMF buffer shortage. SMF encountered a buffer shortage.

# System action

Processing continues. Subsequent errors of the same type will not be reported.

### System programmer response

Resolve the problem and reinitialize syslogd by sending it the SIGHUP signal.

#### **User response**

None.

### **FSUM1226**

#### Syntax error at line linenum in filename

## **Explanation**

An invalid statement was encountered while parsing the syslog configuration file. *linenum* is the line or record number in the syslogd configuration file where the syntax error was found. *filename* is the name of the syslog configuration file.

### **System action**

syslogd ignores this line and continues.

#### **Operator response**

Save the system log and contact the system programmer.

Correct the invalid statement and force syslogd to reprocess the configuration file by issuing the MODIFY SYSLOGD, RESTART command or sending syslogd the SIGHUP signal to cause it to reinitialize. If more information about the syntax error is needed, start syslogd with the -d command-line parameter and look at the debug messages which are displayed.

# **User response**

No action is needed.

#### **Problem determination**

See the System programmer response.

#### Source

z/OS Communications Server TCP/IP: syslogd

#### Module

syslogd.c

# **Routing code**

Not applicable.

# **Descriptor code**

Not applicable.

#### **Automation**

Not applicable for automation

#### Example

FSUM1226 Syntax error at line 15 in /etc/syslog.conf

#### **FSUM1227**

#### Configuration file filename could not be read

### **Explanation**

An error occurred opening or reading the specified configuration file. See message FSUM1223 for more information about the error. *filename* is the name of the configuration file specified on the syslogd command-line or the default configuration file /etc/syslog.conf.

# **System action**

syslogd ends.

### System programmer response

Resolve the problem and start syslogd.

#### User response

None.

#### **FSUM1228**

#### Open of log file filename did not complete

# **Explanation**

An open () call for the specified file did not complete. It may be a named pipe with no program currently reading from it. *filename* is the name of a log file specified in the configuration file.

# **System action**

syslogd disables the rule using filename and continues.

## System programmer response

Resolve the problem and reinitialize syslogd by issuing the MODIFY SYSLOGD, RESTART command or sending it the SIGHUP signal.

## **User response**

None.

#### **FSUM1229**

#### syslogd is already active

## **Explanation**

- This message indicates that one of the following has been detected:
  - Another instance of syslogd, or possibly some other program, is already processing the syslogd AF\_UNIX socket. The syslogd AF\_UNIX socket is /dev/log, or a different one specified with environment variable SYSLOGD\_PATH\_NAME or the -p command-line parameter. This is checked when you are starting syslogd in local-only mode (-i start option) or normal mode (no -i or -n start option).
  - Another instance of syslogd is already processing data that is received over the network. This is checked when you are starting syslogd in network-only mode (-n start option) or normal mode (no -i or -n start option).

Only one instance of syslogd can process local messages that are received over AF\_UNIX and only one instance of syslogd can process log data that is received over the network. A single instance of syslogd can be started to receive both local and network messages. This is known as normal mode. Or two instances of syslogd can be started with one receiving local messages (local-only mode) and the other receiving messages over the network (network-only mode).

**Note:** This error appears on the operator console because it occurs before syslogd has processed the syslog configuration file.

# System action

syslogd ends.

### **Operator response**

If the instance of syslogd that you tried to start is already active, no action is needed. If you have changed the syslogd configuration file, you can use the MODIFY SYSLOGD, RESTART command or the SIGHUP signal to cause syslogd to reprocess the configuration file.

If you tried to start a second instance of syslogd and it is failing, save the system log and contact the system programmer.

### System programmer response

Review the support of normal, local-only, and network-only mode for syslogd in *Starting and stopping syslogd* in *z/OS Communications Server: IP Configuration Guide*.

#### **FSUM** messages

- If the first instance of syslogd was started in normal mode (no -i or -n start option), a second instance is not supported.
- If the first instance of syslogd was started in local-only mode (-i start option), a second instance is only allowed in network-only mode (-n start option).
- If the first instance of syslogd was started in network-only mode (-n start option), a second instance is only allowed in local-only mode (-i start option).

Having more than one instance of syslogd to support receiving network traffic over different ports is not supported. For example, starting one instance of syslogd to receive traffic over UDP (-U) and another instance of syslogd to receive traffic over TLS-protected TCP (-S) is not supported.

## **User response**

No action is needed.

### **Problem determination**

See the System programmer response.

#### **Source**

z/OS Communications Server TCP/IP: syslogd

#### Module

syslogd.c

# **Routing code**

Not applicable.

## **Descriptor code**

Not applicable.

#### **Automation**

Not applicable for automation

#### **Example**

FSUM1229 syslogd is already active

#### FSUM1230

## Log file filename was created

# **Explanation**

filename is the name of a log file specified in the syslog configuration file, after the expansion of strftime() format strings. syslogd created the file because it did not already exist and either it contained a strftime() format string or the -c command-line parameter was specified. The directory containing the log file may also have been created if the -c command-line parameter was specified.

# System action

syslogd continues.

None.

#### **User response**

None.

**FSUM1231** 

syslogd configuration error

# **Explanation**

The syslog configuration file specified an IPv6 address (or a host name that resolved to an IPv6 address) for messages to be forwarded to but the TCP/IP stack is not IPv6-enabled.

# **System action**

The rule is disabled and processing continues.

# System programmer response

Correct configuration error.

# **User response**

None.

**FSUM1232** 

syslogd: running non-swappable

# **Explanation**

This message is issued to the syslog file when syslogd is able to run non-swappable.

### **System action**

syslogd continues.

# System programmer response

None.

#### **User response**

None.

**FSUM1233** 

syslogd: running swappable

### **Explanation**

This message is issued to the syslog file when syslogd is unable to run non-swappable. The return code information is appended to the error message.

# **System action**

syslogd continues.

# System programmer response

If you want syslogd to run as non-swappable, do one of the following:

#### **FSUM** messages

- Do not define the RACF facility, "BPX.STOR.SWAP" and start the syslog daemon from a userid with UID=0.
- Define the facility and give the appropriate userids at least READ access to the facility.

#### **User response**

None.

#### **FSUM1234**

#### syslogd record not written to OPERLOG - OPERLOG not active

# **Explanation**

syslogd attempted to write a log message to the /dev/operlog destination. The write failed with a return code that indicates OPERLOG is not active.

# **System action**

Processing continues. All syslogd log messages that would have been written to the OPERLOG are discarded until the OPERLOG is activated.

## **Operator response**

If you want syslogd message logging to OPERLOG, start the MVS<sup> $^{\text{M}}$ </sup> operations log (OPERLOG). See  $\underline{z/OS}$   $\underline{MVS}$  Setting Up a Sysplex. If you do not want syslogd message logging to the OPERLOG, notify the system programmer.

# System programmer response

If you want syslogd message logging to OPERLOG, modify the syslog configuration file so that syslogd does not write to the /dev/operlog destination and send syslogd the SIGHUP signal to cause it to reinitialize. See <u>z/OS</u> Communications Server: IP Configuration Guide, Configuring the syslog daemon (syslogd).

#### **FSUM1240**

Hostname name could not be resolved: string

## **Explanation**

A syslog configuration statement specified a hostname that could not be resolved to an IP address.

#### name

The hostname that could not be resolved to an IP address.

#### string

The text that describes the problem.

## System action

The syslog configuration statement that references hostname, *name*, is disabled and processing continues. Periodically, syslogd will retry hostname resolution and if the retry is successful then message FSUM1241 will be issued.

## **Operator response**

If the syslog configuration file has not been changed and this hostname was previously resolved successfully, this might indicate a problem with the system resolver or a local or remote domain name server. If the syslog configuration file was recently changed, contact the system programmer.

## System programmer response

Verify that the hostname, *name*, is a valid hostname and is known to the system resolver or domain name system. If the hostname is no longer valid, the syslog configuration file should be modified to remove or correct the configuration statement containing the hostname. If the hostname is valid, refer to z/OS Communications Server Diagnosis Guide, Diagnosing resolver problems.

## **FSUM1242**

#### Incorrect IPv6 address type was specified

# **Explanation**

syslogd encountered an incorrect IPv6 address type during the processing of its configuration file. Use valid global IPv6 addresses in syslog configuration files.

# **System action**

The syslogd configuration statement containing the incorrect IPv6 address is ignored. Processing continues.

# **Operator response**

Contact the system programmer to have the syslog configuration file corrected.

# System programmer response

Correct the syslog configuration file. Consider using a hostname rather than a hard-coded IPv6 address.

#### Incorrect value for parmname parameter

## **Explanation**

An incorrect value has been specified for a syslogd parameter.

#### parmname

Is the configuration parameter or start option name that is in error.

## **System action**

If this message is issued as a result of an incorrect start option value, syslogd ends. If this message is issued as a result of an incorrect parameter value in a syslogd rule or other configuration statement, the rule is disabled or the statement is ignored and processing continues.

## **Operator response**

None.

## System programmer response

Examine the JCL, script or command that was used to start syslogd. The parameter shown in the message is incorrect. If the message is issued as a result of an error in the syslog configuration file, examine the configuration file and correct the error. See z/OS Communications Server: IP Configuration Guide Chapter 5 for information on how to specify the parameter or start option.

## Pipe pipename has been closed

## **Explanation**

There was a timeout writing to the pipe because the pipe was blocked for more than 2 seconds. The pipe has been closed and the syslogd rule with this pipe as its destination has been disabled.

## pipename

Is the name of the pipe that has been closed.

# System action

syslogd continues to run but will no longer attempt to write log messages to the pipe.

## **Operator response**

Check the application that reads the pipe to be sure it is running. If it is not running, it may need to be restarted. After restarting the application, restart syslogd to resume logging to the pipe.

# System programmer response

Check the reading application to be sure it is running with the proper amount of CPU resource. It may need more CPU time to be able to keep up with the amount of data being written to the pipe by syslogd. Make the necessary adjustments and restart syslogd to resume logging.

# **User response**

Not applicable.

# **Problem determination**

See System Programmer Response.

## Module

syslogd.c

#### **Automation**

This message is written to the system console and syslog. You might want to automate on this message to determine when syslogd is able to process requests to log messages.

## **FSUM1249**

#### jobname SHUTDOWN COMPLETE

## **Explanation**

The syslogd application ended in response to a STOP command or a terminating signal, or because of an unrecoverable error. In the message text:

#### jobname

The job name of the syslogd application.

## **System action**

Syslogd ends.

#### **Operator response**

If you did not intentionally stop the syslogd application, contact the system programmer and restart the syslogd application when the problem has been resolved.

## System programmer response

If the syslogd application ended because of an unrecoverable error, examine the syslogd destination that is configured to receive error messages for the daemon facility to determine the cause of the problem. To determine which syslogd destination contains these messages, look for a rule in the syslogd configuration file similar to the following: daemon.error destination. Because of the flexibility of syslogd rules, the rule

you configured for these messages might look different. See the topic on the syslogd daemon in the z/OS Communications Server: IP Configuration Reference documentation for the syntax of syslogd rules.

#### FSUM1253

jobname MODIFY COMMAND UNSUCCESSFUL - SYNTAX ERROR, reason

## **Explanation**

An incorrect parameter was specified on a syslogd MODIFY command. In the message text:

#### jobname

The job name of the syslogd application.

#### reason

A description of the type of error that occurred. The following values are possible:

#### **UNKNOWN VERB**

The command verb is not known. For example:

MODIFY procname, BADVERB

#### **UNKNOWN KEYWORD**

An unknown keyword was specified. For example:

MODIFY procname, DISPLAY, BADKEY

## **MISSING KEYWORD**

A required keyword is missing. For example:

MODIFY procname, DISPLAY,

#### **MISSING VALUE**

A required value is missing. For example:

MODIFY procname, DISPLAY, ARCHIVE, DETAIL, MAX=

#### **INCORRECT VALUE**

An incorrect value was specified. For example:

#### **MISSING VERB**

The command verb is missing. For example:

MODIFY procname,

# **System action**

The syslogd MODIFY command is ignored.

# **Operator response**

Verify the syntax of the MODIFY command and reissue the command. See the topic on operator commands and system administration in the <u>z/OS Communications Server: IP System Administrator's Commands</u> documentation for the syntax of the syslogd MODIFY command.

## **FSUM1255**

File system statistics refresh failed

# **Explanation**

An error occurred while syslogd was refreshing file system statistics. Some of the activities that cause the statistics to be refreshed are: a MODIFY DISPLAY or MODIFY ARCHIVE command, a time of day or threshold based archive, or a syslogd restart. This message is preceded by one or more other error messages that provide more details about the error.

## **System action**

Syslogd processing continues but syslogd is unable to complete the activity that triggered this message. If a MODIFY command was issued, the command is ignored. If an automatic archive was attempted, the archive fails. If syslogd was restarted, the restart completes without refreshing file system statistics.

## **Operator response**

Contact the system programmer.

## System programmer response

Examine the syslogd destination that is configured to receive error messages for the daemon facility to determine if additional error messages explain more about the problem. To determine which syslogd destination contains these messages, look for a rule in the syslogd configuration file similar to the following: daemon.error destination. Because of the flexibility of syslogd rules, the rule you configured for these messages might look different. See the topic on the syslogd daemon in the *z/OS Communications Server: IP Configuration Reference* documentation for the syntax of syslogd rules. If the problem cannot be resolved with the information provided then restart syslogd with the -d start option to get additional debugging information.

**FSUM1257** 

jobname IS UNABLE TO ARCHIVE BELOW FILE SYSTEM THRESHOLD value

## **Explanation**

During an archive, syslogd was unable to reduce the utilization of one or more z/OS UNIX file systems below 50% of the value configured with the ArchiveThreshold configuration statement. One instance of message FSUM1269 should be written to the syslogd destination that is configured to receive error messages for the daemon facility for each applicable file system. In the message text:

#### jobname

The job name of the syslogd application.

#### value

50% of the value configured with the ArchiveThreshold configuration statement.

# **System action**

Syslogd processing continues.

# **Operator response**

Contact the system programmer.

## System programmer response

Issue the MODIFY procname, DISPLAY, ARCHIVE, DETAIL command to display z/OS UNIX file systems and the syslogd files contained in those file systems, in order to determine which file systems cannot be reduced below the threshold. Examine the syslogd destination that is configured to receive error messages for the daemon facility to determine if additional error messages explain more about the problem. Message FSUM1269 identifies the applicable file systems and the utilization percentage after the archive. To determine which syslogd destination contains these messages, look for a rule in the syslogd configuration file similar to the following: daemon.error destination. Because of the flexibility of syslogd rules, the rule you configured for these messages might look different. See the topic on the syslogd daemon in the z/OS Communications Server: IP Configuration Reference documentation for the syntax of syslogd rules. If the threshold value in the message text is relatively small, consider changing the value specified on the ArchiveThreshold configuration statement to a larger value. Check to make sure that other applications are not using the same file systems as syslogd. Automatic archiving based on a utilization threshold might not work correctly if non-syslogd managed data resides on the same file systems as data managed by syslogd. See the topic on operator commands and system administration in the z/OS Communications Server: IP System Administrator's Commands documentation for information about the MODIFY command for syslogd. See the topic on TCP/IP customization in the z/OS Communications Server: IP Configuration Guide documentation and the topic on the syslogd daemon in the z/OS Communications Server: IP Configuration Reference documentation for information on configuring syslogd for automatic archiving.

## **User response**

parameter specified out of context

## **Explanation**

A syslogd configuration statement or parameter is specified out of context. There are 2 possible reasons for this.

- A parameter that is valid only within the bounds of Beginxxx and Endxxx statements is specified outside those bounds. For example, the DSNPrefix parameter is specified outside of the BeginArchiveParms and EndArchiveParms statements. The parameter is ignored in this case.
- A configuration statement or parameter that is not valid within the bounds of Beginxxx and Endxxx statements is specified within those bounds. For example, the ArchiveCheckInterval configuration statement is specified inside of the BeginArchiveParms and EndArchiveParms statements. The entire Beginxxx and Endxxx statement block is treated as an error in this case.

In the message text:

## parameter

The configuration statement or parameter that was specified out of context.

## **System action**

Syslogd processing continues.

## **Operator response**

Contact the system programmer.

# System programmer response

Examine the syslogd configuration file and correct the statement or parameter that failed. See the topic on the syslogd daemon in the <u>z/OS Communications Server: IP Configuration Reference</u> documentation for the syntax of syslogd configuration statements. Restart syslogd.

The syslogd application was configured to perform automatic archiving, but the automatic archive function is not active due to a configuration error or an internal error. In the message text:

## jobname

The job name of the syslogd application.

# **System action**

Syslogd processing continues, but syslogd will not be able to automatically archive z/OS UNIX files.

## **Operator response**

Contact the system programmer.

## System programmer response

Examine the syslogd destination that is configured to receive error messages for the daemon facility to determine if additional error messages explain more about the problem. To determine which syslogd destination contains these messages, look for a rule in the syslogd configuration file similar to the following: daemon.error destination. Because of the flexibility of syslogd rules, the rule you configured for these messages might look different. See the topic on the syslogd daemon in the *z/OS Communications Server: IP Configuration Reference* documentation for the syntax of syslogd rules. Investigate and take action according to these error messages. If a configuration error occurred, correct the error and restart syslogd. If the problem cannot be resolved with the information provided then restart syslogd with the -d start option to get additional debugging information.

File system *mountpoint* actual utilization *actual* - target utilization *target* 

# **Explanation**

During an archive, syslogd was unable to reduce the utilization of a z/OS UNIX file system below 50% of the value configured with the ArchiveThreshold configuration statement. This message shows both the target percentage value (50% of the value configured with the ArchiveThreshold configuration statement), and the actual percentage value that was achieved. This message indicates the results for an individual file system, and is followed by message FSUM1257. In the message text:

## mountpoint

The mount point of the z/OS UNIX file system.

#### actual

The actual utilization percentage that was achieved.

#### target

50% of the value configured with the ArchiveThreshold configuration statement.

## **System action**

Syslogd processing continues.

## Warning: user name name is truncated to 8 characters

## **Explanation**

A rule in the syslogd configuration file appears to be configured with a list of user names as the destination, but the specified user name is too long. In the message text:

#### name

The user name specified on the rule.

# **System action**

Syslogd truncates the specified user name to 8 characters.

## **Operator response**

Contact the system programmer.

## System programmer response

Verify that the rule destination is supposed to be a list of user names. If so, specify user names that are no more than 8 characters and restart syslogd. It is possible that the destination is supposed to be a z/OS UNIX file, but the leading slash ("/") character was inadvertantly left off. In this case, syslogd interprets the destination as a list of user names. If this is the case, correct the z/OS UNIX file destination and restart syslogd.

# **User response**

Not applicable.

## **Problem determination**

See system programmer response.

## **Module**

syslogd

#### **Example**

FSUM1270 Warning: user name charliebrown is truncated to 8 characters

## **Routing code**

Not applicable.

## **Descriptor code**

### **Automation**

Not applicable.

#### **FSUM1271**

### jobname RULE ON LINE num IN filename WAS DISABLED

### **Explanation**

The syslogd rule on line number num in the syslog configuration file named filename was disabled.

#### jobname

The job name of the syslogd application.

#### num

The line or record number of the statement in the syslog configuration file.

### filename

The name of the syslog configuration file.

# **System action**

Processing continues. Log messages are no longer written to the destination file for this syslogd rule.

# **Operator response**

This informational message indicates that syslogd has stopped logging messages for the syslogd rule due to an error writing to the rule's destination file. This occurs when the filesystem for the destination file is full but can also occur for other errors. If the filesystem is full, free up space in the filesystem and issue a MODIFY RESTART command to syslogd to resume logging.

# System programmer response

This informational message indicates that syslogd has stopped logging messages for the syslogd rule due to an error writing to the rule's destination file. This occurs when the filesystem for the destination file is full but can also occur for other errors. If the file system is filling up often then you need to consider automatic syslogd archiving or you need to reduce the number of log messages being written to the filesystem or increase the size of the filesystem.

### **User response**

Not applicable.

#### **Problem determination**

See system programmer response.

#### Module

syslogd.c

#### **Automation**

This message is written to the system console and syslog. You might want to automate on this message to monitor syslogd and take appropriate action.

**FSUM1272** 

Warning: archive function disabled for rules with shared destination filename

### **Explanation**

More than one syslogd rule is using the same z/OS UNIX file destination, and at least one of those rules is configured with the -N parameter, indicating the file should be automatically archived. Automatic archiving for rules that share a z/OS UNIX file destination is not supported. In the message text:

#### filename

The name of the z/OS UNIX file destination that is shared by multiple rules.

# **System action**

Automatic archiving is turned off for all rules that share the z/OS UNIX file destination. However, logging to the destination file continues.

### **Operator response**

Contact the system programmer.

# System programmer response

If you want to automatically archive this destination file, examine your syslogd configuration file to identify the set of rules that specify this destination. You can combine the set of rules into a single rule or continue to use multiple rules.

1. If you want to combine the rules, specify each rule condition on a single line, separated by semicolon characters, followed by the file name and then your archive specification. For example:

```
local1.*;local2.* /var/logs/local.log -N LOCAL
```

2. If you want to use multiple rules, change the rules to specify a unique z/OS UNIX file for each rule, and configure each rule for automatic archiving. For information about configuring syslogd rules and using automatic archiving, see the topic about the syslogd daemon in z/OS Communications Server: IP Configuration Reference.

### **User response**

#### **FSUM1273**

jobname AUTOMATIC ARCHIVE NOT USED FOR RULES WITH SHARED DESTINATION

### **Explanation**

More than one syslogd rule is using the same z/OS UNIX file destination, and at least one of those rules is configured with the -N parameter, indicating the file should be automatically archived. Automatic archiving for rules that share a z/OS UNIX file destination is not supported. In the message text:

#### jobname

The job name of the syslogd application.

# **System action**

Automatic archiving is turned off for all rules that share a z/OS UNIX file destination. However, logging to the destination files continues.

### **Operator response**

Contact the system programmer.

### System programmer response

Examine the syslogd destination that is configured to receive error messages for the daemon facility and look for occurrences of message FSUM1272. Each FSUM1272 message identifies a z/OS UNIX file destination that is shared by more than one rule. Use the documentation for message FSUM1272 to correct the problem.

To determine which syslogd destination contains the FSUM1272 messages, look for a rule in the syslogd configuration file similar to: daemon.error destination. Because of the flexibility of syslogd rules, the rule you configured for these messages might be different. For information about syslogd rule syntax, see the topic about the syslogd daemon in z/OS Communications Server: IP Configuration Reference.

recv tcp inet (hostname ipaddr portnum): error\_description Errno/Rsn=errno/reason\_code

### **Explanation**

An error occurred while receiving log data from a remote syslogd client that uses TCP. The TCP connection is closed.

In the message text:

#### hostname

The hostname of the syslogd client that sent the log message. If the hostname is unknown, hostname is N/A.

#### ipaddr

The source IP address of the syslogd client that sent the log message.

#### portnum

The source port of the syslogd client that sent the log message.

#### error\_description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, <u>"Return codes (errnos)," on page 939</u> in z/OS UNIX System Services Messages and Codes.

### reason\_code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

### **System action**

Syslogd closes the TCP connection with the client. The TCP inbound thread that is associated with the connection becomes available for a new connection.

### **Operator response**

Save the system log and the log file where this message is written and contact the system programmer.

# **System programmer response**

Use the return code information to determine the cause of the recv() failure. Use the hostname, IP address, and port number to determine the syslogd application that sent the message.

### **User response**

No action is needed.

#### **Problem determination**

# **Example**

FSUM1276 recv tcp inet (example.client.com 192.168.0.1 1092): EDC5113I Bad file descriptor. Errno/Rsn=113/1123011C

FSUM1276 recv tcp inet (N/A 192.168.2.1 1093): EDC5113I Bad file descriptor. Errno/Rsn=113/1123011C

#### **FSUM1277**

### recv tcp inet (hostname ipaddr portnum): closed due to reason

### **Explanation**

An error occurred while receiving log data from a remote syslogd client that uses TCP. The TCP connection is closed.

In the message text:

#### hostname

The hostname of the syslogd client that sent the log message. If the hostname is unknown, hostname is N/A.

### ipaddr

The source IP address of the syslogd client that sent the log message.

#### portnum

The source port of the syslogd client that sent the log message.

#### **FSUM** messages

#### reason

The reason that the connection was closed. The possible values are:

- closure by peer The connection was closed by the syslogd client.
- timeout The connection was closed by the syslogd server because no log data has been received in 15 minutes.
- incomplete message received The connection was closed by the syslogd server because a complete message was not received. The connection timed out before receiving the full message or the client closed the connection.

### **System action**

Syslogd closes the TCP connection with the client. The TCP inbound thread associated with the connection becomes available for a new connection.

### **Operator response**

If the message indicates the reason for closure was "incomplete message received", this could indicate a problem. Save the system log and the log file where syslogd error messages are written and contact the system programmer. The log file can be determined by reviewing the syslogd configuration file.

Otherwise, the message is informational, and no action is needed.

# System programmer response

Use the hostname, IP address, and port number to determine the syslogd application sending the incomplete message. Contact the owner of the syslogd application to follow up on the error.

# User response

No action is needed.

### **Problem determination**

See the System Programmer response.

# Example

FSUM1277 recv tcp inet (example.host.com 192.168.2.1 14321): closed due to closure by peer

FSUM1277 recv tcp inet (example.host.com 192.168.2.0 25911): closed due to timeout

FSUM1277 recv tcp inet (example.host.com 192.168.6.1 19857): closed due to incomplete message received

#### FSUM1278

accept on TCP port portnum: error\_description Errno/Rsn=errno/reason\_code

### **Explanation**

An error occurred while the syslogd server was accepting a TCP connection from a remote syslogd client.

In the message text:

#### portnum

The port number of the local listening socket for which the accept() failed.

### error\_description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, "Return codes (errnos)," on page 939 in z/OS UNIX System Services Messages and Codes.

#### reason\_code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

# **System action**

If the return code is EIO (122), the syslogd listening socket is closed and an attempt is made to reopen it. If the socket open fails, it is retried every 30 seconds.

If the return code is EUNATCH (3448), the syslogd listening socket is closed. It will remain closed until syslogd is restarted with the MODIFY SYSLOGD, RESTART command or the SIGHUP signal. If the listening socket is dropped with the netstat DROP/-D command, an EUNATCH return code is received. In this case, informational message FSUM1282 is also written to indicate that syslogd will no longer monitor the TCP listening socket.

Otherwise, the syslogd listening socket remains open to accept other TCP connections.

# **Operator response**

If the return code is ECONNABORTED (1120) a backlog connection was reset, and no other connections were waiting to be accepted. No action is needed.

Otherwise, save the system log and the log file where this message is written and contact the system programmer.

### **System programmer response**

Use the return code information to determine the cause of the accept() failure.

Use the netstat CONN/-c SERVER command to determine the TCP receive sockets in listening state. If a listening socket configured for syslogd TCP connections is not included in the report, issue the MODIFY SYSLOGD, RESTART command or the SIGHUP signal to cause syslogd to reopen the configured listening socket.

### **User response**

No action is needed.

#### **Problem determination**

See the System Programmer response.

#### **FSUM1279**

setibmsockopt sockopt on TCP port portnum: error\_description Errno/Rsn=errno/reason\_code

### **Explanation**

An error occurred on a setibmsockopt() for a syslogd TCP listening socket. The connection is closed.

In the message text:

#### sockopt

The socket option for which the setibmsockopt() failed. The field has one of the following values:

• SO\_ACCEPTECONNABORTED – A setibmsockopt with option SO\_ACCEPTECONNABORTED failed for a TCP syslogd listening socket. The failure occurred when syslogd was setting up the socket. The SO\_ACCEPTECONNABORTED socket option is used to enable an accept() call to return ECONNABORTED instead of blocking when a backlog connection has been reset and there are no other connections to be accepted.

#### portnum

The port number of the syslogd TCP listening socket that failed on the setibmsockopt().

#### error description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, "Return codes (errnos)," on page 939 in z/OS UNIX System Services Messages and Codes.

#### reason\_code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

**Note:** This error can occur before syslogd processed the syslog configuration file. In that case, this message appears at the operator console.

# **System action**

The syslogd listening socket is closed. An attempt will be made every 30 seconds to reopen the socket.

# **Operator response**

Save the system log and the log file where this message is written and contact the system programmer.

# System programmer response

Use the return code information to determine the cause of the setibmsockopt() failure. If subsequent attempts by syslogd to open the listening socket continue to fail on the setibmsockopt() call, contact the IBM Support Center and provide the system log and the log file where this message is found.

### **User response**

No action is needed.

#### Example

FSUM1279 setibmsockopt SO\_ACCEPTECONNABORTED on TCP port 6514: EDC8109I Protocol not available. Errno/Rsn=1109/CB270078

**FSUM1280** 

setsockopt sockopt (hostname ipaddr portnum): error\_description Errno/ Rsn=errno/reason\_code

### **Explanation**

An error occurred while syslogd was attempting to set a socket option for an AF\_INET or AF\_INET6 socket.

In the message text:

#### sockopt

The socket option for which the setsockopt() failed. The field has one of the following values:

- SO\_SNDTIMEO A setsockopt() with option SO\_SNDTIMEO failed for a TCP syslogd client socket. The failure occurred when syslogd was setting up a TCP connection with a remote syslogd server. The SO\_SNDTIMEO socket option is set with a time value to cause a blocked send() to return control every second, allowing other events to be detected such as a syslogd shutdown.
- o SO\_LINGER A setsockopt() with option SO\_LINGER failed for a TCP syslogd client socket. The setsockopt() with SO\_LINGER was done after a send() of log data to a remote syslogd server failed. The SO\_LINGER socket option directs the TCP/IP stack to abort the connection and discard any data waiting to be sent.

#### hostname

Hostname of the syslogd server to which the local syslogd is configured to connect. If the hostname is unknown, the value is N/A. The hostname might be unknown if the configured destination is an IP address.

#### ipaddr

IP address of the syslogd server to which the local syslogd is configured to connect.

#### portnum

Port number of the syslogd server to which the local syslogd is configured to connect.

#### error\_description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, "Return codes (errnos)," on page 939 in z/OS UNIX System Services Messages and Codes.

#### reason code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

### **System action**

The socket is closed, and processing continues. The connection will be retried when the next message is processed for the remote server destination.

### **Operator response**

If subsequent setsockopt() calls are successful, no action is needed. If the setsockopt() call continues to fail, save the system log and the log file where this message is written and contact the system programmer.

### **System programmer response**

Use the return code information to determine why the setsockopt() function failed.

#### User response

No action is needed.

FSUM1280 setsockopt SO\_LINGER (www.example.com 192.168.1.9 6514): EDC5113I Bad file descriptor. Errno/Rsn=113/1110011C

#### **FSUM1281**

#### syslog\_service/tcp: unknown service

# **Explanation**

The syslog or syslog-tls service for tcp was not found in /etc/services. Processing continues by using a default listening port.

In the message text:

### syslog\_service

This field has one of the following values:

- syslog The syslog service for the tcp protocol was not found in /etc/services. A TCP listening socket will be opened on the default TCP port 514 to accept connections from syslogd clients.
- syslog-tls The syslog-tls service for the tcp protocol was not found in /etc/services. A TCP listening socket will be opened on the default TCP port 6514 to accept connections protected by TLS from syslogd clients.

**Note:** Because this error occurred before syslogd processed the syslog configuration file, this message appears only at the operator console

### **System action**

Processing continues by using the default port.

### **Operator response**

Contact the system programmer and provide this message.

### **System programmer response**

Determine whether the default port is the correct port to use for accepting connections from remote TCP syslogd clients. Include the syslog or syslog-tls service for the tcp protocol in the /etc/services file or the

### **FSUM** messages

hlq.ETC.SERVICES data set. You can use the syslog or syslog-tls service, or both, with the tcp protocol. You should also use the PORT statement in the TCP/IP profile to reserve the ports for use by syslogd.

An error was detected on the AF\_INET or AF\_INET6 protocol socket, syslogd will no longer monitor the protocol socket

# **Explanation**

This message is generated after a nonrecoverable socket error. The return code information is available in the preceding message, an FSUM1204 or FSUM1278 message. This message is for informational purposes only.

In the message text:

#### protocol

This field identifies the socket where the error occurred as the syslogd TCP listening socket for clear-text messages (TCP) or TLS-protected messages (TCP-TLS).

### **System action**

The syslogd listening socket is closed. New connections from remote syslogd clients cannot be accepted for the socket.

# **Operator response**

No action needed.

### System programmer response

No action is needed.

### **User response**

No action is needed.

### **Problem determination**

Not applicable.

#### Source

z/OS Communications Server TCP/IP: syslogd

#### Module

syslogd.c

# **Routing code**

Not applicable.

# **Descriptor code**

Not applicable.

#### **Automation**

Not applicable.

### **Example**

• When the error occurred for the TCP listening socket for clear-text connections:

FSUM1278 accept TCP port 514: Errno/Rsn=3448/749F0442

FSUM1282 An error was detected on the AF\_INET or AF\_INET6 TCP socket, syslogd will no longer monitor the TCP socket

• When the error occurred for the TCP listening socket for TLS-protected connections:

FSUM1278 accept TCP port 6514: Errno/Rsn=3448/749F0442

FSUM1282 An error was detected on the AF\_INET or AF\_INET6 TCP-TLS socket, syslogd will no longer monitor the TCP-TLS socket

### **FSUM1283**

syslogd: send (hostname ipaddr portnum): error\_description Errno/ Rsn=errno/reason code

# **Explanation**

An error occurred when the syslog daemon (syslogd) was sending to the TCP output destination identified in the message.

In the message text:

#### hostname

The TCP output destination hostname to which the send failed. If the hostname is unknown, hostname is N/A. The hostname might be unknown if the configured destination is an IP address.

#### **FSUM** messages

#### ipaddr

The TCP output destination IP address to which the send failed.

#### portnum

The TCP output destination port to which the send failed.

### error\_description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, "Return codes (errnos)," on page 939 in z/OS UNIX System Services Messages and Codes.

#### reason code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

# **System action**

Processing continues. The connection to the TCP output destination is reset and the current message is discarded, syslogd will attempt to reestablish the connection when the next message is processed for the TCP output destination.

# **Operator response**

Save the system log and the log file where this message is written and contact the system programmer.

### **System programmer response**

Review the error information from FSUM1283 and the syslogd error log.

# **User response**

No action is needed.

### **Problem determination**

See the System Programmer Response.

#### Source

### **Example**

FSUM1283 syslogd: send (www.example.com 192.168.1.9 6514): EDC5122I Input/output error. Errno/Rsn=122/75DF0381

#### **FSUM1284**

SYSLOGD: TCP SOCKET (hostname ipaddr portnum): error\_description ERRNO/RSN=errno/reason code

### **Explanation**

The syslog daemon (syslogd) cannot open a TCP socket to forward messages to the TCP output destination identified in the message. This message is written on the first failed attempt to open the socket.

In the message text:

#### hostname

The TCP output destination hostname of the configured syslogd rule. If the hostname is unknown, hostname is N/A. The hostname might be unknown if the configured destination is an IP address.

#### ipaddr

The TCP output destination IP address of the configured syslogd rule.

#### portnum

The TCP output destination port of the configured syslogd rule.

#### error\_description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, <u>"Return codes (errnos)," on page 939</u> in z/OS UNIX System Services Messages and Codes.

### reason\_code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

**Note:** This message is written to the operator console.

# **System action**

Processing continues. syslogd is unable to forward messages to the TCP destination until a socket can be opened. An attempt is made every second to open the socket.

### **Operator response**

Verify that the TCP/IP stack is active on the system. If not, start the TCP/IP stack.

If that does not resolve the problem, save the system log and the log file where syslogd error messages are written and contact the system programmer. The log file can be determined by reviewing the syslogd configuration file.

#### **System programmer response**

Review the error information from FSUM1284 and the syslogd error log.

### User response

No action is needed.

FSUM1284 SYSLOGD: TCP SOCKET (N/A 192.168.0.1 6514): EDC5112I RESOURCE TEMPORARILY UNAVAILABLE. ERRNO/RSN=112/74B30296

#### **FSUM1285**

SYSLOGD: CONNECT (hostname ipaddr portnum): error\_description ERRNO/RSN=errno/reason\_code

### **Explanation**

The syslog daemon (syslogd) cannot connect to the TCP output destination identified in the message. This message is written on the first failed attempt to connect to the destination.

In the message text:

#### hostname

The TCP output destination hostname to which syslogd is unable to connect. If the hostname is unknown, hostname is N/A. The hostname might be unknown if the configured destination is an IP address.

#### ipaddr

The TCP output destination IP address to which syslogd is unable to connect.

#### portnum

The TCP output destination port to which syslogd is unable to connect.

#### error description

Describes the meaning of *errno*.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, "Return codes (errnos)," on page 939 in z/OS UNIX System Services Messages and Codes.

#### reason\_code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

**Note:** This message is written to the console.

### **System action**

Processing continues. Syslogd is unable to forward messages to the TCP destination until it connects to the destination. An attempt is made every second to connect to the destination.

### **Operator response**

Save the system log and the log file where syslogd error messages are written and contact the system programmer. The log file can be determined by reviewing the syslogd configuration file.

### System programmer response

Review the error information from FSUM1285 and the syslogd error log.

Verify that the TCP destination and port, configured in the syslogd configuration file, can be reached from this system. If not, correct the configuration and restart syslogd by using the MODIFY SYSLOGD, RESTART command or the SIGHUP signal.

### **User response**

#### **FSUM1286**

#### Unable to create token\_name token (rc=retcode)

### **Explanation**

An error occurred when syslogd attempted to create a nonpersistent system token to indicate that this instance of syslogd can process log data that is received over the network.

In the message text:

#### **FSUM** messages

#### tokenname

The name of the MVS<sup>™</sup> token to which syslogd is trying to get exclusive access. This value is NETWORK\_SYSLOG for syslogd.

#### retcode

The return code from the MVS token service. See *z/OS MVS Programming: Authorized Assembler Services Reference EDT-IXG* for a complete list of IEANTCR return and reason codes.

**Note:** This error appears on the operator console because it occurs before syslogd has processed the syslog configuration file.

# **System action**

Syslogd ends.

### **Operator response**

If subsequent attempts to start syslogd fail, save the system log and contact the system programmer.

### System programmer response

Contact the IBM Support Center and provide the system log.

### **User response**

No action is needed.

#### **Problem determination**

**FSUM1287** 

getsockopt sockopt for TCP port portnum: error\_description Errno/Rsn=errno/reason\_code

# **Explanation**

An error occurred while the syslogd server was attempting to get a socket option for a TCP socket.

In the message text:

#### sockopt

The socket option for which the getsockopt() failed. The field has one of the following values:

• SO\_RCVBUF – The syslogd server was attempting to get the TCP receive buffer size. The failure occurred when syslogd was setting up a TCP listening socket reserved for accepting connections from remote syslogd clients.

#### portnum

The port number of the local listening socket for which the getsockopt() failed.

### error\_description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, "Return codes (errnos)," on page 939 in z/OS UNIX System Services Messages and Codes.

#### reason code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

**Note:** This error can occur before syslogd processes the syslog configuration file. In that case, this message appears at the operator console.

# System action

Processing continues. syslogd does not attempt to set the receive buffer size for the socket, but the socket set up continues.

# **Operator response**

Save the system log and the log file where this message is written and contact the system programmer.

# System programmer response

Use the return code information to determine the cause of the getsockopt() failure.

### User response

### **FSUM1288**

# THREAD POOL CANNOT BE CREATED FOR INBOUND TCP CONNECTIONS

### **Explanation**

During initialization, the syslog daemon (syslogd) was unable to allocate a thread pool for use with incoming TCP connections. When syslogd is started with the -T option, the -S option, or both, syslogd attempts to allocate a thread pool to be used for incoming TCP connections.

# **System action**

The syslog daemon shuts down.

### **Operator response**

If the syslog daemon does not need to support incoming TCP connections, restart syslogd without the -T and -S start options.

If syslogd needs to support incoming TCP connections, save the system log and contact the system programmer.

# System programmer response

Review the system log.

By default, syslogd allocates 128 threads for incoming TCP connections. Ensure that the MAXTHREADS parameter in the BPXPRMxx parmlib member, which specifies the maximum number of threads that a single process can have active concurrently, is large enough to accommodate these threads. The syslog daemon also has a few threads for internal processing plus one thread for each unique output destination.

If a small number of remote systems are expected to connect and send messages to this syslogd instance, the number of threads in the thread pool can be limited by using the SYSLOGD\_TCPTHREADPOOL\_SIZE environment variable. See *Syslogd considerations for receiving data over TCP* in *z/OS Communications Server: IP Configuration Guide.*

FSUM1249 SYSLOGD SHUTDOWN COMPLETE

#### **FSUM1289**

Message queue limit reached while connecting to TCP output destination: hostname ipaddr portnum

# **Explanation**

The syslog daemon (syslogd) cannot connect to the TCP output destination identified in the message. The number of messages queued to be forwarded to the TCP output destination has reached the internal queue limit. The queued messages are discarded.

In the message text:

#### hostname

The hostname of the TCP output destination to which syslogd is unable to connect. If the hostname is unknown, *hostname* is N/A. The hostname might be unknown if the configured destination is an IP address.

#### ipaddr

The IP address of the TCP output destination to which syslogd is unable to connect.

# portnum

The port of the TCP output destination to which syslogd is unable to connect.

# **System action**

Processing continues. The messages queued to the TCP destination are discarded. When a new message is queued for the TCP destination, syslogd will again attempt to open a socket and connect to the output destination.

# **Operator response**

Verify that the TCP/IP stack is active on the system. If not, start the TCP/IP stack.

If that does not resolve the problem, save the system log and the log file where this message is written and contact the system programmer.

# System programmer response

Review the system log to determine if there is an FSUM1284 or FSUM1285 message that provides further information on the failure. Review the syslogd error log.

#### **FSUM** messages

Verify that the TCP destination IP address and port, configured in the syslogd configuration file, can be reached from this system. If not, correct the configuration and restart syslogd by using the MODIFY SYSLOGD, RESTART command or the SIGHUP signal.

# **User response**

No action is needed.

#### **Problem determination**

See the System Programmer Response.

ezasythd.c

# **Routing code**

Not applicable.

# **Descriptor code**

Not applicable.

### **Automation**

Not applicable.

### **Example**

The following example is for a rule that is configured with an IP address where the hostname is unknown:

FSUM1289 Message queue limit reached while connecting to TCP output destination: N/A 192.168.1.9 6514

The following example is for a rule that is configured with a host name:

FSUM1289 Message queue limit reached while connecting to TCP output destination: www.example.com 192.168.1.9 6514

### **FSUM1290**

syslogd has discarded messages for one or more TCP output destinations

# **Explanation**

The syslog daemon (syslogd) has discarded at least one message that is destined to at least one TCP output destination in the past hour. This message is written to the console as an eventual action message when syslogd detects that a message has been discarded. It is deleted from the console by syslogd when no messages that are destined to a TCP output destination have been discarded in the last hour.

This message is also written to any output destination where syslogd error messages are collected along with FSUM1291 messages. FSUM1291 messages provide additional information on the specific output destinations to which syslogd was unable to forward messages, as well as the number of messages discarded.

# System action

Processing continues.

### Operator response

Save the system log and the log file where syslogd error messages are written and contact the system programmer. The log file can be determined by reviewing the syslogd configuration file.

### System programmer response

Messages are discarded when an internal queue limit is reached for a TCP output destination. Messages can also be discarded when an AT-TLS configuration error is detected for an output destination configured with secure="ves".

Review the syslogd error log. Use the FSUM1291 messages to determine for which destinations syslogd is discarding messages. See the System Programmer Response for the FSUM1291 message for steps to take to address the problem.

The FSUM1290 message will remain on the console until no discards have been detected for an hour.

### User response

No action is needed.

### **Problem determination**

See the System Programmer Response.

#### Source

z/OS Communications Server TCP/IP: syslogd

### Module

syslogd.c

### **Routing code**

1,8

### **Descriptor code**

2, 7

### **Automation**

Not applicable.

#### Example

This message is written to the console as an eventual action message:

FSUM1290 SYSLOGD HAS DISCARDED MESSAGES FOR ONE OR MORE TCP OUTPUT DESTINATIONS

This message can also be written to an output destination file along with other more detailed messages:

FSUM1290 syslogd has discarded messages for one or more TCP output destinations

FSUM1291 syslogd has discarded 21 messages for TCP output destination:

www.example.com 192.168.1.9 6514

#### **FSUM1291**

# syslogd has discarded *number* messages for TCP output destination: hostname ipaddr portnum

# **Explanation**

The syslog daemon (syslogd) has discarded at least one message destined to the TCP output destination identified in the message in the past hour. This message is written when the first message or group of messages for the destination is discarded and once an hour if additional messages have been discarded.

In the message text:

#### number

The number of messages discarded.

#### hostname

The hostname of the TCP output destination for which messages were discarded. If the hostname is unknown, *hostname* is N/A. The hostname might be unknown if the configured destination is an IP address.

#### ipaddr

The IP address of the TCP output destination for which messages were discarded.

#### portnum

The port of the TCP output destination for which messages were discarded.

# System action

Processing continues.

### **Operator response**

Save the system log and the log file where this message is written and contact the system programmer.

# System programmer response

Messages are discarded when an internal queue limit is reached for a TCP output destination. Messages can also be discarded when an AT-TLS configuration error is detected for an output destination configured with secure="yes". An FSUM1295 message is written to the console if the discards are due to an AT-TLS configuration error.

Take the following steps to address the problem.

- 1. Verify that the TCP/IP stack is active on the system. If not, start the TCP/IP stack.
- 2. Verify that the TCP destination and port, configured in the syslogd configuration file, can be reached from this system. If not, correct the configuration and restart syslogd by using the MODIFY SYSLOGD, RESTART command or the SIGHUP signal.
- 3. Verify that the secure setting for the rule in the syslogd configuration matches the destination syslog daemon's support. The secure="yes" setting should be used if the destination expects the messages to be protected by TLS. The secure="no" setting should be used if the destination expects the messages to be sent without TLS protection. If needed, correct the configuration and restart syslogd by using the MODIFY SYSLOGD, RESTART command or the SIGHUP signal.
- 4. If the rule in the syslogd configuration has a setting of secure="yes", verify that AT-TLS policy is active and that there is an AT-TLS client rule for this connection. An FSUM1295 message is written to the console that provides details about AT-TLS failures. Review the FSUM1295 documentation for additional information.
- 5. The destination syslog daemon might be unable to handle the amount of data being forwarded to it. Review your syslogd configuration file to determine what messages are being forwarded to the destination. It is recommended that debug or verbose messages be saved locally to a file, limiting the messages sent over the network to error messages or messages that are expected to have a low volume.

### **User response**

#### **FSUM1294**

# setsockopt *sockopt* for TCP port *portnum* is unable to set buffer size to 64K minimum

### **Explanation**

An error occurred while syslogd was attempting to set a socket option for a TCP socket.

In the message text:

#### sockopt

The socket option for which the setsockopt() failed. The field has one of the following values:

 SO\_RCVBUF – syslogd was attempting to set the TCP receive buffer size to 64 K. The failure occurred when syslogd was setting up a TCP listening socket reserved for accepting connections from remote syslogd clients.

Syslogd attempts to allow dynamic right sizing (DRS) to grow and contract the TCP receive buffer size as needed. To do so, the receive buffer must be at least 64 K.

• SO\_SNDBUF – syslogd was attempting to set the TCP send buffer size to 64 K. The failure occurred when syslogd was setting up a TCP connection with a remote syslogd server.

Syslogd attempts to allow outbound right sizing (ORS) to grow and contract the TCP send buffer as needed. To do so, the send buffer must be set to at least 64 K.

#### portnum

When the *sockopt* is SO\_RCVBUF, this is the port number of the local listening socket for which the setsockopt() failed.

When the *sockopt* is SO\_SNDBUF, this is the port number of the syslogd server to which the local syslogd is configured to connect.

**Note:** This error can occur before syslogd processed the syslog configuration file. In that case, this message appears at the operator console.

# **System action**

Processing continues. syslogd is unable to set the receive or send buffer size for the socket, but the socket/connection set up continues.

### **Operator response**

Save the log file where this message is written and contact the system programmer.

#### System programmer response

If the message indicates that the socket option was SO RCVBUF:

The TCP receive buffer size was less than 64 K and syslog's attempt to set it to 64 K failed. syslogd attempts to allow dynamic right sizing (DRS) to grow and contract the TCP receive buffer size as needed. To do so, the receive buffer must be at least 64 K.

Review the settings of TCPRCVBUFRSIZE and TCPMAXRCVBUFRSIZE on the TCPCONFIG statement in the TCP/IP profile. If you want syslogd to be able to use dynamic right sizing for the TCP sockets on which it receives data, adjust the TCP/IP profile settings as appropriate for your environment. Stop and restart syslogd to pick up the new TCP/IP profile settings.

• If the message indicates that the socket option was SO\_SNDBUF:

The TCP send buffer size was less than 64 K and syslog's attempt to set it to 64 K failed. syslogd attempts to allow outbound right sizing (ORS) to grow and contract the TCP send buffer as needed. To do so, the send buffer must be set to at least 64 K.

Review the settings of TCPSENDBUFRSIZE and TCPMAXSENDBUFRSIZE on the TCPCONFIG statement in the TCP/IP profile. If you want syslogd to be able to use outbound right sizing for the TCP sockets on which it sends data, adjust the TCP/IP profile settings as appropriate for your environment. Stop and restart syslogd to pick up the new TCP/IP profile settings.

### **Example**

FSUM1294 setsockopt SO\_SNDBUF for TCP port 514 is unable to set buffer size to 64K minimum

FSUM1294 setsockopt SO\_RCVBUF for TCP port 6514 is unable to set buffer size to 64K minimum

### **FSUM1295**

syslogd localhost\_string (remote\_hostname remote\_addr remote\_port) local\_error

### **Explanation**

The syslog daemon (syslogd) detected that TLS is not being used to protect the TCP connection to the remote syslogd. When syslogd is started with the -S start option, or a configuration file rule uses the -A(...) forwarding action with secure="yes", the TCP connection to the remote syslogd must be protected by TLS.

In the message text:

#### localhost\_string

Identifies the local syslogd as a client or server. This field has one of the following values:

#### client connection to

Indicates that the local syslogd is a client connecting to a remote syslogd server.

#### server connection from

Indicates that the local syslogd is a server that accepted a connection from a remote syslogd client.

#### remote\_hostname

The hostname of the remote syslogd. If the hostname is unknown, *remote\_hostname* is N/A. The hostname might be unknown if the configured TCP destination on a syslogd rule is an IP address or if the source IP address was not able to be resolved to a hostname.

#### remote addr

The IP address of the remote syslogd.

#### remote\_port

The port number of the remote syslogd.

#### local error

The error on the local syslogd that kept TLS protection from being established for the connection. This field has one of the following values:

- requires TCPCONFIG TTLS and AT-TLS policy installed
- must match an AT-TLS rule
- · matches an AT-TLS rule that disables TLS
- · matches an AT-TLS rule that specifies application controlled
- · is not secured by TLS

Note: For local syslogd client errors, this message is written to the operator console.

### System action

Processing continues. If this error is detected by the local syslogd server, syslogd will close the inbound connection and wait for another inbound connection request from the remote syslogd client.

If this is error is detected by the local syslogd client, the system action depends on the *local\_error* in message FSUM1295.

- If the *local\_error* is "matches an AT-TLS rule that disables TLS" or "matches an AT-TLS rule that specifies application controlled", the syslogd rule will be disabled for the outbound TCP connection. The disabled rule will keep syslogd from forwarding messages to the remote syslogd server.
- Otherwise, syslogd will close the outbound connection and try to establish another secure connection with the syslogd server once every 60 seconds.

### **Operator response**

This could be a transitory error when syslogd is started before TTLS is enabled and AT-TLS policy is installed in the TCP/IP stack.

If it is a persistent problem, save the system log, the log file where syslogd error messages are written, and the log file where AT-TLS error messages are written and contact the system programmer.

### System programmer response

Review any AT-TLS error messages along with these actions.

Based on the *local\_error* in message FSUM1295, take the following actions:

• If the *local\_error* in message FSUM1295 indicates "requires TCPCONFIG TTLS and AT-TLS policy installed", there is no AT-TLS policy installed for the TCP/IP stack or AT-TLS is not enabled with the TTLS parameter on the TCPCONFIG statement in the TCP/IP profile.

Use the Netstat CONFIG/-f report to verify the TTLS setting on the TCPCONFIG statement.

Use the Netstat TTLS/-x report with the GROUP option to verify that an AT-TLS policy is installed in the TCP/IP stack.

See Application Transparent Transport Layer Security data protection in z/OS Communications Server: IP Configuration Guide for information on AT-TLS setup.

• If the *local\_error* in the FSUM1295 indicates "must match an AT-TLS rule", no matching AT-TLS rule was found for the local syslogd.

If the local syslogd is a server receiving messages from a remote syslogd client:

- Review the /etc/services (or hlq.ETC.SERVICES) file for your installation to determine the TCP port used for the syslog-tls service. If a port is not defined, the default is TCP port 6514.
- Update the AT-TLS policy to define an AT-TLS server rule for the configured syslog-tls port.

If the local syslogd is a client sending messages to a remote syslogd server:

- The remote\_hostname, remote\_addr, and remote\_port in this message indicate the remote syslogd server for which there is no AT-TLS rule.
- If the remote syslogd server hostname, IP address and port are correct, update the AT-TLS policy to define an AT-TLS client rule by using the remote port and remote addr
- If the remote syslogd server IP address and port are not correct, locate the forwarding rule in the syslogd configuration file that is sending to the destination. Update the rule to include the correct destination information.
- If the *local\_error* in message FSUM1295 indicates "matches an AT-TLS rule that disables TLS", AT-TLS is disabled for the AT-TLS rule the local syslogd matches. In the policy file, the TTLSEnabled parameter is set to OFF in the matching rule.

If you have an AT-TLS rule defined for the local syslogd with AT-TLS disabled and you want the TCP connection to be protected by TLS, update the AT-TLS rule to have AT-TLS enabled.

If you don't have an AT-TLS rule defined for the local syslogd, review the steps above for "must match an AT-TLS rule".

**Result:** When this error occurs for a syslogd client, the syslogd rule forwarding to this output destination is disabled. After updating the AT-TLS policy and installing it into the TCP/IP stack, force syslogd to reprocess the syslogd configuration file by using the MODIFY SYSLOGD, RESTART command or issuing the SIGHUP signal.

• If the *local\_error* in message FSUM1295 indicates "matches an AT-TLS rule that specifies application controlled", the matching AT-TLS rule is configured with the application control setting on. In the policy file, the ApplicationControlled parameter is set to ON. syslogd is AT-TLS aware but not controlling. The ApplicationControlled parameter must be set to OFF (the default) in the policy.

If you have an AT-TLS rule defined for the local syslogd with the application control setting enabled, update the AT-TLS rule to indicate that the application is not controlling.

If you don't have an AT-TLS rule defined for the local syslogd, review the steps above for "must match an AT-TLS rule".

**Result:** When this error occurs for a syslogd client, the syslogd rule forwarding to this output destination is disabled. After updating the AT-TLS policy and installing it into the TCP/IP stack, force syslogd to reprocess the syslogd configuration file by using the MODIFY SYSLOGD, RESTART command or issuing the SIGHUP signal.

• If the local error in message FSUM1295 indicates "is not secured by TLS".

Review any AT-TLS error messages that have been written.

If you update and install your AT-TLS policy file for a local syslogd server, no other action is required. New connections to the secure syslogd server port will use the updated policy.

If you update and install your AT-TLS policy for a local syslogd client, an additional step is required if the <code>local\_error</code> is "matches an AT-TLS rule that disables TLS" or "matches an AT-TLS rule that specifies application controlled". Message FSUM1300 is also written in these cases to alert you that the syslogd rule was disabled. After installing the AT-TLS policy into the TCP/IP stack, use the MODIFY SYSLOGD,RESTART command or the SIGHUP signal to force syslogd to reprocess the syslogd configuration file. This processing will re-enable the syslogd rule.

FSUM1295 SYSLOGD CLIENT CONNECTION TO (N/A 192.168.0.1 6514) MATCHES AN AT-TLS RULE THAT SPECIFIES APPLICATION CONTROLLED

### **FSUM1296**

# SYSLOGD UNABLE TO ACCEPT ANY NEW INBOUND TCP CONNECTIONS, LIMIT OF *limit* REACHED

### **Explanation**

This message is written to the console as an eventual action message when the syslog daemon (syslogd) is unable to accept new TCP connections from remote TCP syslogd clients.

In the message text:

#### limit

The number of TCP connections from remote TCP syslogd clients that can be active concurrently.

# **System action**

Processing continues. New TCP connections from remote TCP syslogd clients cannot be accepted. When an existing connection closes, the number of connections falls below the limit and the eventual action message is deleted.

### **Operator response**

Save the system log and the log file where syslogd error messages are written and contact the system programmer.

### System programmer response

When syslogd is started, a pool of TCP threads is created for use by inbound connections. This limits the number of remote TCP syslogd clients that can be connected concurrently. By default, the pool contains 128 threads. The environment variable SYSLOGD\_TCPTHREADPOOL\_SIZE can be used to decrease the number of threads allocated.

If you used the environment variable to limit the size of the TCP thread pool, consider whether the limit should be increased to allow more remote TCP syslogd clients to connect concurrently. To increase the size of the TCP thread pool, the environment variable should be set to a value appropriate for your environment. Then, syslogd must be stopped and restarted for the larger thread pool to take effect.

Use the netstat CONN/-c command with the PORT filter to display the connections that are established with the syslogd TCP listening ports. In the netstat report, determine whether the remote peers ("Foreign Socket") connected to syslogd are expected. The netstat DROP/-D command can be used to drop a TCP connection. It is recommended that IP filter rules be used to control access to the syslogd TCP listening sockets.

SYSLOGD UNABLE TO ACCEPT ANY NEW INBOUND TCP CONNECTIONS, LIMIT OF 128 REACHED

**FSUM1297** 

syslogd localhost\_string (remote\_hostname remote\_addr remote\_port)
SIOCTTLSCTL ioctl: error\_description Errno/Rsn=errno/reason\_code

# **Explanation**

The syslog daemon (syslogd) detected a failure when issuing the SIOCTTLSCTL ioctl. When syslogd is started with the -S start option, or a syslogd configuration file rule uses the -A(...) forwarding action with secure="yes", this ioctl is used to verify that a TCP connection to a remote syslogd is secured by TLS.

In the message text:

#### localhost\_string

Identifies the local syslogd as a client or server. This field has one of the following values:

#### client connection to

Indicates that the local syslogd is a client connecting to a remote syslogd server

#### server connection from

Indicates that the local syslogd is a server that accepted a connection from a remote syslogd client

#### remote\_hostname

The hostname of the remote syslogd. If the hostname is unknown, *remote\_hostname* is N/A. The hostname might be unknown if the configured TCP destination on a syslogd rule is an IP address or if the source IP address cannot be resolved to a hostname.

#### remote addr

The IP address of the remote syslogd.

### remote\_port

The port number of the remote syslogd.

### error\_description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, <u>"Return codes (errnos)," on page 939</u> in z/OS UNIX System Services Messages and Codes.

#### reason\_code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

# System action

Processing continues. If this error is detected by a local syslogd server, syslogd will close the inbound connection and wait for another inbound connection request from the remote syslogd client. If this is error is detected by a local syslogd client, syslogd will close the outbound connection and try to establish another secure connection with the syslogd server once every 60 seconds.

### **Operator response**

Save the system log, the log file where syslogd error messages are written, and the log file where AT-TLS error messages are written and contact the system programmer.

### System programmer response

Review the error information from message FSUM1297. This syslogd error is typically seen when the TLS negotiation failed for the syslogd connection. Review any AT-TLS error messages that have been written.

#### User response

No action is needed.

## **Example**

FSUM1297 syslogd client connection to (example.remoteserver.com 192.168.0.1 6514) SIOCTTLSCTL ioctl: EDC8121I Connection reset. Errno/Rsn=1121/74520442

FSUM1297 syslogd server connection from (example.remoteclient.com 192.168.2.1 55535) SIOCTTLSCTL ioctl: EDC8121I Connection reset. Errno/Rsn=1121/74520442

#### **FSUM1298**

bind on TCP port portnum: error\_description Errno/Rsn=errno/reason\_code

### **Explanation**

The bind function for a TCP listening socket used to accept connections from remote syslogd clients failed.

In the message text:

#### portnum

The port number of the syslogd TCP listening socket that failed on the bind().

#### error\_description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, "Return codes (errnos)," on page 939 in z/OS UNIX System Services Messages and Codes.

#### reason code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

**Note:** This error can occur before syslogd processed the syslog configuration file. In that case, this message appears at the operator console.

### **System action**

The socket is closed, and processing continues. syslogd will not accept TCP connections from remote syslogd clients. An attempt will be made every 30 seconds to reopen the socket and reissue the bind() call.

## **Operator response**

If a subsequent bind() call completes successfully, no action is needed. If the bind() call continues to fail, save the system log and the log file where this message is written and contact the system programmer.

## System programmer response

Use the return code information to determine the cause of the bind() failure.

Verify that the port used for the tcp syslog or syslog-tls service is defined in the /etc/services file or the hlq.ETC.SERVICES data set. The port should also be reserved on the PORT statement in the TCP/IP profile for use by syslogd. See *Configuring the syslog daemon, Considerations when receiving messages using UDP* in z/OS *Communications Server: IP Configuration Guide* for more information.

FSUM1299 socket on TCP port 6514: EDC5112I Resource temporarily unavailable. Errno/Rsn=112/12CA00B6

#### **FSUM1300**

# jobname RULE ON LINE num IN filename WAS DISABLED (hostname ipaddr portnum)

## **Explanation**

The syslogd rule on line number *num* in the syslog configuration file named *filename* was disabled. The rule is configured to forward messages over the network.

In the message text:

#### jobname

The job name of the syslogd application.

#### num

The line or record number of the statement in the syslog configuration file.

#### filename

The name of the syslog configuration file.

#### hostname

The hostname of the remote output destination configured for the disabled rule. If the hostname is unknown, hostname is N/A. The hostname might be unknown if the configured destination on a rule is an IP address.

#### ipaddr

The IP address of the remote output destination configured for the disabled rule. If the IP address is unknown, *ipaddr* is N/A. The IP address might be unknown if the configured destination on the rule is a hostname.

#### portnum

The port number of the remote output destination for the disabled rule.

## **System action**

Processing continues but messages that match this syslogd rule will no longer be forwarded to the remote destination.

#### **Operator response**

Save the system log and the log file where syslogd error messages are written and contact the system programmer.

### System programmer response

This informational message indicates that syslogd stopped forwarding messages for the syslogd rule. In most cases an additional syslogd error message, as documented below, is written to provide the specific error that led to the rule being disabled. Review the actions provided in the additional message.

Message FSUM1300 is written in the following cases:

- A sendto() failure for a UDP remote destination. Additional syslogd error message FSUM1211 is written to provide the sendto() error information.
- An AT-TLS rule for the syslogd client was configured incorrectly. Additional syslogd error message FSUM1295 is written.

Note: Not all failures to establish TLS protection result in disabling the syslogd rule.

- A syslogd configuration rule specified an IPv6 address but the TCP/IP stack is not IPv6-enabled. Additional syslogd error message FSUM1231 is written.
- A thread cannot be allocated for this rule that forwards to a TCP destination.
  - When the syslogd configuration file is processed a thread is allocated for each unique destination. If a thread cannot be allocated for a TCP destination, the rule is disabled and an FSUM1300 message is written.

- Ensure that the MAXTHREADS parameter in the BPXPRMxx parmlib member, which specifies the maximum number of threads that a single process can have active concurrently, is large enough to accommodate the threads needed for syslogd.
  - If syslogd is started with the -S or -T start option, 128 threads are allocated for incoming TCP connections by default. In addition, one thread is allocated for each unique destination and a few threads are allocated for internal processing.
- The MAXTHREADS parameter value can be changed in the BPXPRMxx member, or dynamically changed using the SETOMVS or SET OMVS command.
- The SYSLOGD\_TCPTHREADPOOL\_SIZE environment variable can be used to limit the number of threads created for inbound TCP connections if only a few remote syslogd clients are expected to connect to syslogd.

After resolving the problem that caused the rule to be disabled, issue the MODIFY SYSYLOGD, RESTART command or SIGHUP signal to cause syslogd to reread the configuration file and reenable the rule.

#### Automation

This message is written to the system console. You might want to automate on this message to monitor syslogd and take appropriate action.

## **Example**

FSUM1300 SYSLOGD RULE ON LINE 86 IN /etc/syslog.conf WAS DISABLED (example.server.com 192.168.0.1 514)

### **FSUM1301**

listen on TCP port portnum: error\_description Errno/Rsn=errno/reason\_code

### **Explanation**

The listen() function failed for a TCP listening socket that is used to accept connections from remote syslogd clients.

In the message text:

#### **FSUM** messages

#### portnum

The port number of the syslogd TCP listening socket that failed on the listen().

#### error description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, "Return codes (errnos)," on page 939 in z/OS UNIX System Services Messages and Codes.

#### reason\_code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

**Note:** This error can occur before syslogd processes the syslog configuration file. In that case, this message appears at the operator console.

## **System action**

The socket is closed, and processing continues. Syslogd will not accept TCP connections from remote syslogd clients. An attempt will be made every 30 seconds to re-open the socket and re-issue the listen() call.

## **Operator response**

If subsequent listen() attempts are successful, no action is needed. If the listen() call continues to fail, save the system log and the log file where this message is written and contact the system programmer.

## System programmer response

Use the return code information to determine the cause of the listen() failure.

Verify that the port being used for the tcp syslog or syslog-tls service is defined in the /etc/services file or the hlq.ETC.SERVICES data set. The port should also be reserved on the PORT statement in the TCP/IP profile for use by syslogd.

getsockopt sockopt (hostname ipaddr portnum): error\_description Errno/ Rsn=errno/reason\_code

## **Explanation**

An error occurred while the syslogd client was attempting to get a socket option for a TCP socket.

In the message text:

#### sockopt

The socket option for which the getsockopt() failed. The field has one of the following values:

• SO\_SNDBUF – The syslogd client was attempting to get the TCP send buffer size. The failure occurred when syslogd was setting up a TCP connection with a remote syslogd server.

#### hostname

Hostname of the syslogd server to which the local syslogd is configured to connect. If the hostname is unknown, the value is N/A. The hostname might be unknown if the configured destination is an IP address.

#### ipaddr

IP address of the syslogd server to which the local syslogd is configured to connect.

#### portnum

Port number of the syslogd server to which the local syslogd is configured to connect.

#### error\_description

Describes the meaning of errno.

#### errno

The z/OS UNIX System Service return code. These return codes are listed and described in <u>Chapter 2</u>, <u>"Return codes (errnos)," on page 939</u> in z/OS UNIX System Services Messages and Codes.

#### reason\_code

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the <u>Chapter 3</u>, "Reason codes (errnojrs)," on page 943 information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

## System action

Processing continues. Syslogd does not attempt to set the send buffer size for the socket, but the socket/connection set up continues.

### **Operator response**

Save the log file where this message is written and contact the system programmer.

#### System programmer response

Use the return code information to determine the cause of the getsockopt() failure.

FSUM1302 getsockopt SO\_SNDBUF (www.example.com 192.168.1.9 6514): EDC5118I Incorrect address. Errno/Rsn=118/0F02012E

#### **FSUM1303**

#### recv tcp message error (hostname ipaddr portnum): reason

#### **Explanation**

The syslog daemon (syslogd) found an error while processing a message from a remote syslogd client over a TCP connection. The TCP connection is closed.

In the message text:

#### hostname

The hostname of the remote syslogd client that sent the log message. If the hostname is unknown, *hostname* is N/A.

#### ipaddr

The IP address of the remote syslogd client that sent the log message.

#### portnum

The port of the remote syslogd client that sent the log message.

#### reason

The reason syslogd was not able to process the message. The possible values are:

- unrecognized framing method Syslogd was not able to recognize the framing of the message. The first byte of the message was not an ASCII less-than sign (x'3C') indicating non-transparent framing or an ASCII digit in the range 0-9 (x'30' x'39') indicating octet-counting. Only octet-counting and non-transparent framing are supported.
- trailer character not found The message received was recognized as using non-transparent framing, but syslogd was not able to determine the end of the message. A trailer character was not found in the first

- 16,384 bytes of data. The ASCII trailer characters supported by the z/OS syslogd are: LF (x'0A'), NUL (x'00'), and CRLF (x'0D0A').
- message length not valid The message received was recognized as using octet-counting framing but the message length at the beginning of the message was not valid. The message length can be up to 5 digits long and must be followed by a space.

## **System action**

Processing continues. z/OS syslogd closes the TCP connection with the remote client. The TCP inbound thread associated with the connection becomes available for a new connection.

## **Operator response**

Save the log file where syslogd error messages are written and contact the system programmer. The log file can be determined by reviewing the syslogd configuration file.

## System programmer response

Configure the remote client to use octet-counting framing if it is supported. If the remote client only supports non-transparent framing, ensure that the remote client is configured to use one of the following ASCII trailer characters to indicate the end of the message: LF (x'0A'), NUL (x'00'), or CRLF (x'0DOA').

Refer to RFC 6587 Transmission of Syslog Messages over TCP which describes both framing methods.

If you continue to receive FSUM1303 error messages after ensuring that the remote client is configured correctly, contact the IBM Support Center and provide the file that contains the syslogd error messages.

## User response

No action is needed.

#### **Problem determination**

## **Example**

```
FSUM1303 recv tcp message error (remote.client1.com 192.168.2.1 14321): unrecognized framing method FSUM1303 recv tcp message error (remote.client1.com 192.168.2.1 14323): trailer character not found FSUM1303 recv tcp message error (remote.client3.com 192.168.2.0 14324): message length not valid
```

#### **FSUM2001I**

Command system error+
There is not enough virtual storage
to run the command. Function
= IKJPARS, return code =
return-code

## **Explanation**

The OMVS command invoked the TSO/E parse service routine (IKJPARS) to process the OMVS command options. IKJPARS failed with an error return code. The second-level TSO/E message indicates what error was reported by IKJPARS:

#### **FSUM2002I**

IKJPARS could not obtain required storage and issued return code 16.

#### **FSUM2003I**

IKJPARS detected an error and issued the return code displayed in the second-level TSO/E message.

In the message text:

#### return-code

The return code from the TSO/E IKJPARS service.

## **System action**

The OMVS command ends and returns to TSO/E without starting a shell session.

## System programmer response

If the second-level message is FSUM2002I, make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for the TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID.

If the second-level message is FSUM2003I, see <u>z/OS TSO/E Programming Services</u> for more information on this error from IKJPARS. If any other messages appeared along with the error, follow the suggested actions for those messages.

#### User response

If the second-level TSO/E message is FSUM2002I, the OMVS command requires more storage than is currently available. To make more storage available, do one of the following:

- Enter the OMVS command directly from the TSO/E READY prompt.
- Enter the OMVS command from a 3270 display with a smaller screen size.
- Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.

If the second-level TSO/E message is FSUM2003I, contact the system programmer with this message number and the IKJPARS return code displayed in the second-level TSO/E message.

### **FSUM2002I**

There is not enough virtual storage to run the command.

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2001I when you press "?". For more information, see FSUM2001I.

## **System action**

See message FSUM2001I.

## System programmer response

See message FSUM2001I.

### **User response**

See message FSUM2001I.

FSUM2003I

Function = IKJPARS, return code = return-code

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2001I when you press "?". For more information, see FSUM2001I.

## **System action**

See message FSUM2001I.

## System programmer response

See message FSUM2001I.

### **User response**

See message FSUM2001I.

**FSUM2004I** 

The OMVS command could not open the character conversion library.+ Return code = return-code

### **Explanation**

The OMVS command tried to open the data set containing the character conversion table. OPEN failed with the return code displayed in the second-level TSO/E message.

Other error messages explaining why OPEN failed may appear along with this message.

In the message text:

#### return-code

The return code from OPEN.

#### **System action**

The OMVS command ends and returns to TSO/E without starting a shell session. Additional error messages may appear if you entered the TSO/E PROFILE WTPMSG command.

### System programmer response

For more information about error return codes from OPEN, see  $\underline{z/OS}$  DFSMS Macro Instructions for Data Sets. If any other error messages appeared along with this one, follow the suggested actions for those messages.

### User response

Contact the system programmer with the OPEN return code displayed in the second-level message.

FSUM2005I

Return code = return-code

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2004I when you press "?". For more information, see message FSUM2004I.

## System action

See message FSUM2004I.

## System programmer response

See message FSUM2004I.

## **User response**

See message FSUM2004I.

#### FSUM2006I

The OMVS command could not load the character conversion table.+ Module conversion-table-name could not be loaded from the system libraries. Module conversion-table-name could not be loaded from data set data-set-name.

## **Explanation**

The OMVS command could not load the character conversion table from the specified data set, or from the default system libraries.

Other error messages explaining why the MVS LOAD service failed may appear along with this message.

In the message text:

#### conversion-table-name

The name of the character conversion table that could not be loaded.

#### data-set-name

The name of the data set that should have contained the character conversion table.

### System action

The OMVS command ends and returns to TSO/E, without starting a shell session. Additional error messages may appear if you had entered the TSO/E PROFILE WTPMSG command.

#### System programmer response

If other error messages appeared with this one, follow the suggested actions for those messages.

### User response

Contact the system programmer with the error message number and any variable information provided by the second-level TSO/E message.

### FSUM2007I

Module *conversion-table-name* could not be loaded from the system libraries.

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2006I when you press "?". For more information see FSUM2006I.

## System action

See message FSUM2006I.

## System programmer response

See message FSUM2006I.

### **User response**

See message FSUM2006I.

FSUM2008I

Module *conversion-table-name* could not be loaded from data set *data-set-name*.

### **Explanation**

This is a TSO/E secondary message that appears following FSUM2006I when you press "?". For more information see FSUM2006I.

## System action

See message FSUM2006I.

## System programmer response

See message FSUM2006I.

### **User response**

See message FSUM2006I.

FSUM2009I

The OMVS command could not close the character conversion library.+
Return code = return-code

### **Explanation**

The OMVS command tried to close the data set containing the character conversion table, but failed with the return code displayed in the second-level TSO/E message.

Other error messages explaining why CLOSE failed may appear along with this message.

In the message text:

#### return-code

The return code from CLOSE.

#### **System action**

The OMVS command ends and returns to TSO/E, without starting a shell session.

### System programmer response

For more information about error return codes from CLOSE, see z/OS DFSMS Macro Instructions for Data Sets.

#### **User response**

Contact the system programmer with the CLOSE return code displayed in the second-level message.

**FSUM2010I** 

Return code = return-code

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2009I when you press "?". For more information see FSUM2009I.

## **System action**

See message FSUM2009I.

## System programmer response

See message FSUM2009I.

## **User response**

See message FSUM2009I.

#### **FSUM2011I**

The OMVS command could not delete the character conversion table.+ Module conversion-table-name could not be deleted.

## **Explanation**

The OMVS command could not delete the character conversion table that was loaded from the specified data set or from the default system libraries.

Other error messages explaining why DELETE failed may appear along with this message.

In the message text:

#### conversion-table-name

The name of the character conversion table that could not be deleted.

## **System action**

The OMVS command ends and returns to TSO/E. The character conversion tables may still be loaded in system storage.

### **System programmer response**

If other error messages appeared with this one, follow the suggested actions for those messages.

## **User response**

Contact the system programmer with the error message number and any variable information provided by the second-level TSO/E message.

### **FSUM2012I**

Module conversion-table-name could not be deleted.

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2011I when you press "?". For more information see FSUM2011I.

## **System action**

See message FSUM2011I.

## System programmer response

See message FSUM2011I.

## **User response**

See message FSUM2011I.

#### **FSUM2013I**

#### The OMVS command ended in error.+ OMVS return code = return-code

### **Explanation**

The OMVS command ended because of an error. Other error messages that explain the failure should appear with this message.

In the message text:

#### return-code

The return code from the C-language portion of the OMVS command, or the runtime library. This is not the return code from the OMVS command returned to a TSO/E CLIST.

The return codes are:

#### 12

An unrecoverable error caused the OMVS command to end. Prior error messages should describe the error.

#### 16

An unexpected error caused the OMVS command to end. Message FSUM2141I, which should appear prior to this message, describes the unexpected error.

#### 100

An internal error caused the OMVS command to end. Message FSUM2145I, which should appear prior to this message, describes the internal error.

#### 111

An internal error caused the OMVS command to end.

#### 112

An internal error caused the OMVS command to end.

#### 113

An internal error caused the OMVS command to end.

#### 200

SIGILL, SIGSEGV, SIGFPE, or SIGABND caused the OMVS command to end.

#### 211

SIGILL, SIGSEGV, SIGFPE, or SIGABND caused the OMVS command to end abruptly, perhaps without the usual error messages.

#### Other

A return code issued from the runtime library. For more information about this return code, see z/OS XL C/C++ User's Guide.

## **System action**

The OMVS command ends in error and returns to TSO/E.

## System programmer response

Follow the recommended actions for the earlier error messages that describe the error.

#### User response

Follow the recommended actions for the earlier error messages that describe the error. Contact the system programmer, if needed.

#### FSUM2014I

**OMVS** return code = return-code

### **Explanation**

This is a TSO/E secondary message that appears following FSUM2013I when you press "?". For more information see FSUM2013I.

## **System action**

See message FSUM2013I.

### System programmer response

See message FSUM2013I.

## **User response**

See message FSUM2013I.

#### **FSUM2016I**

An unexpected error occurred. Error code = error-code, return code = return-code-decimal (X'return-code-hex'), abend code = abend-code, reason code = reason-code, error data = error-data, error string = 'error-string' Error code = error-code, return value = return-value, erron = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message' Error code = error-code

## **Explanation**

The OMVS command detected an error, probably in the OMVS command or the message catalog.

In the message text:

#### error-code

The code for this error.

#### return-code-decimal

The return code, in decimal, associated with this error. If this value is zero, there is no return code for this error.

#### return-code-hex

The return code, in hexadecimal, associated with this error. If this value is zero, there is no return code for this error.

#### abend-code

An abend code associated with this error. If this value is zero, there is no abend code for this error.

#### reason-code

A reason code associated with this error. If this value is zero, there is no reason code available for this error.

#### error-data

Additional data associated with this error. If this value is zero, there is no additional data for this error.

#### error-string

A string of characters that provides additional error information. If this string is empty, no error string is available for this error.

#### return-value

The return value associated with this error. If this value is zero, there is no return value available for this error.

#### errno-decimal

The errno value, in decimal, for this error. If this value is zero, there is no errno available for this error.

#### errno-hex

The errno value, in hexadecimal, for this error.

#### system-message

The system message corresponding to the returned errno value. If errno is zero, this message is not meaningful.

## System action

The OMVS command continues processing after reporting the error.

## System programmer response

Report the problem to the IBM support center.

### **User response**

Contact the system programmer with this message number and the displayed error information from the second-level TSO/E message.

FSUM2017I	Error code = error-code, return code = return-code-decimal (X'return-
	code-hex¹), abend code = αbend-code, reason code = reason-code, error
	data = error-data, error string = 'error-string'

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2016I when you press "?". For more information see FSUM2016I.

### **System action**

See message FSUM2016I.

## System programmer response

See message FSUM2016I.

#### **User response**

See message FSUM2016I.

FSUM2018I	Error code = error-code,	
	return value = <i>return-value</i> ,	
	errno = errno-decimal (X'errno-hex'),	
	reason code = reαson-code,	
	description = 'system-message'	

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2016I when you press "?". For more information see FSUM2016I.

### **System action**

See message FSUM2016I.

## System programmer response

See message FSUM2016I.

### **User response**

See message FSUM2016I.

FSUM2019I

Error code = error-code

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2016I when you press "?". For more information see FSUM2016I.

## **System action**

See message FSUM2016I.

## System programmer response

See message FSUM2016I.

### **User response**

See message FSUM2016I.

#### **FSUM2020I**

No session was started. Not enough storage is available. Function =

malloc(),

bytes required = malloc-bytes, return value = return-value

### **Explanation**

The OMVS command was unable to get the storage required to start a new session. The second-level TSO/E message gives the number of bytes of storage required.

In the message text:

#### malloc-bytes

The number of bytes that could not be obtained by the malloc() function.

#### return-value

The return value from the failing malloc() function.

#### **System action**

The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

### System programmer response

Make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for this TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID.

## **User response**

The OMVS command requires more storage than is currently available. To make more storage available:

- Enter the OMVS command directly from the TSO/E READY prompt.
- Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.

To reduce the OMVS storage requirement:

- Do not try to start so many sessions.
- Enter the OMVS command from a 3270 display with a smaller screen size.
- If the LINES(n) option was used, specify a smaller value for n.

#### **FSUM2021I**

Function = malloc(), bytes required = *malloc-bytes*, return value = *return-value* 

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2020I when you press "?". For more information see FSUM2020I.

## **System action**

See message FSUM2020I.

## System programmer response

See message FSUM2020I.

### User response

See message FSUM2020I.

#### **FSUM2022I**

Special characters may appear incorrect on the terminal. OMVS cannot use the codeset in the character conversion table.+ Function = setlocale(), codeset name = 'codeset-name', return value = return-value

### **Explanation**

The TSO/E OMVS command recognized the codeset name in the character conversion table, but was unable to switch to any of the known locales that use the codeset. The setlocale() function failed for all known locales that use the specified codeset.

Data sets for one or more of the locales that use the codeset are probably not available on the system. For more information about the C/370 locale data sets, see z/OS XL C/C++ Programming Guide.

In the message text:

#### codeset-name

The name of the codeset specified in the character conversion table.

#### return-value

The return value from setlocale().

### **System action**

The OMVS command continues. Characters in error messages and the help panel will not be converted from code page 1047 to the correct 3270 code page before they are written to the terminal. Certain special characters may appear incorrect on the 3270 screen.

### System programmer response

If an IBM-provided character conversion table was being used, make sure that the required locale data sets are available on the system.

If the failure occurred when trying to use a customized table, make sure that the codeset name in the character conversion table is correct, and that all required locale data sets are available on the system.

## **User response**

If the CONVERT keyword on the OMVS command was used to override the default character conversion table, specify a different table. If the correct table was specified, contact the system programmer.

If the default character conversion table was used, contact the system programmer.

FSUM2023I

Function = setlocale(), codeset name = 'codeset-name', return value = return-value

### **Explanation**

This is a TSO/E secondary message that appears following FSUM2022I when you press "?". For more information see FSUM2022I.

## System action

See message FSUM2022I.

## System programmer response

See message FSUM2022I.

## User response

See message FSUM2022I.

#### **FSUM2024I**

Special characters may appear incorrect on the terminal. OMVS cannot use the locale in the character conversion table.+ Function = setlocale(), locale name = 'locale-name'', return value = return-value

## **Explanation**

The TSO/E OMVS command was unable to switch to the locale specified in the character conversion table. The setlocale() function failed with the displayed return value. This error happens only when using customized character conversion tables, which specify a locale name rather than just the codeset name.

The locale name may be incorrect, or data sets for the locale may not be available on the system. For more information about C/370 locale data sets, see z/OS XL C/C++ Programming Guide.

In the message text:

#### locale-name

The name of the locale specified in the character conversion table.

#### return-value

The return value from setlocale().

### System action

The OMVS command continues. Characters in error messages and the help panel will not be converted from code page 1047 to the correct 3270 code page before they are written to the terminal. Certain special characters may appear incorrect on the 3270 screen.

## System programmer response

This error normally occurs only when using customized character conversion tables. Make sure that the locale name specified in the character conversion table is correct. Make sure that all data sets for that locale are available on the system.

### **User response**

If the CONVERT keyword on the OMVS command was used to override the default character conversion table, specify a different table. If the correct table was specified, contact the system programmer.

If the default character conversion table was used, contact the system programmer.

FSUM2025I

Function = setlocale(), locale name = 'locale-name'', return value = return-value

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2024I when you press "?". For more information see FSUM2024I.

## **System action**

See message FSUM2024I.

## System programmer response

See message FSUM2024I.

## **User response**

See message FSUM2024I.

#### **FSUM2026I**

No session was started. The shell cannot start, because too many processes are already active for this UID. Function = attach\_exec, return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

### **Explanation**

When you entered the TSO/E OMVS command or OPEN subcommand, close to the maximum number of processes were already active for this UID. Because of this, the process required for the shell could not be created. At least two processes must be available for this UID when you run the TSO/E OMVS command. Also, at least one process must be available for this UID when you run the OPEN subcommand. Each shell session takes up at least one process for this UID. Active z/OS UNIX batch jobs submitted for this TSO/E user ID count as processes for this UID. Other TSO/E user IDs may share the same UID with this TSO/E user ID. If those user IDs are currently using z/OS UNIX, their processes also count toward the maximum allowed for this UID.

In the message text:

#### return-value

The return value from attach\_exec.

#### errno-decimal

The errno value, in decimal, returned from attach\_exec.

#### errno-hex

The errno value, in hexadecimal, returned from attach\_exec.

#### **FSUM** messages

#### reason-code

The reason code returned from attach\_exec.

#### system-message

The system message corresponding to the returned errno value.

## **System action**

The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

## System programmer response

If required, increase the maximum number of processes allowed for a UID. This number is specified in the BPXPRMxx parmlib member for z/OS UNIX. For information about configuring BPXPRMxx, see <u>Customizing BPXPRMxx</u> for a shared file system in z/OS UNIX System Services Planning.

For an explanation of the errno and reason code from attach\_exec, see <u>z/OS UNIX System Services</u>

<u>Programming: Assembler Callable Services Reference</u>. Follow any suggested actions for this errno value and reason code.

## **User response**

Try not to start so many shell sessions. Specify fewer initial sessions on the TSO/E OMVS command.

Wait for any z/OS UNIX batch jobs from this TSO/E user ID to end before reentering the OMVS command or OPEN subcommand. Other TSO/E user IDs may share a common UID with this user ID. Reenter the OMVS command or OPEN subcommand after one of those TSO/E user IDs has finished using z/OS UNIX.

Ask the system programmer to increase the maximum number of processes allowed per UID.

### **FSUM2027I**

Function = attach\_exec, return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

### **Explanation**

This is a TSO/E secondary message that appears following FSUM2026I when you press "?". For more information see FSUM2026I.

## **System action**

See message FSUM2026I.

#### **System programmer response**

See message FSUM2026I.

#### **User response**

See message FSUM2026I.

## FSUM2028I

No session was started. The shell cannot start, because too many processes are already active in the system. Function = attach\_exec, return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code,

#### description = 'system-message'

## **Explanation**

When you entered the TSO/E OMVS command or OPEN subcommand, close to the maximum number of processes were already active in the system. Because of this, the process required for the shell could not be created. The system must be able to start at least two more processes before the TSO/E OMVS command can run. The system must be able to start at least one more process before the OPEN subcommand can run.

In the message text:

#### return-value

The return value from attach\_exec.

#### errno-decimal

The errno value, in decimal, returned from attach\_exec.

#### errno-hex

The errno value, in hexadecimal, returned from attach\_exec.

#### reason-code

The reason code returned from attach\_exec.

#### system-message

The system message corresponding to the returned errno value.

## System action

The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

## System programmer response

If required, increase the maximum number of processes allowed for z/OS UNIX. This number is specified in the BPXPRMxx parmlib member for z/OS UNIX. For information about configuring BPXPRMxx, see <u>Customizing BPXPRMxx</u> for a shared file system in z/OS UNIX System Services Planning.

For an explanation of the errno and reason code from attach\_exec, see <u>z/OS UNIX System Services</u>

<u>Programming: Assembler Callable Services Reference</u>. Follow any suggested actions for this errno value and reason code.

## **User response**

Try not to start so many shell sessions. Specify fewer initial sessions on the TSO/E OMVS command.

Retry the TSO/E OMVS command or OPEN subcommand later, when the system is not so busy.

Ask the system programmer to increase the maximum number processes that can be active at one time.

FSUM2029I

Function = attach\_exec, return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

#### **Explanation**

This is a TSO/E secondary message that appears following FSUM2028I when you press "?". For more information see FSUM2028I.

## **System action**

See message FSUM2028I.

## System programmer response

See message FSUM2028I.

### **User response**

See message FSUM2028I.

#### FSUM2030I

One or more DBCS characters were found in the TSO/E OMVS command ESCAPE operand string. These DBCS characters are ignored.

## **Explanation**

One or more DBCS characters or a Shift Out (SO) character were specified in the TSO/E OMVS command ESCAPE operand. However, only SBCS characters may be used as escape characters. OMVS cannot use DBCS escape characters.

## **System action**

The OMVS command continues processing. None of the DBCS characters in the ESCAPE operand string are treated as escape characters. Any valid SBCS characters in the string are used as escape characters. The accepted escape characters appear at the bottom of the OMVS screen.

## System programmer response

Make sure that any CLISTs or REXX EXECs that invoke OMVS do not specify DBCS characters in the TSO/E OMVS command ESCAPE operand.

## **User response**

Specify only SBCS characters in the OMVS command ESCAPE operand string. Do not specify any DBCS escape characters.

#### **FSUM2031I**

The OMVS command could not start, because not enough storage was available.

### **Explanation**

During OMVS command processing, a request for storage failed. There was not enough storage to issue a more detailed error message that would describe the failing storage request.

## **System action**

The OMVS command ends and returns to TSO/E without starting a shell session.

### System programmer response

Make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for the TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID.

### **User response**

The OMVS command requires more storage than is currently available. To make more storage available, do one of the following:

- Enter the OMVS command directly from the TSO/E READY prompt.
- Enter the OMVS command from a 3270 display with a smaller screen size.
- Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.

#### **FSUM2032I**

The OMVS command failed because it could not obtain required

storage. Function = malloc(),
bytes required = malloc-bytes,
return value = return-value
Function = GETMAIN
(below 16 megabytes),
bytes required = bytes-below-16mb,
return code = return-code
Function = GETMAIN,
bytes required = bytes-anywhere,
return code = return-code

return code = return-code
Function = GETMAIN (subpool 1),
bytes required = subpool-1-bytes,
return code = return-code
Function = GETMAIN
(below 16 megabytes),

bytes required = 72

## **Explanation**

During OMVS command processing, a request for storage failed. The second-level TSO/E message gives the type of storage request that failed, and the number of bytes requested.

In the message text:

#### malloc-bytes

The number of bytes that could not be obtained by the malloc() function.

#### return-value

The return value from the failing malloc() function.

#### bytes-below-16mb

The number of bytes of storage required below the 16MB address.

#### return-code

The return code from the failing GETMAIN request.

#### bytes-anywhere

The number of bytes of storage required above or below the 16MB address.

#### subpool-1-bytes

The number of bytes of storage required in subpool 1.

## **System action**

The OMVS command ends and returns to TSO/E.

#### System programmer response

Make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for this TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID.

The second-level TSO/E message indicates what type of storage ran out:

#### FSUM2033I

Not enough storage to satisfy a malloc() request.

#### **FSUM2034I**

Not enough storage below the 16MB address.

#### **FSUM2035I**

Not enough storage above or below the 16MB address

#### **FSUM2036I**

Not enough storage to satisfy a GETMAIN request for subpool 1 storage.

#### **FSUM** messages

#### **FSUM2064I**

Not enough storage below the 16MB address (storage is required for the OMVS command with TCLEARQ).

#### **FSUM2065I**

Not enough storage below the 16MB address (storage is required for the OMVS command with STFSMODE ON).

#### **FSUM2066I**

Not enough storage below the 16MB address (storage is required for the OMVS command with STFSMODE OFF).

#### **FSUM2067I**

Not enough storage below the 16MB address (storage is required for the OMVS command with STTMPMD ON).

#### **FSUM2068I**

Not enough storage below the 16MB address (storage is required for the OMVS command with STTMPMD OFF).

#### **FSUM2069I**

Not enough storage below the 16MB address (storage is required for the OMVS command with STLINENO).

## **User response**

The OMVS command requires more storage than is currently available. To make more storage available:

- Enter the OMVS command directly from the TSO/E READY prompt.
- Enter the OMVS command from a 3270 display with a smaller screen size.
- Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.

#### **FSUM2033I**

Function = malloc(), bytes required = *malloc-bytes*, return value = return-value

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2032I when you press "?". For more information, see FSUM2032I.

### System action

See message FSUM2032I.

#### System programmer response

See message FSUM2032I.

#### **User response**

See message FSUM2032I.

## FSUM2034I

Function = GETMAIN (below 16 megabytes), bytes required = bytes-below-16mb, return code = return-code

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2032I when you press "?". For more information, see FSUM2032I.

## System action

See message FSUM2032I.

**264** z/OS: z/OS UNIX System Services Messages and Codes

## System programmer response

See message FSUM2032I.

### **User response**

See message FSUM2032I.

FSUM2035I

Function = GETMAIN, bytes required = bytes-anywhere, return code = return-code

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2032I when you press "?". For more information, see FSUM2032I.

## **System action**

See message FSUM2032I.

## System programmer response

See message FSUM2032I.

## **User response**

See message FSUM2032I.

FSUM2036I

Function = GETMAIN (subpool 1), bytes required = *subpool-1-bytes*, return code = *return-code* 

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2032I when you press "?". For more information, see FSUM2032I.

## **System action**

See message FSUM2032I.

#### System programmer response

See message FSUM2032I.

#### **User response**

See message FSUM2032I.

FSUM2037I

The OMVS debug data set could not be opened. Debug information will not be recorded. Function = fopen(), errno = errno-decimal(X'errno-hex'), reason code = reason-code, description = 'system-message'

### **Explanation**

The DEBUG option was specified on the OMVS command when it was entered. The OMVS command tries to record debug data in the data set with a DDNAME of SYSFSUMO. The OMVS command was unable to use this data set.

#### **FSUM** messages

The errno, reason code, and system message displayed in the second-level TSO/E message may explain more about this error. More information about the errno value and system message can be found in <u>z/OS C/C++</u>
<u>Runtime Library Reference</u>. If the reason code is not zero, more information can be found in <u>z/OS UNIX System</u>
<u>Services Programming</u>: Assembler Callable Services Reference.

In the message text:

#### errno-decimal

The errno value, in decimal, returned from fopen().

#### errno-hex

The errno value, in hexadecimal, returned from fopen().

#### reason-code

The reason code returned from fopen().

### system-message

The system message corresponding to the returned errno value.

## System action

The OMVS command continues processing but does not record any debug data. Additional error messages may appear if you entered the TSO/E PROFILE WTPMSG command.

## System programmer response

If you need to collect debugging information from the OMVS command, make sure that the SYSFSUMO debug data set is available to the OMVS command. If the WRAPDEBUG(n) option is not used, this data set should have room for at least 10,000 80-byte fixed-length records. If the WRAPDEBUG(n) option is used, this data set should have room for at least n 80-byte fixed-length records.

## **User response**

If you were directed to collect debugging information from the OMVS command, a debug data set is required. If WRAPDEBUG(n) is used, create a data set with room for at least n 80-byte fixed-length records. If WRAPDEBUG(n) is not used, create a data set with room for at least 10,000 80-byte fixed-length records. Use the TSO/E ALLOCATE command to allocate this data set to SYSFSUMO. For example, ALLOCATE FILE(SYSFSUMO) DATASET(XXX). Do not direct the debugging data to the terminal using DATASET(\*) on the ALLOCATE command, because you will prevent the OMVS command from using the display screen. Retry the OMVS command after setting up the debug data set.

If you do not want to record OMVS command debugging data, omit the DEBUG option from the OMVS command, or specify OMVS DEBUG(NO).

#### **FSUM2038I**

Function = fopen(), errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2037I when you press "?". For more information, see FSUM2037I.

## **System action**

See message FSUM2037I.

#### System programmer response

See message FSUM2037I.

## **User response**

See message FSUM2037I.

#### FSUM2039I

The OMVS character conversion table defines one or more DBCS characters as escape characters. These DBCS characters are ignored.

## **Explanation**

The OMVS character conversion table defines one or more DBCS characters or a Shift Out (SO) character as a default escape character. However, only SBCS characters can be defined as escape characters. OMVS cannot use DBCS escape characters.

## **System action**

The OMVS command continues processing. None of the DBCS characters in the character conversion table are treated as escape characters. Any valid SBCS characters in the table are used as escape characters. The accepted escape characters appear at the bottom of the OMVS screen.

## **System programmer response**

Make sure that any character conversion tables created for the TSO/E OMVS command define only SBCS characters as escape characters.

## **User response**

If OMVS is not using any escape characters, or if the accepted SBCS escape characters are not sufficient, end OMVS and return to TSO/E.

- Rerun the TSO/E OMVS command using the ESCAPE operand to override the bad default escape characters from the character conversion table. Specify only SBCS characters in the ESCAPE operand.
- Rerun the TSO/E OMVS command using the CONVERT operand to choose a different character conversion table.

Report the problem to the system programmer. Along with the message number, include any operands specified on the TSO/E OMVS command when the error occurred.

#### **FSUM2040I**

The OMVS command failed because the specified character conversion table contains ASCII characters.

### **Explanation**

The character conversion table specified on the OMVS command is not usable. The specified table converts between ASCII and EBCDIC characters. The OMVS command cannot use a conversion table that performs this conversion.

## **System action**

The OMVS command ends and returns to TSO/E, without starting a shell session.

## System programmer response

Make sure that any character conversion tables that are provided for use with the OMVS command do not convert to or from ASCII. If this error message appeared when the CONVERT keyword was not specified on the OMVS command, make sure the default table for the OMVS command does not convert to and from ASCII.

### **User response**

If the CONVERT keyword on the OMVS command was used to override the default character conversion table name, specify a different table. The table must not perform ASCII to EBCDIC conversion. If the CONVERT keyword was not used, contact the system programmer.

#### **FSUM2041I**

The OMVS command could not start, because module *module-name* could not be loaded.+ Abend code = Sabend-code, reason code = reason-code

## **Explanation**

The OMVS command tried to load the module named in the error message. The MVS LOAD service failed with the abend code and reason code displayed in the second-level TSO/E message. For more information about this abend code and reason code, see *z/OS MVS System Codes*.

In the message text:

#### module-name

The name of the load module that could not be loaded.

#### abend-code

The system abend code from the LOAD function.

#### reason-code

The abend reason code from the LOAD function.

## **System action**

The OMVS command ends and returns to TSO/E without starting a shell session.

## System programmer response

Make sure that the module named in the error message can be loaded by the OMVS command from the normal system libraries. Follow the suggested actions for the abend code and reason code displayed in the message.

## **User response**

Report this message number and the displayed module name, abend code, and reason code to the system programmer.

### **FSUM2042I**

Abend code = Sabend-code, reason code = reason-code

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2041I when you press "?". For more information, see FSUM2041I.

## **System action**

See message FSUM2041I.

### System programmer response

See message FSUM2041I.

#### **User response**

See message FSUM2041I.

#### **FSUM2043I**

The OMVS command failed because the specified character conversion table is not the correct size.+ The required size is *required-size* bytes, but the actual size is *actual-size* bytes (decimal).

## **Explanation**

The length of the character conversion table specified on the OMVS command is incorrect. The OMVS command requires tables of a certain length. If the CONVERT keyword was used to override the default character conversion table name, the specified name is probably not the name of a character conversion table. If the specified name is correct, the table was probably not built correctly.

In the message text:

#### required-size

The required length for character conversion tables used by the OMVS command.

#### actual-size

The actual length of the character conversion table that was loaded.

## **System action**

The OMVS command ends and returns to TSO/E, without starting a shell session.

## System programmer response

Make sure that all character conversion tables for the OMVS command are exactly the required length. If this error message appeared when the CONVERT keyword was not specified on the OMVS command, make sure the default table is the correct length.

## **User response**

If the CONVERT keyword on the OMVS command was used to override the default character conversion table, make sure that the specified data set really is a character conversion table, or use the CONVERT keyword to choose a different table. If the CONVERT keyword was not used, contact the system programmer.

#### **FSUM2044I**

The required size is *required-size* bytes, but the actual size is *actual-size* bytes (decimal).

### **Explanation**

This is a TSO/E secondary message that appears following FSUM2043I when you press "?". For more information see FSUM2043I.

### **System action**

See message FSUM2043I.

#### System programmer response

See message FSUM2043I.

#### **User response**

See message FSUM2043I.

## FSUM2045I

The OMVS command failed because data in the specified character conversion table is incorrect.+ The eyecatcher field must be 'required-eyecatcher' (X'required-eyecatcher-hex') but is actually X'actual-eyecatcher-hex'.

## **Explanation**

The eyecatcher field in the character conversion table specified on the OMVS command is incorrect. The OMVS command requires the correct eyecatcher field in all tables used. If the CONVERT keyword was used to override the default table name, the specified name is probably not the name of a character conversion table. If the specified name is correct, the table was probably not built correctly.

In the message text:

#### required-eyecatcher

The EBCDIC data that is required in the eyecatcher field of character conversion tables used by the OMVS command.

#### required-eyecatcher-hex

The hexadecimal data that is required in the eyecatcher field of character conversion tables used by the OMVS command.

## actual-eyecatcher-hex

The hexadecimal data that is actually present in the eyecatcher field of the specified character conversion table.

## **System action**

The OMVS command ends and returns to TSO/E, without starting a shell session.

## System programmer response

Make sure that the eyecatcher field is correct in all character conversion tables for the OMVS command. If this error message appeared when the CONVERT keyword was not specified on the OMVS command, make sure the eyecatcher field in the default table is correct.

## **User response**

If the CONVERT keyword on the OMVS command was used to override the default table, make sure that the specified data set really is a character conversion table, or use the CONVERT keyword to choose a different table. If the CONVERT keyword was not used, contact the system programmer.

**FSUM2046I** 

The eyecatcher field must be 'required-eyecatcher' (X'required-eyecatcher-hex') but is actually X'actual-eyecatcher-hex'.

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2045I when you press "?". For more information see FSUM2045I.

## **System action**

See message FSUM2045I.

## System programmer response

See message FSUM2045I.

#### **User response**

See message FSUM2045I.

#### **FSUM2047I**

The OMVS command failed because the specified character conversion table is the wrong version.+ Version *required-version* is required, but the actual version is *actual-version*.

## **Explanation**

The version of the character conversion table specified on the OMVS command is incorrect. The OMVS command requires a different version of the table. If the CONVERT keyword was used to override the default table name, the specified data might not be a character conversion table.

In the message text:

## required-version

The version of the character conversion table required by the OMVS command.

#### actual-version

The version number contained inside the loaded character conversion table.

## **System action**

The OMVS command ends and returns to TSO/E, without starting a shell session.

## **System programmer response**

Make sure that all character conversion tables that are provided for the OMVS command contain the correct version number. If this error message appeared when the CONVERT keyword was not specified on the OMVS command, make sure the version of the default table is correct.

## **User response**

If the CONVERT keyword on the OMVS command was used to override the default character conversion table name, use a different table, or specify a different library. Make sure that the data set name specified is really the name of a character conversion table, or use the CONVERT keyword to choose a different table. If the CONVERT keyword was not used, contact the system programmer.

FSUM2048I

Version *required-version* is required, but the actual version is *actual-version*.

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2047I when you press "?". For more information, see FSUM2047I.

## System action

See message FSUM2047I.

#### System programmer response

See message FSUM2047I.

#### User response

See message FSUM2047I.

FSUM2049I

The OMVS command can be entered only from a display terminal.

## **Explanation**

You tried to invoke the OMVS command from a terminal that is not a display terminal. When the OMVS command tried to find out the screen size, it determined that the terminal was not a display. The OMVS command must be entered from a 3270-type display terminal, or from a workstation with a 3270 emulator.

## **System action**

The OMVS command ends and returns to TSO/E without starting a shell session.

## System programmer response

The terminal in use is not a display terminal. For more information, see return code 8 from the GTTERM macro, in z/OS TSO/E Programming Services.

## **User response**

Make sure that you are logged on to a display terminal before you enter the OMVS command. If you are logged on to a display terminal, contact the system programmer.

#### **FSUM2050I**

Special characters may appear incorrect on the terminal. The codeset ('codeset-name') in the character conversion table is unknown.

## **Explanation**

The codeset name in the character conversion table is not known to the TSO/E OMVS command. This error normally occurs only when using customized character conversion tables. The OMVS command was unable to construct a locale name for setlocale() from the unknown codeset name.

In the message text:

#### codeset-name

The name of the unknown codeset specified in the character conversion table.

## **System action**

The OMVS command continues. Characters in error messages and the help panel will not be converted from code page 1047 to the correct 3270 code page before they are written to the terminal. Certain special characters may appear incorrect on the 3270 screen.

### System programmer response

This error normally occurs only when using customized character conversion tables. If the customized table contains a codeset name, it must be a codeset used by a locale supported by OMVS.

If you need to use an installation-provided locale with the TSO/E OMVS command, specify the complete locale name ("Xx\_XX.YYY-9999") instead of the codeset name in the customized OMVS character conversion table.

## **User response**

If the CONVERT keyword on the OMVS command was used to override the default character conversion table, specify a different table. If the correct table was specified, contact the system programmer.

If the default character conversion table was used, contact the system programmer.

#### FSUM2051I

The OMVS command failed because the display screen size is not supported.+ The screen size must be at least *minimum-rows* by *minimum-columns* but less than *maximum-bytes* bytes total. The actual primary screen size is *primary-rows* by *primary-columns* (*primary-size* bytes). The alternate screen size is *alternate-rows* by *alternate-columns* (*alternate-size* bytes).

## **Explanation**

The available screen sizes for the terminal are too large or too small for the TSO/E OMVS command. The OMVS command is unable to use screens that are larger or smaller than the limits shown in the message text.

In the message text:

#### minimum-rows

The smallest number of rows allowed on a display screen supported by the OMVS command.

#### minimum-columns

The smallest number of columns allowed on a display screen supported by the OMVS command.

### maximum-bytes

The maximum number of characters (rows times columns) allowed on a display screen supported by the OMVS command.

#### primary-rows

The number of rows in the first screen size supported by the terminal.

#### primary-columns

The number of columns in the first screen size supported by the terminal.

#### primary-size

The number of bytes (rows times columns) for the first screen size supported by the terminal.

#### alternate-rows

The number of rows in the second or alternate screen size supported by the terminal.

#### alternate-columns

The number of columns in the second or alternate screen size supported by the terminal.

#### alternate-size

The number of bytes (rows times columns) for the second or alternate screen size supported by the terminal.

## **System action**

The OMVS command ends and returns to TSO/E, without starting a shell session.

## System programmer response

If the terminal does have a supported screen size, examine the actual screen size reported in the message. If the number of rows or columns is wrong in the message, the terminal may be reporting the wrong screen size to the system. The system could also be reporting the wrong screen size to the OMVS command. The OMVS command uses GTTERM to determine the screen size.

#### **User response**

Make sure that the OMVS command is entered only from terminals with supported screen sizes. Find another terminal, or use another emulator session with a supported screen size. If possible, reconfigure the terminal or emulator to a different screen size.

### **FSUM2052I**

The screen size must be at least *minimum-rows* by *minimum-columns* but less than *maximum-bytes* bytes total. The actual primary screen size is *primary-rows* by *primary-columns* (*primary-size* bytes). The alternate screen size is *alternate-rows* by *alternate-columns* (*alternate-size* bytes).

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2051I when you press "?". For more information, see FSUM2051I.

### System action

See message FSUM2051I.

#### System programmer response

See message FSUM2051I.

### **User response**

See message FSUM2051I.

#### FSUM2053I

The OMVS command failed because it could not obtain enough storage to determine the screen size.

## **Explanation**

The OMVS command requests 72 bytes of storage in order to determine the screen size. The request failed.

## **System action**

The OMVS command ends and returns to TSO/E, without starting a shell session.

## **System programmer response**

Make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for this TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID.

The failing GETMAIN request was for 72 bytes below the 16MB address.

## **User response**

The OMVS command requires more storage than is currently available. To make more storage available:

- Enter the OMVS command directly from the TSO/E READY prompt.
- Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.

#### **FSUM2054I**

The OMVS command can be entered only from a 3270-type terminal attached through VTAM°.

## **Explanation**

The OMVS command tries to put the TSO/E terminal into full-screen mode before displaying data from the shell session. The terminal could not be put into full-screen mode, because it is not a 3270-type terminal attached through VTAM.

### **System action**

The OMVS command ends and returns to TSO/E without starting a shell session.

#### System programmer response

The terminal must be a 3270-type terminal attached through VTAM. For more information, see return code 8 from the STFSMODE macro in *z/OS TSO/E Programming Services*.

### **User response**

Make sure you are using a 3270-type terminal or 3270 emulator when you enter the OMVS command. This terminal must be capable of running full-screen TSO/E commands, such as ISPF. If other full-screen commands work properly on this terminal, contact the system programmer.

FSUM2055I

The OMVS command cannot use the message catalog.Function = catopen(),
catalog name = 'catalog-name',
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,

### description = 'system-message'

# **Explanation**

The OMVS command tried to open the message catalog named in the second-level TSO/E message. This message catalog could not be opened. If the errno value is nonzero, you can find more information about this error in z/OS C/C++ Runtime Library Reference. The displayed reason code can be found in z/OS UNIX System Services Programming: Assembler Callable Services Reference and may help explain the cause of this error.

In the message text:

### catalog-name

The name of the message catalog that cannot be opened.

#### return-value

The return value from the system.

### errno-decimal

The errno value, in decimal, returned from the system; if errno is 0, no errno information is available for this error.

#### errno-hex

The errno value, in hexadecimal, returned from the system.

#### reason-code

The reason code from the system; if errno is 0, this reason code value may be incorrect.

### system-message

The system message corresponding to the returned errno value; if errno is 0, the displayed system message is not meaningful.

# **System action**

The OMVS command continues running after this error. However, the OMVS command screens might not contain the usual wording. Some OMVS subcommands may not be recognized. Some OMVS command error messages might not contain the usual wording.

# System programmer response

Make sure that the message catalog named in this error message is installed. Make sure that this user has read access to the message catalog. Make sure the user has search permission for all the directories leading to the message catalog.

# **User response**

Record the message number and the other information from the second-level TSO/E message. Contact the system programmer.

FSUM2056I

Function = catopen(),
catalog name = 'catalog-name',
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2055I when you press "?". For more information, see FSUM2055I.

# System action

See message FSUM2055I.

# System programmer response

See message FSUM2055I.

### **User response**

See message FSUM2055I.

#### FSUM2057I

No session was started. This TSO/E user ID does not have access to OpenMVS.Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

# **Explanation**

The RACF user profile for this TSO/E user ID does not contain the information needed to use z/OS UNIX.

In the message text:

#### return-value-hex

The return value from sigprocmask.

#### return-code

The return code, in hexadecimal, from sigprocmask.

#### reason-code

The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

# **System action**

The OMVS command ends and returns to TSO/E without starting a shell session.

### System programmer response

Give this TSO/E user ID access to z/OS UNIX, if required. For information about setting up user IDs for z/OS UNIX, see Defining z/OS UNIX users to RACF in z/OS UNIX System Services Planning.

To see other suggested actions for the displayed reason code and return code, refer to <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference.

### User response

Ask the system programmer to give this TSO/E user ID access to z/OS UNIX.

### **FSUM2058I**

Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

### **Explanation**

This is a TSO/E secondary message that appears following FSUM2057I when you press "?". For more information, see FSUM2057I.

# **System action**

See message FSUM2057I.

### System programmer response

See message FSUM2057I.

## **User response**

See message FSUM2057I.

FSUM2059I

No session was started. This TSO/E user ID is in a group that does not have access to OpenMVS.Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

# **Explanation**

This TSO/E user ID is a member of a RACF group. The RACF profile for that group does not contain information needed to use z/OS UNIX.

In the message text:

#### return-value-hex

The return value from sigprocmask.

#### return-code

The return code, in hexadecimal, from sigprocmask.

#### reason-code

The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

# System action

The OMVS command ends and returns to TSO/E without starting a shell session.

# System programmer response

Place this TSO/E user ID in a RACF group that can use z/OS UNIX, or allow the group currently containing this TSO/E user ID to use z/OS UNIX. For information about setting up user IDs and RACF groups for z/OS UNIX, see Defining z/OS UNIX users to RACF in z/OS UNIX System Services Planning.

To see other suggested actions for the displayed reason code and return code, refer to <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference.

### **User response**

Ask the system programmer to place this TSO/E user ID in a RACF group that can use z/OS UNIX.

**FSUM2060I** 

Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2059I when you press "?". For more information, see FSUM2059I.

# System action

See message FSUM2059I.

### **System programmer response**

See message FSUM2059I.

# **User response**

See message FSUM2059I.

#### **FSUM2061I**

The OMVS command could not write an informational message, because not enough storage was available.

# **Explanation**

The OMVS command tried to issue a TSO/E message. The message could not be displayed because there was not enough storage.

# System action

The OMVS command ends and returns to TSO/E. The shortage of storage may also prevent this message from showing up on the terminal.

# System programmer response

For more information, see return code 16 from the PUTLINE macro in z/OS TSO/E Programming Services.

Make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for the TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID.

# **User response**

The OMVS command requires more storage than is currently available. To make more storage available:

- Enter the OMVS command directly from the TSO/E READY prompt.
- Enter the OMVS command from a 3270 display with a smaller screen size.
- Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.

#### FSUM2062I

The OMVS command could not get the next input line, because the terminal was disconnected.

# **Explanation**

The OMVS command could not get the next line of input data from TSO/E, because the terminal was disconnected.

# **System action**

The OMVS command ends and returns to TSO/E. Because the terminal is disconnected, this error message will probably not show up on the screen.

### System programmer response

For more information, see return code 32 from the PUTGET macro in z/OS TSO/E Programming Services.

### User response

If the terminal is disconnected, log on to TSO/E, then reenter the OMVS command. If the terminal is not disconnected, contact the system programmer.

**FSUM2063I** 

The OMVS command could not write an informational message, because the terminal was disconnected.

The OMVS command could not write a TSO/E message to the terminal, because it was disconnected.

# System action

The OMVS command ends and returns to TSO/E. Because the terminal is disconnected, this error message will probably not show up on the screen.

# System programmer response

For more information, see return code 20 from IKJEFF02 and the PUTLINE macro in <u>z/OS TSO/E Programming</u> Services.

# **User response**

If the terminal is disconnected, log on to TSO/E, then reenter the OMVS command. If the terminal is not disconnected, contact the system programmer.

### FSUM2064I

Function = GETMAIN (below 16 megabytes), bytes required = 72

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2032I when you press "?". For more information, see FSUM2032I.

# System action

See message FSUM2032I.

# System programmer response

See message FSUM2032I.

# **User response**

See message FSUM2032I.

### **FSUM2065I**

Function = GETMAIN (below 16 megabytes), bytes required = 72

### **Explanation**

# System programmer response

See message FSUM2032I.

### User response

See message FSUM2032I.

#### FSUM2070I

Special characters may appear incorrect on the terminal. The length of the codeset string (*codeset-length*) in the character conversion table is too long.

# **Explanation**

The field containing the codeset name or locale name in the character conversion table is 64 bytes long. There is a separate length field in the table, which specifies the actual number of bytes used in the codeset name or locale name string. The specified string length was more than 64 bytes.

In the message text:

#### codeset-length

The length of the codeset string specified in the character conversion table.

# **System action**

The OMVS command continues. Characters in error messages and the help panel will not be converted from code page 1047 to the correct 3270 code page before they are written to the terminal. Certain special characters may appear incorrect on the 3270 screen.

# System programmer response

This error normally occurs only when using customized character conversion tables. Fix the length field in the customized table so that matches the number of characters in the codeset name or locale name string. The maximum possible length is 64 characters.

### **User response**

If the CONVERT keyword on the OMVS command was used to override the default character conversion table, specify a different table. If the correct table was specified, contact the system programmer.

If the default character conversion table was used, contact the system programmer.

**FSUM2071I** 

An error occurred while the OMVS command was writing to the debug data set. No more debug information will be recorded.+
Function = fwrite(),
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

The OMVS command was entered with the **DEBUG** option. The OMVS command was unable to write debugging information to the debug data set. This error may occur when the first data is written, or after some data has been written successfully.

In the message text:

#### return-value

The return value from the fwrite() function.

#### errno-decimal

The errno value, in decimal, returned from fwrite(). If errno is 0, no errno information is available for this error.

#### errno-hex

The errno value, in hexadecimal, returned from fwrite().

#### reason-code

The reason code returned from fwrite(); if errno is 0, this reason code value may be incorrect.

#### system-message

The system message corresponding to the returned errno value; if errno is 0, the displayed system message is not meaningful.

# **System action**

The OMVS command does not record any more debugging data in the debug data set. The OMVS command tries to close the debug data set, but continues all other processing normally.

# System programmer response

Make sure that the debug data set is set up properly. Follow any suggested actions for the errno or reason code displayed in the TSO/E second-level message.

For more information about the displayed errno value from the fwrite() function, see <u>z/OS C/C++ Runtime</u>
<u>Library Reference</u>. For information about the return code from the fwrite callable service, see <u>z/OS UNIX System</u>
<u>Services Programming: Assembler Callable Services Reference</u>.

# **User response**

If the debug data is important, end the shell session and return to TSO/E. Make sure that the debug data set is defined as a sequential data set with fixed-length 80-byte records. If WRAPDEBUG(n) is not used, make sure that the data set has enough room for at least 10,000 80-byte records. If WRAPDEBUG(n) is used, make sure that the data set has enough room for at least n 80-byte records. If nothing appears to be wrong with the debug data set definition, contact the system programmer.

### FSUM2072I

Function = fwrite(),
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2071I when you press "?". For more information, see FSUM2071I.

# **System action**

See message FSUM2071I.

# System programmer response

See message FSUM2071I.

### **User response**

See message FSUM2071I.

#### FSUM2073I

An error occurred while the OMVS command was closing the debug data set. Function = fclose(), return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

# **Explanation**

The OMVS command tried to close the debug data set. The debug data set is closed when the shell session returns to TSO/E. If message FSUM2071I also appeared, the debug data set was closed because of the write error.

In the message text:

#### return-value

The return value from the fclose() function.

#### errno-decimal

The errno value, in decimal, returned from fclose(); if errno is 0, no errno information is available for this error.

#### errno-hex

The errno value, in hexadecimal, returned from fclose().

#### reason-code

The reason code returned from fclose(); if errno is 0, this reason code value may be incorrect.

#### system-message

The system message corresponding to the returned errno value; if errno is 0, the displayed system message is not meaningful.

### System action

The OMVS command continues normal processing. The recorded debugging information in the data set might or might not be complete.

#### **System programmer response**

Make sure that the debug data set was set up properly. Follow any suggested actions for the errno or reason code displayed in the TSO/E second-level message.

For more information about the displayed errno value from the fclose() function, see <u>z/OS C/C++ Runtime</u> <u>Library Reference</u>. For more information about the return code from the fclose callable service, see <u>z/OS UNIX</u> System Services Programming: Assembler Callable Services Reference.

### **User response**

Contact the system programmer, with the data in the debug data set, and the information from the TSO/E second-level message.

FSUM2074I Function = fclose(),

return value = return-value,

errno = errno-decimal (X'errno-hex'),

reason code = reason-code,

### description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2073I when you press "?". For more information, see FSUM2073I.

# **System action**

See message FSUM2073I.

# System programmer response

See message FSUM2073I.

### **User response**

See message FSUM2073I.

**FSUM2075I** 

The OMVS command could not send output data, because the terminal was logged off and could not be reached.

# **Explanation**

The OMVS command could not write TSO/E full-screen data to the terminal, because it was logged off.

# **System action**

The OMVS command ends and returns to TSO/E. Because the terminal is logged off, this error message will probably not show up on the screen.

### System programmer response

For more information, see return code 20 from the TPUT macro in z/OS TSO/E Programming Services.

### **User response**

If the terminal is logged off, log on to TSO/E, then reenter the OMVS command. If the terminal is not logged off, contact the system programmer.

FSUM2076I

The OMVS command could not send output data to the terminal, because not enough storage was available.

### **Explanation**

The OMVS command could not send full-screen output data to the terminal, because there was not enough storage.

### System action

The OMVS command ends and returns to TSO/E. The shortage of shortage may also prevent this message from showing up on the terminal.

#### System programmer response

For more information, see return code 32 from the TPUT macro in z/OS TSO/E Programming Services.

Make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for the TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID.

# **User response**

The OMVS command requires more storage than is currently available. To make more storage available, do one of the following:

- Enter the OMVS command directly from the TSO/E READY prompt.
- Enter the OMVS command from a 3270 display with a smaller screen size.
- Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.

#### **FSUM2077I**

The OMVS command could not obtain input data, because the terminal was logged off and could not be reached.

# **Explanation**

The OMVS command could not obtain TSO/E full-screen data from the terminal, because it was logged off.

# **System action**

The OMVS command ends and returns to TSO/E. Because the terminal is logged off, this error message will probably not show up on the screen.

# System programmer response

For more information, see return code 20 from the TGET macro in z/OS TSO/E Programming Services.

# **User response**

If the terminal is logged off, log on to TSO/E, then reenter the OMVS command. If the terminal is not logged off, contact the system programmer.

### **FSUM2078I**

No session was started. The home directory for this TSO/E user ID does not exist or cannot be accessed. Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

# **Explanation**

This TSO/E user ID has a home directory that cannot be used:

- 1. The wrong home directory might be specified in the RACF user profile for this TSO/E user ID.
- 2. The home directory might not exist in the file system.
- 3. The file system containing the home directory might not be mounted.
- 4. This user might not have search permission for the home directory.

In the message text:

#### return-value-hex

The return value from sigprocmask.

#### return-code

The return code, in hexadecimal, from sigprocmask.

#### reason-code

The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

# **System action**

The OMVS command ends and returns to TSO/E, without starting a shell session.

# System programmer response

Make sure the home directory specified in the RACF user profile for this TSO/E user ID is correct. Check that the home directory exists and that the file system containing it is mounted. Make sure that the permissions for the home directory allow the TSO/E user ID to search the directory. For information about setting up user IDs for z/OS UNIX, see Defining z/OS UNIX users to RACF in z/OS UNIX System Services Planning.

To see other suggested actions for the displayed reason code and return code, refer to <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference.

# **User response**

Make sure the home directory for this TSO/E user ID exists in the file system before you enter the OMVS command. If you do not have authority to create the home directory or mount the file system containing it, contact the operator or the system programmer. If the specified home directory is wrong, ask the system programmer to change it.

FSUM2079I Function = sigprocmask,

return value = return-value-hex, return code = return-code, reason code = reason-code

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2078I when you press "?". For more information, see FSUM2078I.

# **System action**

See message FSUM2078I.

# System programmer response

See message FSUM2078I.

### **User response**

See message FSUM2078I.

#### **FSUM2080I**

The OMVS command could not request an immediate response from the terminal, because it was logged off and could not be reached.

# **Explanation**

The OMVS command could not send output requiring an immediate response from the terminal, because it was logged off.

# **System action**

The OMVS command ends and returns to TSO/E. Because the terminal is logged off, this error message will probably not show up on the screen.

# **System programmer response**

For more information, see return code 20 from the TPG macro in z/OS TSO/E Programming Services.

### **User response**

If the terminal is logged off, log on to TSO/E, then reenter the OMVS command. If the terminal is not logged off, contact the system programmer.

286 z/OS: z/OS UNIX System Services Messages and Codes

# The OMVS command ended because OpenMVS is no longer available.

# **Explanation**

The z/OS UNIX component ended or was stopped while you were using the OMVS command.

In the message text:

#### error-code

The error code shows which function reported that z/OS UNIX was not active:

```
fork()

#### **FSUM** messages

#### return-value

The return value from the function. If this value is zero, there is no return value available for this error.

#### errno-decimal

The errno value, in decimal, returned from the function. If this value is zero, there is no errno available for this error.

#### errno-hex

The errno value, in hexadecimal, returned from the function.

#### reason-code

The reason code returned from the function. If this value is zero, there is no reason code for this error.

#### system-message

The system message corresponding to the errno value. If errno is zero, this message is not meaningful.

# System action

The OMVS command ends and returns to TSO/E. The OMVS command may also abend with EC6 abend code after this message is displayed.

### System programmer response

If z/OS UNIX was not stopped or did not end, respond as indicated for the displayed reason code. For a description of the displayed errno and reason code values, see z/OS C/C++ Runtime Library Reference.

### User response

Wait for z/OS UNIX to be restarted before reentering the OMVS command.

FSUM2082I	Error code = error-code,
	return value = <i>return-value</i> ,
	errno = errno-decimal (X'errno-hex'),
	reason code = <i>reαson-code</i> ,

reason code = reason-code, description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2081I when you press "?". For more information, see FSUM2081I.

### System action

See message FSUM2081I.

#### System programmer response

See message FSUM2081I.

### User response

See message FSUM2081I.

FSUM2083I	No session was started. OpenMVS is not active.Function = sigprocmask,
	return value = <i>return-value-hex</i> ,
	return code = <i>return-code</i> ,
	reason code = regson-code

# **Explanation**

z/OS UNIX was not active when you entered the OMVS command.

In the message text:

#### return-value-hex

The return value from sigprocmask.

#### return-code

The return code, in hexadecimal, from sigprocmask.

#### reason-code

The reason code returned from sigprocmask; if this value is zero, there is no reason code for this error.

# System action

The OMVS command ends and returns to TSO/E, without starting a shell session.

# System programmer response

If z/OS UNIX is already active, follow the actions suggested in z/OS UNIX System Services Programming: Assembler Callable Services Reference for the displayed reason code.

# **User response**

Contact the system operator, to start z/OS UNIX, if required. Wait for z/OS UNIX to start and become fully active before reentering the OMVS command. If z/OS UNIX is already active, contact the system programmer with the reason shown in the second-level TSO/E message.

#### FSUM2084I

Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2083I when you press "?". For more information, see FSUM2083I.

# System action

See message FSUM2083I.

#### System programmer response

See message FSUM2083I.

#### **User response**

See message FSUM2083I.

#### FSUM2085I

No session was started. OpenMVS was stopped and has been restarted. Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

### **Explanation**

A z/OS UNIX application other than the OMVS command is running in this address space. z/OS UNIX stopped and was restarted while that other application was still running. The OMVS command was entered after z/OS UNIX was restarted and before the other application ended.

All z/OS UNIX applications in an address space must end after z/OS UNIX is restarted, before you can enter the OMVS command again.

#### **FSUM** messages

In the message text:

#### return-value-hex

The return value from sigprocmask.

#### return-code

The return code, in hexadecimal, from sigprocmask.

#### reason-code

The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error

# **System action**

The OMVS command ends and returns to TSO/E, without starting a shell session.

# System programmer response

If logging off and back on to TSO/E did not solve the problem, follow the actions suggested in <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference for the displayed reason code.

# **User response**

Make sure all z/OS UNIX applications have ended. If ISPF is active, end it and get back to the TSO/E READY prompt. End any active REXX exec or CLIST. Then reenter the OMVS command.

If the error recurs, try logging off TSO/E. Log back on and reenter OMVS. If the error still recurs, contact the system programmer with the reason shown in the second-level TSO/E message.

**FSUM2086I** 

Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2085I when you press "?". For more information, see FSUM2085I.

# **System action**

See message FSUM2085I.

# System programmer response

See message FSUM2085I.

### **User response**

See message FSUM2085I.

#### **FSUM2087I**

The SESSIONS(specified-sessions) operand on the OMVS command specified too many sessions. Maximum number of sessions = max-sessions

### **Explanation**

The OMVS command could not start all the sessions asked for by the SESSIONS(n) operand. The maximum number of sessions that OMVS can start is determined by the MAXPROCUSER or CHILD\_MAX value for the system. OMVS cannot start more than MAXPROCUSER/2 shell sessions.

In the message text:

### specified-sessions

The number of sessions specified by the OMVS command SESSIONS() operand.

#### max-sessions

The maximum number of shell sessions that can be started.

# **System action**

The OMVS command tries to start the maximum number of sessions allowed. Processing continues with this reduced number of sessions.

# System programmer response

If required, increase the value of MAXPROCUSER to at least twice the number of sessions needed by each user ID.

### User response

The maximum number of sessions allowed is shown in the message text. Specify no more than this number in the OMVS command SESSIONS() operand.

If more sessions are required, ask the system programmer to increase the value of MAXPROCUSER to at least twice the number of sessions required.

#### **FSUM2088I**

The OMVS command ended unexpectedly. The recovery routine was invoked. OMVS control block address = *omvs-block*, C control block address = *c-block* 

# **Explanation**

The OMVS command has abended. There is probably another message that contains an abend code.

In the message text:

#### omvs-block

The address of the main TSO/E OMVS command control block.

#### c-block

The address of the main runtime library control block.

# **System action**

The OMVS command ends, and control is returned to TSO/E. This message should be accompanied by message FSUM2089I.

### System programmer response

See the recommended response for the abend code in z/OS MVS System Codes.

### User response

If this abend is unexpected, contact the system programmer.

### **FSUM2089I**

First OMVS module address = module1-address, second OMVS module address = module2-address, PSW = psw0-3 psw4-7

# **Explanation**

This message is displayed after message FSUM2088I. This message contains additional information that may assist in problem determination. See message FSUM2088I for a description of the error.

In the message text:

### **FSUM** messages

#### module1-address

The address of the main load module for the TSO/E OMVS command.

#### module2-address

The address of another load module for the TSO/E OMVS command.

#### psw0-3

The first 4 bytes of the error program status word (PSW).

### psw4-7

The second 4 bytes of the error PSW.

# **System action**

The OMVS command ends, and control is returned to TSO/E. This message should be accompanied by message FSUM2088I.

# System programmer response

See message FSUM2088I.

### **User response**

If this abend is unexpected, contact the system programmer.

#### FSUM2091I

The OMVS command ended because incorrect data was received from the terminal. This is a terminal or system error. No data bytes were received from the terminal. Function = TGET, return code = return-code The first character (X'aid-byte') was unexpected. Function = TGET, return code = return-code, data count = data-count The location of the cursor was partly missing. Function = TGET, return code = return-code, data count = data-count, data = incomplete-cursor **Unexpected control information** was received from the terminal. Function = TGET. return code = return-code, data count = data-count, data = unexpected-order Data describing the screen location of the input field was incomplete. Function = TGET. return code = return-code, data count = data-count, data = incomplete-address The input data came in from an unexpected screen location. Function = TGET, return code = return-code, data count = data-count, data = unexpected-address Input data came in from more than one location on the screen. Function = TGET, return code = return-code,

data count = data-count, data from second field = second-field Input data was received when none was expected. Function = TGET, return code = return-code, data count = data-count, data = unexpected-input The final character of input data was missing. Function = TGET, return code = return-code, data count = data-count, data = incomplete-input An unexpected character was found in the input data. **Function = TGET.** return code = return-code, data count = data-count, data = unexpected-bytes Too much input data was received. **Function = TGET.** return code = return-code, data count = data-count, data = *starting-data* An incorrect DBCS mixed string was received. Function = TGET, return code = return-code, data count = data-count, data = mixed-data

# **Explanation**

The OMVS command received incorrect data from the 3270 terminal. This error is probably caused by a terminal or system problem, and not by what the user entered. The second-level message describes the specific data stream error seen by the OMVS command:

#### FSUM2092I

The OMVS command issued TGET and received no data from the terminal. In full-screen mode, the terminal should always send in at least 1 byte of data (the AID byte).

#### FSUM2093I

The first byte of data from the terminal was not one of the expected 3270 AID bytes.

#### **FSUM2094I**

Only 2 bytes of data were received from the terminal in full-screen mode. This indicates that the second byte of the cursor address was missing in the data stream.

#### FSUM20951

An unexpected display order was received from the terminal. The first display order in the data stream should be the 3270 SET BUFFER ADDRESS (SBA) order.

#### FSUM20961

Exactly 5 bytes of input data were received from the terminal. The second byte of the screen address of the first input field is missing.

#### FSUM2097I

Input data was received from some location other than the usual OMVS command input area at the bottom of the screen. This error can be caused by repeatedly entering data while the normal OMVS command screen is not being displayed.

#### **FSUM2098I**

Input data was received from two or more input fields on the same screen. This error can be caused by repeatedly entering data while the normal OMVS command screen is not being displayed.

#### FSUM2099I

Input data was received while the OMVS command did not have an input area on the screen. This error can be caused by repeatedly entering data while the normal OMVS screen is not being displayed.

#### **FSUM2100I**

The data stream received from the terminal ended with a graphic escape (GE) character, but there was no character following the GE.

#### **FSUM2101I**

The data stream received from the terminal contained one or more of the following unexpected characters:

```
SET ATTRIBUTE (SA)
START FIELD (SF)
START FIELD EXTENDED (SFE)
SHIFT OUT (SO)
SHIFT IN (SI)
NULL
```

#### **FSUM2102I**

Too much data was received from the terminal. The data was too long to fit in the normal input area at the bottom of the screen. This error can be caused by repeatedly entering data while the normal OMVS command screen is not being displayed.

#### **FSUM2103I**

An odd-length DBCS subfield in a mixed DBCS string was received from the terminal. In addition, the final (odd) byte was out of range for DBCS data. The terminal should never send in odd-length DBCS subfields or incorrect characters in DBCS subfields.

In the message text:

#### return-code

The return code from TSO/E.

#### aid-byte

The first byte of data, in hexadecimal, from the terminal. This is the unexpected 3270 AID byte.

#### data-count

The number of bytes of data received from the terminal.

#### incomplete-cursor

The 2 bytes of data, in hexadecimal, received from the terminal. The last byte is the incomplete cursor address.

#### unexpected-order

The first few bytes of data, in hexadecimal, received from the terminal. These bytes contain the unexpected 3270 display order that was received.

#### incomplete-address

The first 5 bytes of data, in hexadecimal, received from the terminal. The last byte of data is the incomplete screen address of the first input field.

#### unexpected-address

The first few bytes of data, in hexadecimal, received from the terminal. These bytes contain the unexpected screen address of the input data.

#### second-field

The first few bytes of data, in hexadecimal, received from the second input field on the screen.

#### unexpected-input

The first few bytes of data, in hexadecimal, received from the terminal. These bytes contain the unexpected input data.

#### incomplete-input

The last few bytes of data, in hexadecimal, received from the terminal. The last byte of data is the start of an incomplete graphic escape character.

### unexpected-bytes

A few bytes of data, in hexadecimal, received from the terminal, The first byte of data is the unexpected character.

### starting-data

The first few bytes of data, in hexadecimal, received from the terminal,

#### mixed-data

The last few bytes of an odd-length DBCS subfield received from the terminal. The last byte is the usually the Shift In (SI) or Shift Out (SO) character that ends the incorrect subfield.

# **System action**

The OMVS command ends and returns to TSO/E, ending the shell session.

# System programmer response

Examine the bytes of data from the terminal in the second-level message. If there is a terminal data stream error, determine the cause of this error.

If there is too much data or data from unexpected input fields, there may be no terminal or system problem. It is possible that the user repeatedly entered data while the normal OMVS command screen was not being displayed. In these cases, use the DEBUG(DATA) keyword on the TSO/E OMVS command to trace the data from the terminal.

# **User response**

Report this problem to the system programmer.

#### FSUM2092I

No data bytes were received from the terminal. Function = TGET, return code = return-code

### **Explanation**

This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

# System action

See message FSUM2091I.

### System programmer response

See message FSUM2091I.

# User response

See message FSUM2091I.

#### **FSUM2093I**

The first character (X'aid-byte') was unexpected. Function = TGET, return code = return-code, data count = data-count

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

# **System action**

See message FSUM2091I.

# System programmer response

See message FSUM2091I.

### **User response**

See message FSUM2091I.

# FSUM2094I The location of the cursor was partly missing. Function = TGET, return code = return-code,

data count = data-count, data = incomplete-cursor

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

# **System action**

See message FSUM2091I.

# System programmer response

See message FSUM2091I.

# **User response**

See message FSUM2091I.

### FSUM2095I Unexpected control information was received from the terminal.

Function = TGET,

return code = return-code, data count = data-count, data = unexpected-order

### **Explanation**

This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

# **System action**

See message FSUM2091I.

### **System programmer response**

See message FSUM2091I.

### **User response**

See message FSUM2091I.

FSUM2096I Data describing the screen location of the input field was incomplete.

Function = TGET,

return code = return-code,

### data count = datα-count, data = incomplete-address

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

# **System action**

See message FSUM2091I.

# **System programmer response**

See message FSUM2091I.

# **User response**

See message FSUM2091I.

#### **FSUM2097I**

The input data came in from an unexpected screen location. Function = TGET,

return code = return-code, data count = data-count, data = unexpected-address

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

# **System action**

See message FSUM2091I.

# System programmer response

See message FSUM2091I.

### **User response**

See message FSUM2091I.

#### **FSUM2098I**

Input data came in from more than one location on the screen. Function

= TGET,

return code = return-code, data count = data-count,

data from second field = second-field

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

# **System action**

See message FSUM2091I.

# System programmer response

See message FSUM2091I.

### **User response**

See message FSUM2091I.

#### FSUM2099I

Input data was received when none was expected. Function = TGET, return code = return-code, data count = data-count, data = unexpected-input

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

# **System action**

See message FSUM2091I.

# System programmer response

See message FSUM2091I.

# **User response**

See message FSUM2091I.

### FSUM2100I

The final character of input data was missing. Function = TGET, return code = return-code, data count = data-count, data = incomplete-input

### **Explanation**

This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

data = unexpected-bytes

### **System action**

See message FSUM2091I.

### **System programmer response**

See message FSUM2091I.

### **User response**

See message FSUM2091I.

#### **FSUM2101I**

An unexpected character was found in the input data. Function = TGET, return code = return-code, data count = data-count,

This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

# System action

See message FSUM2091I.

# System programmer response

See message FSUM2091I.

# **User response**

See message FSUM2091I.

### FSUM2102I Too much input data was received. Function = TGET,

return code = return-code, data count = data-count, data = starting-data

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

# **System action**

See message FSUM2091I.

### **System programmer response**

See message FSUM2091I.

### User response

See message FSUM2091I.

# FSUM2103I An incorrect DBCS mixed string

was received. Function = TGET, return code = return-code, data count = data-count, data = mixed-data

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2091I when you press "?". For more information, see FSUM2091I.

# **System action**

See message FSUM2091I.

### System programmer response

See message FSUM2091I.

## **User response**

See message FSUM2091I.

**FSUM2107I** 

The OMVS command ended because OpenMVS was restarted.+
Error code = error-code, return value = return-value, errno = errno-decimal(X'errno-hex'), reason code = reason-code, description = "system-message"

# **Explanation**

The z/OS UNIX component ended or was stopped while you were using the OMVS command. z/OS UNIX was then restarted.

In the message text:

#### error-code

The error code shows which function reported that z/OS UNIX was restarted:

```
68
   fork()
70
   chdir()
71
   getlogin()
72

    ptsname()
139
    ttyname()
```

#### return-value

The return value from the function. If this value is zero, there is no return value available for this error.

#### errno-decimal

The errno value, in decimal, returned from the function. If this value is zero, there is no errno available for this error.

#### errno-hex

The errno value, in hexadecimal, returned from the function.

#### reason-code

The reason code returned from the function. If this value is zero, there is no reason code for this error.

### system-message

The system message corresponding to the errno value. If errno is zero, this message is not meaningful.

# **System action**

The OMVS command ends and returns to TSO/E. The OMVS command may also abend with EC6 abend code after this message is displayed.

### System programmer response

If logging off and back on to TSO/E did not solve the problem, respond as indicated for the displayed reason code. For a description of the displayed errno and reason code values, see <u>z/OS C/C++ Runtime Library</u> Reference.

### User response

Make sure all z/OS UNIX applications have ended. If ISPF is active, end it and return to the TSO/E READY prompt. End any active REXX exec or CLIST. Then reenter the OMVS command.

If the error recurs, try logging off TSO/E. Log back on and reenter OMVS. If the error still recurs, contact the system programmer with the reason shown in the second-level TSO/E message.

### **FSUM2108I**

Error code = error-code, return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2107I when you press "?". For more information, see FSUM2107I.

### **System action**

See message FSUM2107I.

### System programmer response

See message FSUM2107I.

## **User response**

See message FSUM2107I.

#### FSUM2109I

The OMVS command ended because too many consecutive rewrites of the same screen were required.

# **Explanation**

The OMVS command received many consecutive reshow indications from TSO/E. Each reshow indication causes the OMVS command to completely rewrite the entire screen. If too many consecutive reshow indications occur, the OMVS command may be in a screen refresh loop. This error can be caused by:

- Pressing the <PA2> key many times consecutively without pressing any other keys in between.
- Receiving many files or TSO/E messages from other users continuously for a long period of time while the OMVS command is running.
- Running the OMVS command with the DEBUG option directed to the terminal. This happens if you have
  allocated the debug file to the terminal using a command such as ALLOCATE FILE(SYSFSUMO) DATASET(\*).

# **System action**

The OMVS command ends and returns to TSO/E.

# System programmer response

If there is no apparent explanation for this error, report the problem to the IBM support center.

# **User response**

Do not press the <PA2> key consecutively too many times without entering any data or pressing any function keys. Do not allocate the debug file to the terminal. If this error was not caused by one of these two actions, contact the system programmer.

#### **FSUM2110I**

User abend code = user-abend-code, reason code = reason-code

### **Explanation**

This is a TSO/E secondary message that appears following FSUM2113I when you press "?". For more information, see FSUM2113I.

### **System action**

See message FSUM2113I.

# System programmer response

See message FSUM2113I.

### **User response**

See message FSUM2113I.

**FSUM2111I** 

The TSO/E-command-name command ended with return code = return-code-decimal (X'return-code-hex').

# **Explanation**

The TSO/E command ended with the nonzero return code displayed in the message. This TSO/E message is issued only if the OMVS command was invoked with the **DEBUG** option.

In the message text:

### TSO/E-command-name

The name of the TSO/E command that was being run.

#### return-code-decimal

The return code, in decimal, from the TSO/E command.

#### return-code-hex

The return code, in hexadecimal, from the TSO/E command.

# System action

The OMVS command continues processing as usual. The invoked TSO/E command may have failed.

# System programmer response

Perform the responses in the messages for the TSO/E command. This error was detected by the TSO service routine (IKJEFTSR), which ended with return code 4. For more information about IKJEFTSR return codes, see z/OS TSO/E Programming Services.

# **User response**

Consult the appropriate return code documentation for the TSO/E command. The failing TSO/E command may have issued error messages. Perform the responses for these messages. To suppress this message, enter the OMVS command without specifying the **DEBUG** option.

#### **FSUM2112I**

The TSO/E-command-name command ended because of an attention interruption.

# **Explanation**

The <Attention> key was pressed while the TSO/E command was running. This attention interruption caused the TSO/E command to end and return to the OMVS command.

In the message text:

#### TSO/E-command-name

The name of the TSO/E command that was being run.

# System action

The TSO/E command ends and returns to the OMVS command. The OMVS command continues processing normally. The TSO/E command may have issued other error messages.

#### System programmer response

This error was detected by the TSO service routine (IKJEFTSR), which ended with return code 8. For more information about IKJEFTSR return codes, see *z/OS TSO/E Programming Services*.

### **User response**

If this error was not caused by pressing the <Attention> key, contact the system programmer. If the TSO/E command issued any error messages, perform the responses for these messages.

#### **FSUM2113I**

The TSO/E-command-name command ended abnormally.

# **Explanation**

A TSO/E command ended abnormally, with a user or system abend. The abend codes and reason codes are displayed in the second-level TSO/E message. See z/OS MVS System Codes for the system abend code and

### **FSUM** messages

reason code. If a user abend code is displayed, see appropriate documentation for user abend codes from this TSO/E command.

In the message text:

### TSO/E-command-name

The name of the TSO/E command that was being run when the abend occurred.

#### user-abend-code

The user abend code from the TSO/E command.

#### reason-code

The reason code for the abend.

#### system-abend-code

The system abend code from the TSO/E command.

# **System action**

The TSO/E command ends, and control returns to the OMVS command. The OMVS command continues processing normally.

Normally, the system does not request a dump for this error. However, if the **DEBUG** option was specified on the TSO/E OMVS command, the system requests a dump.

# System programmer response

This error was detected by the TSO service routine (IKJEFTSR), which ended with return code 12. For more information about IKJEFTSR return codes, see *z/OS TSO/E Programming Services*.

# **User response**

Perform the responses for the user and system abend codes and the reason code. Other error messages may have appeared. If so, perform the responses for those messages.

### **FSUM2114I**

System abend code = system-abend-code, user abend code = user-abend-code, reason code = reason-code

### **Explanation**

This is a TSO/E secondary message that appears following FSUM2113I when you press "?". For more information, see FSUM2113I.

### **System action**

See message FSUM2113I.

# System programmer response

See message FSUM2113I.

### **User response**

See message FSUM2113I.

#### **FSUM2115I**

System abend code = system-abend-code, reason code = reason-code

### **Explanation**

This is a TSO/E secondary message that appears following FSUM2113I when you press "?". For more information, see FSUM2113I.

# **System action**

See message FSUM2113I.

# System programmer response

See message FSUM2113I.

### **User response**

See message FSUM2113I.

#### FSUM2116I

The TSO/E-command-name command was not found.

# **Explanation**

The requested TSO/E command was not found, so it could not be run.

In the message text:

### TSO/E-command-name

The name of the TSO/E command that was requested.

# System action

The OMVS command continues processing normally. The requested command is not run.

# System programmer response

Make sure that the user has access to the requested TSO/E command.

This error was detected by the TSO service routine (IKJEFTSR), which ended with return code 20 and reason code 40. For more information about IKJEFTSR return codes and reason codes, see *z/OS TSO/E Programming Services*.

# **User response**

Correct the name of the TSO/E command and try again. If the TSO/E command name was typed correctly, contact the system programmer.

### FSUM2117I

TSO/E-command-name is an unsupported background function.

#### **Explanation**

The system cannot run the requested TSO/E command because it is running in the background.

In the message text:

# TSO/E-command-name

The name of the TSO/E command that was requested.

### **System action**

The OMVS command continues processing normally. The requested command is not run.

### System programmer response

This error was detected by the TSO service routine (IKJEFTSR), which ended with return code 20 and reason code 52. For more information about IKJEFTSR return codes and reason codes, see *z/OS TSO/E Programming Services*.

# **User response**

Contact the system programmer with this message number and the name of the requested TSO/E command.

#### **FSUM2118I**

TSO/E-command-name is an authorized function, but a copy of the function could not be found in an authorized library.

# **Explanation**

The system cannot run the requested TSO/E command. The TSO/E command is authorized but could not be found in an authorized library.

In the message text:

### TSO/E-command-name

The name of the TSO/E command that was to be run.

# **System action**

The OMVS command continues processing normally. The requested authorized command is not run.

# System programmer response

This error was detected by the TSO service routine (IKJEFTSR), which ended with return code 20 and reason code 56. For more information about IKJEFTSR return codes and reason codes, see <u>z/OS TSO/E Programming</u> Services.

If the requested TSO/E command should be authorized, make sure it is available to this TSO/E user in an authorized library. If the requested command is not supposed to be authorized, make sure that it is not marked as authorized.

# User response

Contact the system programmer with this message number and the name of the requested TSO/E command.

#### **FSUM2119I**

The command name contains a syntax error.

### **Explanation**

The entered command name is not valid. It contains a syntax error.

### **System action**

The OMVS command continues processing normally. The requested command was not run.

### System programmer response

This error was detected by the TSO service routine (IKJEFTSR), which ended with return code 20 and reason code 44. For more information about IKJEFTSR return codes and reason codes, see <u>z/OS TSO/E Programming</u> Services.

### User response

Correct the name of the TSO/E command and try it again. If the command name is correct, contact the system programmer.

FSUM2120I Function = unlockpt(),

file descriptor = unlock-file-descriptor, terminal name = "TTY-name", return value = unlock-return-value, errno = unlock-errno-decimal (X'unlock-errno-hex'), reason code = unlock-reason-code, description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2170I when you press "?". For more information, see FSUM2170I.

# **System action**

See message FSUM2170I.

# **System programmer response**

See message FSUM2170I.

## **User response**

See message FSUM2170I.

#### **FSUM2121I**

TSO/E encountered an unexpected failure while trying to run the command.Function = IKJEFTSR, return code = return-code, reason code = reason-code

## **Explanation**

TSO/E reported an unexpected error when running the requested TSO/E command. This error was not detected by the OMVS command.

In the message text:

#### return-code

The return code from the TSO/E IKJEFTSR service.

#### reason-code

The reason code from the TSO/E IKJEFTSR service.

# **System action**

The system displays the error message and waits for the user to request the second-level TSO/E error message or enter the next TSO/E command.

## **System programmer response**

This error was detected by the TSO service routine (IKJEFTSR), which ended with the return code and reason code shown in the second-level TSO/E message. For an explanation of the return code and reason code reported by IKJEFTSR, see *z/OS TSO/E Programming Services*. Take the appropriate action for this return code and reason code from IKJEFTSR.

## **User response**

Note the message ID and the return code and reason code from the second-level message. Contact the system programmer with this information.

FSUM2122I

Function = IKJEFTSR, return code = return-code, reason code = reason-code

This is a TSO/E secondary message that appears following FSUM2121I when you press "?". For more information, see FSUM2121I.

# **System action**

See message FSUM2121I.

# System programmer response

See message FSUM2121I.

# **User response**

See message FSUM2121I.

#### **FSUM2123I**

An unknown error was reported while the system was running the command.+ Function = IKJEFTSR, unknown return code = unknown-return-code
Function = IKJEFTSR, return code = return-code, unknown reason code = unknown-reason-code

# **Explanation**

The system tried to run the requested TSO/E command. The system reported a return code or reason code that was unknown to the OMVS command.

In the message text:

#### unknown-return-code

The return code from the TSO/E IKJEFTSR service. The OMVS command did not recognize this return code.

#### return-code

The return code from the TSO/E IKJEFTSR service.

#### unknown-reason-code

The reason code from the TSO/E IKJEFTSR service. The OMVS command did not recognize this reason code.

## **System action**

The system displays the error message and waits for the user to request the second-level TSO/E error message or enter the next TSO/E command.

## System programmer response

This error was detected by the TSO service routine (IKJEFTSR), which ended with the return code and reason code shown in the second-level TSO/E message. The OMVS command did not recognize this return code or reason code. For an explanation of the return code and reason code reported by IKJEFTSR, see <u>z/OS TSO/E</u> Programming Services. Take the appropriate action for this return code and reason code from IKJEFTSR.

## **User response**

Note the message ID and the return code and reason code from the second-level message. Contact the system programmer with this information.

**FSUM2124I** 

Function = IKJEFTSR, unknown return code = unknown-return-code

## FSUM2126I

An unexpected error was reported while the system was running the command. Function = IKJEFTSR, return code = return-code
Function = IKJEFTSR, return code = return-code, reason code = reason-code

# **Explanation**

The system tried to run the requested TSO/E command. The system reported an unexpected error to the OMVS command.

In the message text:

#### return-code

The return code from the TSO/E IKJEFTSR service.

#### reason-code

The reason code from the TSO/E IKJEFTSR service.

# **System action**

The OMVS command ends and returns to TSO/E.

# System programmer response

This error was detected by the TSO service routine (IKJEFTSR), which ended with the return code and reason code shown in the second-level TSO/E message. The OMVS command did not expect this return code or reason code. For an explanation of the return code and reason code reported by IKJEFTSR, see <u>z/OS TSO/E</u> Programming Services. Take the appropriate action for this return code and reason code from IKJEFTSR.

# **User response**

Note the message ID and the return code and reason code from the second-level message. Contact the system programmer with this information.

#### FSUM2127I

Function = IKJEFTSR, return code = return-code

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2126I when you press "?". For more information, see FSUM2126I.

# **System action**

See message FSUM2126I.

# System programmer response

See message FSUM2126I.

## **User response**

See message FSUM2126I.

#### **FSUM2128I**

Function = IKJEFTSR, return code = return-code, reason code = reason-code

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2126I when you press "?". For more information, see FSUM2126I.

## **System action**

See message FSUM2126I.

## **System programmer response**

See message FSUM2126I.

#### User response

See message FSUM2126I.

#### **FSUM2129I**

No session was started. The program to start the shell could not be invoked. Function = attach\_exec, program name = 'program-name', return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

The OMVS command could not invoke the login program that starts the z/OS UNIX shell. The attach\_exec function failed with the errno and reason code displayed in the second-level TSO/E message.

In the message text:

## program-name

The name of the login program passed to attach\_exec.

#### return-value

The return value from attach\_exec.

#### errno-decimal

The errno value, in decimal, returned from attach\_exec.

#### errno-hex

The errno value, in hexadecimal, returned from attach\_exec.

#### reason-code

The reason code returned from attach exec.

#### system-message

The system message corresponding to the returned errno value.

# **System action**

The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

## System programmer response

For an explanation of the errno and reason code from attach\_exec, see <u>z/OS UNIX System Services</u>

<u>Programming: Assembler Callable Services Reference</u>. Follow any suggested actions for this errno value and reason code.

Check that the program named in the message (the login program) exists in the file system. Make sure the program file has the proper execute permissions so this user can run it and that the permissions for the directory containing the program are set properly so this user is allowed access. Make sure that the SETUID and SETGID flags are not set for this program.

#### **User response**

Try the OMVS command or OPEN subcommand again. If this problem persists, contact the system programmer with all information displayed in the second-level TSO/E message.

**FSUM2130I** 

Function = attach\_exec, program name = 'program-name', return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2129I when you press "?". For more information see FSUM2129I.

## **System action**

See message FSUM2129I.

# System programmer response

See message FSUM2129I.

## **User response**

See message FSUM2129I.

#### FSUM2131I

The OMVS command was unable to obtain the next input line.+Function = PUTGET, return code = return-code

# **Explanation**

The OMVS command was unable to obtain the next TSO/E command from the terminal. The system reported an unexpected error. For more information about the displayed return code from PUTGET, see <u>z/OS TSO/E</u> Programming Services.

In the message text:

#### return-code

The return code from the TSO/E PUTGET service.

# **System action**

The OMVS command automatically returns from TSO/E mode back to subcommand mode or to the shell.

# System programmer response

For more information about return codes from PUTGET, see <u>z/OS TSO/E Programming Services</u>. It is possible that the OMVS command was invoked from another application or CLIST. This application or CLIST may have set up the TSO/E input stack in such a way that the OMVS command could not obtain any lines after the user switched to TSO/E.

#### **User response**

Contact the system programmer with the message number and the return code displayed in the second-level TSO/E message.

## **FSUM2132I**

Function = PUTGET, return code = return-code

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2131I when you press "?". For more information, see FSUM2131I.

## **System action**

See message FSUM2131I.

## System programmer response

See message FSUM2131I.

#### User response

See message FSUM2131I.

FSUM2133I No session was started. No more processes can be started for this

UID.Function = sigprocmask, return value = return-value-hex, return code = return-code,

#### reason code = reason-code

# **Explanation**

This UID was already running the maximum allowed number of processes when the OMVS command was entered. The new process required for the OMVS command could not start.

Active z/OS UNIX batch jobs submitted for this TSO/E user ID count as processes for this UID. Other TSO/E user IDs may share the same UID with this TSO/E user ID. If those user IDs are currently using z/OS UNIX, their processes also count toward the maximum allowed for this UID.

In the message text:

#### return-value-hex

The return value from sigprocmask.

#### return-code

The return code, in hexadecimal, from sigprocmask.

#### reason-code

The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

# **System action**

The OMVS command ends and returns to TSO/E, without starting a shell session.

# System programmer response

If required, increase the maximum number of processes allowed for a UID. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see <u>z/OS UNIX System Services</u> Planning.

To see other suggested actions for the displayed reason code and return code, refer to z/OS UNIX System Services Programming: Assembler Callable Services Reference.

## **User response**

Wait for any z/OS UNIX batch jobs from this TSO/E user ID to end before reentering the OMVS command. Other TSO/E user IDs may share a common UID with this user ID. Reenter the OMVS command after one of those TSO/E user IDs has finished using z/OS UNIX.

Ask the system programmer to increase the maximum number of processes allowed per UID.

FSUM2134I Function = sigprocmask,

return value = return-value-hex, return code = return-code, reason code = reason-code

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2133I when you press "?". For more information, see FSUM2133I.

## **System action**

See message FSUM2133I.

## System programmer response

See message FSUM2133I.

## **User response**

See message FSUM2133I.

FSUM2135I	No session was started. No more UIDs can log in to the shell. Function =
	sigprocmask,
	return value = return-value-hex,
	return code = <i>return-code</i> ,
	reason code = reαson-code

# **Explanation**

The TSO/E OMVS command was entered when no more UIDs were allowed to use z/OS UNIX. The OMVS command cannot start until some other UID stops using z/OS UNIX.

In the message text:

#### return-value-hex

The return value from sigprocmask.

#### return-code

The return code, in hexadecimal, from sigprocmask.

#### reason-code

The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

# System action

The OMVS command ends and returns to TSO/E, without starting a shell session.

# System programmer response

If required, increase the maximum number of UIDs that can use z/OS UNIX. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see <u>z/OS UNIX System Services</u> Planning.

To see other suggested actions for the displayed reason code and return code, refer to <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference.

## **User response**

Wait for another UID to stop using z/OS UNIX, before reentering the OMVS command.

Ask the system programmer to increase the maximum number UIDs that can use z/OS UNIX.

FSUM2136I	Function = sigprocmask,	
	return value = <i>return-vαlue-hex</i> ,	
	return code = return-code,	
	reason code = <i>reason-code</i>	

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2135I when you press "?". For more information, see FSUM2135I.

## **System action**

See message FSUM2135I.

# System programmer response

See message FSUM2135I.

## User response

See message FSUM2135I.

#### FSUM2137I

No session was started. Too many processes are already active in the system.Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

# **Explanation**

The OMVS command was entered when the maximum number of processes was already running. The new process required for the OMVS command could not start.

In the message text:

#### return-value-hex

The return value from sigprocmask.

#### return-code

The return code, in hexadecimal, from sigprocmask.

#### reason-code

The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

# **System action**

The OMVS command ends and returns to TSO/E without starting a shell session.

# System programmer response

If required, increase the maximum number of processes allowed for z/OS UNIX. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see <u>z/OS UNIX System Services</u> Planning.

To see other suggested actions for the displayed reason code and return code, refer to <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference.

## **User response**

Retry the OMVS command later, when the system is not as busy.

Ask the system programmer to increase the maximum number processes that can be active at one time.

**FSUM2138I** 

Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2137I when you press "?". For more information, see FSUM2137I.

# **System action**

See message FSUM2137I.

# System programmer response

See message FSUM2137I.

## **User response**

See message FSUM2137I.

#### FSUM2139I

No session was started. Too many files and pseudo-TTYs are already in use. Function = open(), terminal name ='TTY-name', return value = return-value, errno = errno-decimal(X'errno-hex'), reason code = reason-code, description = 'system-message'

# **Explanation**

OMVS was unable to open the pseudo-tty required to start a session with the shell. Too many file descriptors were already open for this process. Each open file and pseudo-tty uses one of the available file descriptors.

This error is most likely to occur if you are trying to start too many shell sessions. Each shell session requires at least one open pseudo-tty.

It may also occur if you did not enter the OMVS command directly from the TSO/E READY prompt. In this case, other running applications may have open files.

You may have switched to TSO/E while using the OMVS command. If you enter a second OMVS command, both instances of OMVS will have open files, and the combined number of open files may exceed the limit.

In the message text:

#### TTY-name

The pseudo-tty name that was passed to open() when this error occurred.

#### return-value

The return value from open().

#### errno-decimal

The errno value, in decimal, returned from open ().

#### errno-hex

The errno value, in hexadecimal, returned from open().

#### reason-code

The reason code returned from open().

#### system-message

The system message corresponding to the returned errno value.

# **System action**

The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

## System programmer response

If required, increase the number of open files allowed for a process. For more information about this open () error, see <u>z/OS C/C++ Runtime Library Reference</u>. Follow any recommended actions for this errno and reason code.

# **User response**

Try not to start so many shell sessions. Specify fewer initial sessions on the OMVS command.

If you did not enter the OMVS command from the TSO/E READY prompt, make sure that no other programs that use files are running. This includes **OEDIT, OBROWSE, ISHELL,** and other instances of the OMVS command. End the other programs that use files, and try the OMVS command again. If the error still occurs, try entering the OMVS command directly from the TSO/E READY prompt.

If you entered the OMVS command directly from the TSO/E READY prompt, contact the system programmer.

FSUM2140I Function = open(),

terminal name = 'TTY-name', return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code,

description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2139I when you press "?". For more information, see FSUM2139I.

# **System action**

See message FSUM2139I.

# System programmer response

See message FSUM2139I.

# **User response**

See message FSUM2139I.

## FSUM2141I

An unexpected error caused the OMVS command to end.Error code =

error-code,

return code = return-code-decimal

(X'return-code-hex'),

abend code = abend-code, r

eason code = reason-code,

error data = error-data,

error string = 'error-string'

Error code = *error-code*,

return value = return-value, errno = errno-decimal (X'errno-hex'),

reason code = reason-code,

description = 'system-message'

Error code = error-code

# **Explanation**

The OMVS command invoked an MVS or z/OS UNIX C function. That function failed with an unexpected return code, reason code, abend code, or errno.

If the failing routine is an ANSI C function (error code = 193), see z/OS C/C++ Runtime Library Reference for a description of the displayed errno value.

If the failing routine is a z/OS UNIX C function (error code = 161, 162, 171-179, or 181-185), see <u>z/OS C/C++</u> <u>Runtime Library Reference</u> for a description of the displayed errno (z/OS UNIX return code) and reason code values.

## **FSUM** messages

If the failing routine is a TSO/E service (error code = 12-15, 21, 23-26, 32, 41-44, 53-56, 58, 62, 66, and 67), see *z/OS TSO/E Programming Services* for a description of the displayed return code and reason code values.

If the failing routine is an MVS service (error code = 11 or 29), see <u>z/OS MVS Programming</u>: Assembler Services Reference ABE-HSP for a description of the displayed abend code and reason code values.

If a nonzero abend code is displayed, see z/OS MVS System Codes for a description of the displayed abend code and reason code values.

The system may have issued other error messages that further explain the error.

In the message text:

#### error-code

The error code shows which function failed:

#### return-code-decimal

The return code, in decimal, from a called function.

#### return-code-hex

The return code, in hexadecimal, from a called function.

#### abend-code

An abend code associated with this error. If this value is zero, there is no abend code for this error.

#### reason-code

A reason code associated with this error. If this value is zero, there is no reason code available for this error.

#### error-data

Additional data associated with this error. If this value is zero, there is no additional data for this error.

#### error-string

A string of characters that provides additional error information. If this string is empty, no error string is available for this error.

#### return-value

The return value from the function. If this value is zero, there is no return value available for this error.

#### errno-decimal

The errno value, in decimal, returned from the function. If this value is zero, there is no errno available for this error.

#### errno-hex

The errno value, in hexadecimal, returned from the function.

#### system-message

The system message corresponding to the returned errno value. If errno is zero, this message is not meaningful.

## **System action**

The OMVS command ends immediately, and returns to TSO/E.

## System programmer response

Follow the suggested actions for the abend code, return code, and reason code displayed in the message.

## **User response**

Contact the system programmer with this message number and the displayed error information from the second-level TSO/E message.

## **FSUM2142I**

Error code = error-code, return code = return-code-decimal (X'return-code-hex'), abend code = abend-code, reason code = reason-code, error data = error-data,

FSUM2145I

An internal error caused the OMVS

command to end.+

Error code = error-code,
reason code = reason-code,
error data = error-data,
error string = error-string
Error code = error-code,
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'
Error code = error-code

## **Explanation**

The OMVS command detected an error, probably in the OMVS command or the message catalog.

In the message text:

#### error-code

The code for this error.

#### reason-code

An additional reason code associated with this error. If this value is zero, there is no additional reason code for this error.

#### error-data

Additional data associated with this error. If this value is zero, there is no additional data for this error.

#### error-string

A string of characters that provides additional error information. If this string is empty, no error string is available for this error.

#### return-value

The return value from a z/OS UNIX service. If this value is zero, there is no return value available for this error.

#### errno-decimal

The errno value, in decimal, returned from a z/OS UNIX service. If this value is zero, there is no errno available for this error.

#### errno-hex

The errno value, in hexadecimal, returned from a z/OS UNIX service.

#### system-message

The system message corresponding to the returned errno value. If errno is zero, this message is not meaningful.

## **System action**

The OMVS command ends immediately and returns to TSO/E.

## **System programmer response**

Report the problem to the IBM support center.

# **User response**

Contact the system programmer with the message number and the error information displayed in the second-level error message.

#### **FSUM2146I**

#### **FSUM2149I**

No session was started. No pseudo-TTYs are available. Function = stat(),
ending name = 'TTY-name',
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

## **Explanation**

The OMVS command could not obtain a free pseudo-tty which is required to start a session with the shell.

All pseudo-ttys may be in use, or one or more may be unusable because of error conditions or definition errors.

If errors prevented the system from using one or more available pseudo-ttys, other error messages should appear. See those messages for more information.

In the message text:

#### TTY-name

The pseudo-tty name that was passed to stat() when this error occurred.

#### return-value

The return value from stat().

#### errno-decimal

The errno value, in decimal, returned from stat().

#### errno-hex

The errno value, in hexadecimal, returned from stat().

## reason-code

The reason code returned from stat().

#### system-message

The system message corresponding to the returned errno value.

# **System action**

The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

## **System programmer response**

If the pseudo-tty name in the second-level message is one higher than the last pseudo-tty defined, the OMVS command looked at all the defined pseudo-ttys and could not find one that was usable. If other messages appeared with this message, errors prevented the OMVS command from using some of the defined pseudo-ttys. For more information, see the descriptions for those messages.

If all pseudo-ttys are busy, you may need to define more pseudo-ttys. This allows more users to start shell sessions.

If the displayed pseudo-tty name is one that should be defined in the system, an error occurred when the system tried to see if that pseudo-tty was defined. For a description of the errno values and reason codes from stat(), see z/OS C/C++ Runtime Library Reference.

Make sure that this manager pseudo-TTY is defined correctly. The system looks for pseudo-ttys starting at /dev/ptyp0000 and continues looking for pseudo-ttys up through /dev/ptyp9999, in order. As soon as the system fails for one of these pseudo-ttys, it looks no further.

## **User response**

If no other error messages appeared with this one, all existing pseudo-ttys may be in use. You can try the OPEN subcommand or OMVS command again later.

If other error messages appeared, perform the responses for those messages. If this problem is persistent, contact your system programmer with the information from all displayed messages.

FSUM2150I

Function = stat(), ending name = 'TTY-name', return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = system-message

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2149I when you press "?". For more information, see FSUM2149I.

# System action

See message FSUM2149I.

# System programmer response

See message FSUM2149I.

# **User response**

See message FSUM2149I.

FSUM2151I

No session was started. The selected pseudo-TTY could not be opened.
Function = open(),
terminal name = 'TTY-name',
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

# **Explanation**

This error message appears with FSUM2149I to provide additional information. The OMVS command found a free pseudo-tty. When it tried to open the subsidiary side of this pseudo-tty, an error occurred. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see <u>z/OS C/C++ Runtime Library Reference</u>.

In the message text:

## TTY-name

The pseudo-tty name that was passed to open() when this error occurred.

## return-value

The return value from open().

#### errno-decimal

The errno value, in decimal, returned from open ().

#### errno-hex

The errno value, in hexadecimal, returned from open().

#### reason-code

The reason code returned from open().

#### system-message

The system message corresponding to the returned errno value.

# **System action**

The system continues to try other defined pseudo-ttys. However, this message appears only when no other pseudo-tty is usable. The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

# System programmer response

This message contains information about the first error the system found when trying to open a manager pseudo-TTY. The system was able to open the corresponding manager pseudo-pty, but could not open the subsidiary side. For an explanation of this open () error, see *z/OS C/C++ Runtime Library Reference*. Follow any recommended actions for this errno and reason code.

In general, make sure that for each manager pseudo-pty with a name such as /dev/ptypNNNN, there is a corresponding subsidiary pseudo-tty with a name such as /dev/ttypNNNN. Make sure that this subsidiary pseudo-tty is defined with the proper permissions and the proper major and minor number.

Note: The system may have experienced many subsidiary pseudo-tty open() failures. Only the first failure is reported by an error message. Any open() errors for other subsidiary pseudo-ttys might or might not be the same.

# **User response**

Contact the system programmer with all the information from all second-level TSO/E messages that appeared with this one.

FSUM2152I	Function = open(),
	terminal name = 'TTY-name',
	return value = <i>return-value</i> ,
	errno = errno-decimal (X'errno-hex'),
	reason code = reason-code,
	description = 'system-message'

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2151I when you press "?". For more information, see FSUM2151I.

## **System action**

See message FSUM2151I.

#### System programmer response

See message FSUM2151I.

#### User response

See message FSUM2151I.

# FSUM2153I No session was started. The process required for the shell could not be created. Function = fork(), return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

The OMVS command could not create the shell process. The fork() function failed with the errno and reason code displayed in the second-level TSO/E message. For an explanation of the errno and reason code, see <u>z/OS</u> <u>C/C++ Runtime Library Reference</u> and <u>z/OS UNIX System Services Programming: Assembler Callable Services Reference</u>.

The system may be too busy to start new processes at this time.

In the message text:

#### return-value

The return value from fork().

#### errno-decimal

The errno value, in decimal, returned from fork().

#### errno-hex

The errno value, in hexadecimal, returned from fork().

#### reason-code

The reason code returned from fork().

#### system-message

The system message corresponding to the returned errno value.

# System action

The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

# System programmer response

For an explanation of the errno and reason code from fork(), see z/OS C/C++ Runtime Library Reference. Follow any suggested actions for this errno value and reason code.

## **User response**

Try the OMVS command or OPEN subcommand again. If this problem persists, contact the system programmer with all information displayed in the second-level TSO/E message.

#### **FSUM2154I**

Function = fork(),
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2153I when you press "?". For more information, see FSUM2153I.

## **System action**

See message FSUM2153I.

#### System programmer response

See message FSUM2153I.

## User response

See message FSUM2153I.

#### FSUM2155I

No session was started. The OMVS command side of the pseudo-TTY could not be set up properly. Function = close(), file descriptor = close-file-descriptor, terminal name = 'TTY-name', return value = close-return-value, errno = close-errno-decimal (X'close-errno-hex'), reason code = close-reason-code, description = 'system-message' Function = fcntl(), terminal name = 'TTY-name", file descriptor = fcntl-file-descriptor, return value = fcntl-return-value, errno = fcntl-errno-decimal (X'fcntl-errno-hex'), reason code = fcntl-reason-code, description = 'system-message'

# **Explanation**

The system obtained a pseudo-tty to use for the session with the shell. While this pseudo-tty was being prepared, one of two errors occurred:

#### **FSUM2156I**

The OMVS command ran fork() or attach\_exec to create the process for the z/OS shell. The main OMVS command process was then unable to close the subsidiary side of the pseudo-tty. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see z/OS C/C++ Runtime Library Reference.

#### **FSUM2165I**

ı

This error message appears along with FSUM2149I to provide additional information. The system found a free manager pseudo-pty. It then tried to issue fcntl() to set the close-on-exec flag (FD\_CLOEXEC) for the manager pseudo-tty, and fcntl() returned this error. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see z/OS C/C++ Runtime Library Reference.

In the message text:

#### close-file-descriptor

The file descriptor that was passed to close() when this error occurred.

## TTY-name

The pseudo-tty name that was in use when this error occurred.

#### close-return-value

The return value from close().

## close-errno-decimal

The errno value, in decimal, returned from close().

#### close-errno-hex

The errno value, in hexadecimal, returned from close().

#### close-reason-code

The reason code returned from close().

#### system-message

The system message corresponding to the returned errno value.

# fcntl-file-descriptor

The file descriptor that was passed to fcntl() when this error occurred.

#### fcntl-return-value

The return value from fcntl().

#### fcntl-errno-decimal

The errno value, in decimal, returned from fcntl().

#### **FSUM** messages

#### fcntl-errno-hex

The errno value, in hexadecimal, returned from fcntl().

#### fcntl-reason-code

The reason code returned from fcntl().

# **System action**

The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

# System programmer response

For an explanation of the errno and reason code from fcntl() or close(), see z/OS C/C++ Runtime Library Reference. Follow any recommended actions for this errno and reason code.

**Note:** The system may have experienced many manager pseudo-TTY fcntl() failures if message FSUM2165I appeared. Only the first failure is reported by an error message. Any fcntl() errors for other manager pseudo-TTY might not be the same.

# **User response**

Contact the system programmer with all the information from all second-level TSO/E messages that appeared with this one.

## FSUM2156I

Function = close(),
file descriptor = close-file-descriptor,
terminal name = 'TTY-name',
return value = close-return-value,
errno = close-errno-decimal
(X'close-errno-hex'),
reason code = close-reason-code,
description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2155I when you press "?". For more information, see FSUM2155I.

## System action

See message FSUM2155I.

## System programmer response

See message FSUM2155I.

## **User response**

See message FSUM2155I.

# FSUM2157I

The pseudo-TTY could not be reset properly after an earlier error. Function = close(),

file descriptor = file-descriptor, terminal name = 'TTY-name', return value = return-value,

errno = errno-decimal (X'errno-hex'),

reason code = reason-code, description = 'system-message'

This is an informational message that appears along with other error messages, FSUM2149I in particular. Those error messages describe an error that prevented the system from using one or more defined manager pseudo-TTY. The system tries to close the unusable manager pseudo-TTY before going on to try the next defined pseudo-TTY. The close() function failed with the error and reason code displayed in the second-level TSO/E message. For an explanation of this error and reason code, see z/OS C/C++ Runtime Library Reference.

The manager pseudo-TTY named in the error message might not be open after this error occurs. There may be more problems with this pseudo-TTY later on.

In the message text:

#### file-descriptor

The file descriptor that was passed to close() when this error occurred.

#### TTY-name

The pseudo-TTY name that was in use when this error occurred.

#### return-value

The return value from close().

#### errno-decimal

The errno value, in decimal, returned from close().

#### errno-hex

The errno value, in hexadecimal, returned from close().

#### reason-code

The reason code returned from close().

#### system-message

The system message corresponding to the returned errno value.

# **System action**

The system continues to try other defined pseudo-TTYs. However, this message appears only when no other pseudo-TTY is usable. The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

# System programmer response

This message contains information about the first error the system found when trying to close a manager pseudo-TTY. For an explanation of this close() error, see <u>z/OS C/C++ Runtime Library Reference</u>. Follow any recommended actions for this errno and reason code.

Note: The system may have experienced many manager pseudo-TTY close() failures. Only the first failure is reported by an error message. Any close() errors for other manager pseudo-TTY might not be the same.

## User response

Contact the system programmer with all the information from all second-level TSO/E messages that appeared with this one.

## FSUM2158I

Function = close(), file descriptor = file-descriptor, terminal name = 'TTY-name', return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

This is a TSO/E secondary message that appears following FSUM2157I when you press "?". For more information, see FSUM2157I.

# System action

See message FSUM2157I.

# System programmer response

See message FSUM2157I.

## User response

See message FSUM2157I.

## FSUM2159I No session was started. This TSO/E user ID has no defined UID.

Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

# **Explanation**

There is no UID defined in the RACF user profile for this TSO/E user ID. z/OS UNIX cannot be used unless a UID is assigned.

In the message text:

#### return-value-hex

The return value from sigprocmask.

#### return-code

The return code, in hexadecimal, from sigprocmask.

#### reason-code

The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

# **System action**

The OMVS command ends and returns to TSO/E without starting a shell session.

## **System programmer response**

Define a UID in the RACF user profile for this TSO/E user ID. For information about setting up user IDs for z/OS UNIX, see Defining z/OS UNIX users to RACF in z/OS UNIX System Services Planning.

To see other suggested actions for the displayed reason code and return code, refer to <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference.

## **User response**

Ask the system programmer to define a UID for this TSO/E user ID.

FSUM2160I	Function = sigprocmask,	
	return value = <i>return-value-hex</i> ,	
	return code = return-code,	
	reason code = reason-code	

This is a TSO/E secondary message that appears following FSUM2159I when you press "?". For more information, see FSUM2159I.

# System action

See message FSUM2159I.

# System programmer response

See message FSUM2159I.

# **User response**

See message FSUM2159I.

#### FSUM2161I

No session was started. This TSO/E user ID is in a group that has no defined GID.Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

# **Explanation**

This TSO/E user ID belongs to a RACF group that has no defined GID. User IDs in this group cannot use z/OS UNIX unless a GID is defined in the RACF group profile.

In the message text:

#### return-value-hex

The return value from sigprocmask.

#### return-code

The return code, in hexadecimal, from sigprocmask.

#### reason-code

The reason code returned from sigprocmask; if this value is zero, there is no reason code available for this error.

# **System action**

The OMVS command ends and returns to TSO/E without starting a shell session.

## **System programmer response**

Define a GID in the RACF group profile for this TSO/E user ID, or reassign the user ID to another group that already has a GID. For information about setting up user IDs and RACF groups for z/OS UNIX, see <u>z/OS UNIX</u> System Services Planning.

To see other suggested actions for the displayed reason code and return code, refer to <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference.

#### User response

Ask the system programmer to set up a GID for this TSO/E user ID.

**FSUM2162I** 

Function = sigprocmask, return value = return-value-hex, return code = return-code, reason code = reason-code

This is a TSO/E secondary message that appears following FSUM2161I when you press "?". For more information, see FSUM2161I.

# System action

See message FSUM2161I.

# System programmer response

See message FSUM2161I.

# **User response**

See message FSUM2161I.

#### FSUM2163I

One or more defined pseudo-TTYs cannot be used.+
Function = open(),
terminal name = 'TTY-name',
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

# **Explanation**

This error message appears along with FSUM2149I to provide additional information. The system was looking for a free pseudo-TTY. When it tried to open the manager side of the pseudo-TTY named in the error message, an open() error occurred. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see z/OS C/C++ Runtime Library Reference.

In the message text:

#### TTY-name

The pseudo-TTY name that was passed to open () when this error occurred.

#### return-value

The return value from open().

#### errno-decimal

The errno value, in decimal, returned from open ().

#### errno-hex

The errno value, in hexadecimal, returned from open().

#### reason-code

The reason code returned from open().

## system-message

The system message corresponding to the returned errno value.

# System action

The system continues to try other defined pseudo-TTYs. However, this message appears only when no other pseudo-TTY is usable. The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

## System programmer response

This message contains information about the first error the system found when trying to open a manager pseudo-TTY. For an explanation of this open () error, see z/OS C/C++ Runtime Library Reference. Follow any recommended actions for this errno and reason code.

Make sure that the manager pseudo-TTY(whose name is displayed in the error message) is defined with the proper permissions and the proper major and minor number.

**Note:** The system may have experienced many manager pseudo-TTY open() failures. Only the first failure is reported by an error message. Any open() errors for other manager pseudo-TTY pseudo-TTYs might or might not be the same.

# **User response**

Contact the system programmer with all the information from all second-level TSO/E messages that appeared with this one.

FSUM2164I	Function = open(),
	terminal name = ' <i>TTY-nαme</i> ',
	return value = <i>return-vαlue</i> ,
	errno = errno-decimal (X'errno-hex'),
	reason code = reason-code,
	description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2163I when you press "?". For more information, see FSUM2163I.

# **System action**

See message FSUM2163I.

## System programmer response

See message FSUM2163I.

## User response

See message FSUM2163I.

FSUM2165I	Function = fcntl(),	
	terminal name = ' <i>TTY-name</i> '',	
	file descriptor = fcntl-file-descriptor,	
	return value = fcntl-return-value,	
	errno = fcntl-errno-decimal	
	(X'fcntl-errno-hex'),	
	reason code = fcntl-reason-code,	
	description = 'system-message'	

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2155I when you press "?". For more information, see FSUM2155I.

# **System action**

See message FSUM2155I.

# System programmer response

See message FSUM2155I.

## **User response**

See message FSUM2155I.

#### FSUM2166I

No session was started. The shell cannot start, because too many processes are already active for this UID. Function = fork(), return value = return-value, errno = errno-decimal(X'errno-hex'), reason code = reason-code, description = 'system-message'

# **Explanation**

When the TSO/E OMVS command or OPEN subcommand was entered, close to the maximum number of processes were already active for this UID. The process required for the shell could not be created. At least two processes must be available for this UID when the TSO/E OMVS command is run. At least one process must be available for this UID when the OPEN subcommand is run.

Each shell session takes up at least one process for this UID. Active z/OS UNIX batch jobs submitted for this TSO/E user ID count as processes for this UID. Other TSO/E user IDs may share the same UID with this TSO/E user ID. If those user IDs are currently using z/OS UNIX, their processes also count toward the maximum allowed for this UID.

In the message text:

#### return-value

The return value from fork().

#### errno-decimal

The errno value, in decimal, returned from fork().

#### errno-hex

The errno value, in hexadecimal, returned from fork().

#### reason-code

The reason code returned from fork().

#### system-message

The system message corresponding to the returned errno value.

## System action

The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

## System programmer response

If required, increase the maximum number of processes allowed for a UID. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see <u>z/OS UNIX System Services</u> Planning.

For an explanation of the errno and reason code from fork(), see z/OS C/C++ Runtime Library Reference. Follow any suggested actions for this errno value and reason code.

## **User response**

Try not to start so many shell sessions. Specify fewer initial sessions on the TSO/E OMVS command.

Wait for any z/OS UNIX batch jobs from this TSO/E user ID to end before reentering the OMVS command or OPEN subcommand. Other TSO/E user IDs may share a common UID with this user ID. Reenter the OMVS command or OPEN subcommand after one of those TSO/E user IDs has finished using z/OS UNIX.

Ask the system programmer to increase the maximum number of processes allowed per UID.

FSUM2167I

Function = fork(), return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2166I when you press "?". For more information, see FSUM2166I.

# **System action**

See message FSUM2166I.

# System programmer response

See message FSUM2166I.

# **User response**

See message FSUM2166I.

#### **FSUM2168I**

No session was started. The shell cannot start, because too many processes are already active in the system. Function = fork(), return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

## **Explanation**

When the OMVS command or OPEN subcommand was entered, close to the maximum number of processes were already active in the system. The process required for the shell could not be created. The system must be able to start at least two more processes before the OMVS command can run. The system must be able to start at least one more process before the OPEN subcommand can run.

In the message text:

#### return-value

The return value from fork().

#### errno-decimal

The errno value, in decimal, returned from fork().

#### errno-hex

The errno value, in hexadecimal, returned from fork().

#### reason-code

The reason code returned from fork().

## system-message

The system message corresponding to the returned errno value.

## **System action**

The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

# System programmer response

If required, increase the maximum number of processes allowed for z/OS UNIX. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see <u>z/OS UNIX System Services</u> Planning.

For an explanation of the errno and reason code from fork(), see z/OS C/C++ Runtime Library Reference. Follow any suggested actions for this errno value and reason code.

# **User response**

Try not to start so many shell sessions. Specify fewer initial sessions on the TSO/E OMVS command.

Retry the TSO/E OMVS command or OPEN subcommand later, when the system is not as busy.

Ask the system programmer to increase the maximum number processes that can be active at one time.

# FSUM2169I Function = fork(),

return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2168I when you press "?". For more information, see FSUM2168I.

## **System action**

See message FSUM2168I.

## System programmer response

See message FSUM2168I.

#### User response

See message FSUM2168I.

FSUM2170I No session was started. The pseudo-TTY could not be set up properly.

Function=grantpt(),

file descriptor = grant-file-descriptor, terminal name = "TTY-name", return value = grant-return-value, errno = grant-errno-decimal

(X'grant-errno-hex'),

reason code = grant-reason-code, description = 'system-message'

Function = unlockpt(),

file descriptor = unlock-file-descriptor.

terminal name ="TTY-name", return value =unlock-return-value, errno =unlock-errno-decimal

(X'unlock-errno-hex')

reason code = unlock-reason-code, description = 'system-message' Function = tcgetattr(), file descriptor = get-file-descriptor. terminal name ="TTY-name", return value = get-return-value, errno = get-errno-decimal (X'get-errno-hex'), reason code = get-reason-code, description ='system-message' Function = tcsetattr(), file descriptor = set-file-descriptor, terminal name ="TTY-name", return value = set-return-value, errno = set-errno-decimal (X'set-errno-hex'), reason code = set-reason-code, description ='system-message'

# **Explanation**

The system obtained a pseudo-TTY to use for the session with the shell. While this pseudo-tty was being prepared, one of four errors occurred:

#### **FSUM2090I**

The OMVS command was unable to change the ownership of the subsidiary pseudo-tty to the real user ID. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see <u>z/OS</u> <u>C/C++ Runtime Library Reference</u> and <u>z/OS UNIX System Services Programming: Assembler Callable Services Reference</u>.

#### **FSUM2120I**

The OMVS command was unable to unlock the manager pseudo-tty. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see <u>z/OS C/C++ Runtime Library Reference</u> and z/OS UNIX System Services Programming: Assembler Callable Services Reference.

#### **FSUM2180I**

The OMVS command was unable to obtain the attributes (termios structure) for the pseudo-TTY. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see z/OS C/C++ Runtime Library Reference.

#### **FSUM2190I**

The OMVS command was unable to place the pseudo-TTY into 3270 control packet mode. For an explanation of the errno and reason code displayed in the second-level TSO/E message, see z/OS C/C++ Runtime Library Reference.

In the message text:

#### grant-file-descriptor

The file descriptor that was passed to grantpt() when this error occurred.

#### TTY-name

The pseudo-TTY name that was in use when this error occurred.

#### grant-return-value

The return value from grantpt().

#### grant-errno-decimal

The errno value, in decimal, returned from grantpt().

#### grant-errno-hex

The errno value, in hexadecimal, returned from grantpt().

#### grant-reason-code

The reason code returned from grantpt().

#### system-message

The system message corresponding to the returned errno value.

#### unlock-file-descriptor

The file descriptor that was passed to unlockpt() when this error occurred.

#### unlock-return-value

The return value from unlockpt().

#### unlock-errno-decimal

The errno value, in decimal, returned from unlockpt().

#### unlock-errno-hex

The errno vale, in hexadecimal, returned from unlockpt().

#### unlock-reason-code

The reason code returned from the unlockpt().

#### get-file-descriptor

The file descriptor that was passed to tcgetattr() when this error occurred.

#### TTY-name

The pseudo-TTY name that was in use when this error occurred.

#### get-return-value

The return value from tcgetattr().

#### get-errno-decimal

The errno value, in decimal, returned from tcgetattr().

#### get-errno-hex

The errno value, in hexadecimal, returned from tcgetattr().

#### get-reason-code

The reason code returned from tcgetattr().

#### system-message

The system message corresponding to the returned errno value.

## set-file-descriptor

The file descriptor that was passed to tcsetattr() when this error occurred.

#### set-return-value

The return value from tcsetattr().

#### set-errno-decimal

The errno value, in decimal, returned from tcsetattr().

#### set-errno-hex

The errno value, in hexadecimal, returned from tcsetattr().

#### set-reason-code

The reason code returned from tcsetattr().

## System action

The shell session is not started. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

## System programmer response

For an explanation of the errno and reason code from grantpt(), unlockpt(), tcgetattr() or tcsetattr(), see z/OS C/C++ Runtime Library Reference. Follow any recommended actions for this errno and reason code.

#### **User response**

Contact the system programmer with the information from the second-level TSO/E message.

#### **FSUM2171I**

The pseudo-TTY could not be closed after trying to record the end of the session.+
Function = close(),
file descriptor = file-descriptor,
terminal name = 'TTY-name',
return value = return-value,
errno = errno-decimal (X'errno-hex'),
reason code = reason-code,
description = 'system-message'

## **Explanation**

The system was unable to close the manager pseudo-tty before returning to TSO/E. The pseudo-TTY named in the second-level TSO/E message may be open or closed at this time. For more information on the errno and reason code from close(), see z/OS C/C++ Runtime Library Reference.

When the next user tries to use this pseudo-TTY, an error may occur.

In the message text:

#### file-descriptor

The file descriptor that was passed to close() when this error occurred.

#### TTY-name

The pseudo-TTY name that was in use when this error occurred.

#### return-value

The return value from close().

#### errno-decimal

The errno value, in decimal, returned from close().

#### errno-hex

The errno value, in hexadecimal, returned from close().

#### reason-code

The reason code returned from close().

#### system-message

The system message corresponding to the returned errno value.

## **System action**

The OMVS command ends the session. The end of this user's session with the z/OS shell has been recorded, unless other error messages appear along with this one. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

## **System programmer response**

For more information about the errno and reason code from close (), see z/OS C/C++ Runtime Library Reference. Follow any suggested actions for this reason code and errno value.

## **User response**

Contact the system programmer with the message number and any information displayed in the second-level TSO/E message.

#### **FSUM2172I**

Function = close(), file descriptor = file-descriptor, terminal name = 'TTY-name', return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code,

#### description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2171I when you press "?". For more information, see FSUM2171I.

# **System action**

See message FSUM2171I.

# System programmer response

See message FSUM2171I.

## **User response**

See message FSUM2171I.

#### **FSUM2173I**

The end of the session may not have been recorded. The recording process could not be canceled, and may still be active. Function = kill(), terminal name = 'TTY-name', process ID = process-id, return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

# **Explanation**

This error message appears along with other error messages, FSUM2189I and FSUM2183I in particular. See the descriptions for those messages for additional information about this error. After starting the logoff recording process, the system had to end the process, using kill(), but the kill() function failed with the displayed errno and reason code. For more information on the errno and reason code from kill(), see z/OS C/C++ Runtime Library Reference.

The logoff recording process might or might not exist after kill(). If message FSUM2189I appeared along with this message, the logoff recording process may have finished as kill() was issued. In this case, there is no real problem, except that the logoff recording process took much longer than it should have.

In the message text:

#### TTY-name

The pseudo-TTY name that was in use when this error occurred.

## process-id

The process ID of the recording process that was passed to kill().

#### return-value

The return value from kill().

#### errno-decimal

The errno value, in decimal, returned from kill().

#### errno-hex

The errno value, in hexadecimal, returned from kill().

#### reason-code

The reason code returned from kill().

## system-message

The system message corresponding to the returned errno value.

# **System action**

OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

The end of this user's session with the shell might not have been recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

## System programmer response

For more information about the errno and reason code from kill(), see <u>z/OS C/C++ Runtime Library Reference</u>. Follow any suggested actions for this reason code and errno value.

# **User response**

Contact the system programmer with the message number and any information displayed in the second-level TSO/E message.

FSUM2174I Function = kill(),

terminal name = 'TTY-name', process ID = process-id, return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2173I when you press "?". For more information, see FSUM2173I.

## **System action**

See message FSUM2173I.

## **System programmer response**

See message FSUM2173I.

### User response

See message FSUM2173I.

#### FSUM2175I

The end of the session was not recorded. The name of the logged-on user could not be determined.

## **Explanation**

The system needs to determine the name of the TSO/E user, so that the end of the session can be recorded. The system invoked the getlogin (BPX1GLG) function, which returned no user name.

# **System action**

OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E. The end of the user's session with the shell is not recorded.

Because the end of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

### **System programmer response:**

## User response

Contact the system programmer.

### **FSUM2176I**

The end of the session was not recorded. The recording process could not start. Function = fork(), terminal name = 'TTY-name', return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

# **Explanation**

The system tried to start the z/OS UNIX process required for the logoff recording program. When fork() was issued, it failed with the errno and reason code displayed in the second-level TSO/E message. For more information on the errno and reason code from fork(), see z/OS C/C++ Runtime Library Reference.

This error can occur if the system is very busy and cannot start any new processes.

In the message text:

#### TTY-name

The pseudo-TTY name that was in use when this error occurred.

#### return-value

The return value from fork().

#### errno-decimal

The errno value, in decimal, returned from fork().

#### errno-hex

The errno value, in hexadecimal, returned from fork().

# reason-code

The reason code returned from fork().

## system-message

The system message corresponding to the returned errno value.

# System action

OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E. The end of the user's session with the shell is not recorded.

Because the end of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

## **System programmer response**

For more information about the errno and reason code from fork(), see <u>z/OS C/C++ Runtime Library Reference</u>. Follow any suggested actions for this reason code and errno value.

## **User response**

Contact the system programmer with the message number and any information displayed in the second-level TSO/E message.

FSUM2177I Function = fork(), terminal name = 'TTY-name', return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2176I when you press "?". For more information, see FSUM2176I.

# **System action**

See message FSUM2176I.

# System programmer response

See message FSUM2176I.

## **User response**

See message FSUM2176I.

### **FSUM2178I**

The end of the session may not have been recorded. The recording process ended, or did not start, and the outcome is unknown.Function = waitpid(), terminal name = 'TTY-name', process ID = process-id

# **Explanation**

The system started the logoff recording process to record the end of this user's session with the shell. However, the system was unable to find out what happened to the logoff recording process. That process apparently disappeared from the system.

In the message text:

#### TTY-name

The pseudo-TTY name that was in use when this error occurred.

#### process-id

The process ID of the recording process that was passed to waitpid().

## **System action**

OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

The end of this user's session with the shell might not have been recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

# System programmer response

waitpid() was issued for the process ID shown in the second-level TSO/E message. waitpid() returned with errno set to ECHILD, indicating that the logoff recording process was no longer in the system. The OMVS command could not get the ending status from the logoff recording process, so its outcome is not known.

Look for any other error messages or abend messages that might appear on the system console. Follow any recommended actions for these messages.

Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

## FSUM2179I

Function = waitpid(), terminal name = 'TTY-name', process ID = process-id

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2178I when you press "?". For more information, see FSUM2178I.

# **System action**

See message FSUM2178I.

# System programmer response

See message FSUM2178I.

## **User response**

See message FSUM2178I.

### **FSUM2180I**

Function = tcgetattr(), file descriptor = get-file-descriptor, terminal name = 'TTY-name', return value = get-return-value, errno = get-errno-decimal (X'get-errno-hex'), reason code = get-reason-code, description = 'system-message'

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2170I when you press "?". For more information, see FSUM2170I.

# **System action**

See message FSUM2170I.

### System programmer response

See message FSUM2170I.

## **User response**

See message FSUM2170I.

#### **FSUM2181I**

The end of the session may not have been recorded. The outcome of the logoff recording process is unknown.Function = waitpid(), terminal name = 'TTY-name', process ID = process-id, return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

The system started the logoff recording process to record the end of this user's session with the shell. However, the system was unable to find out what happened to the logoff recording process. An error occurred when the OMVS command issued waitpid() to get the ending status from the logoff recording process. waitpid() failed with the errno and reason code displayed in the second-level TSO/E message. For an explanation of the errno value and the reason code, see z/OS C/C++ Runtime Library Reference.

In the message text:

#### TTY-name

The pseudo-TTY name that was in use when this error occurred.

### process-id

The process ID of the recording process that was passed to waitpid().

#### return-value

The return value from waitpid().

#### errno-decimal

The errno value, in decimal, returned from waitpid().

#### errno-hex

The errno value, in hexadecimal, returned from waitpid().

#### reason-code

The reason code returned from waitpid().

### system-message

The system message corresponding to the returned errno value.

# **System action**

OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E. The end of this user's session with the shell might not have been recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

### System programmer response

For more information about the errno and reason code from waitpid(), see z/OS C/C++ Runtime Library Reference. Follow any recommended actions for this errno value and reason code.

## **User response**

Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

#### **FSUM2182I**

Function = waitpid(), terminal name = 'TTY-name', process ID = process-id, return value = return-value, errno = errno-decimal (X'errno-hex'), reason code = reason-code, description = 'system-message'

## **Explanation**

This is a TSO/E secondary message that appears following FSUM2181I when you press "?". For more information, see FSUM2181I.

# **System action**

See message FSUM2181I.

# System programmer response

See message FSUM2181I.

## **User response**

See message FSUM2181I.

### FSUM2183I

The end of the session may not have been recorded. The recording process stopped unexpectedly, before completion, so it was canceled.Function = waitpid(), terminal name = 'TTY-name', process ID = process-id, signal = signal-number

# **Explanation**

The system started the logoff recording process to record the end of this user's session with the shell. That process stopped because it received the signal number displayed in the second-level TSO/E message.

This error could have happened if some authorized user entered the kill command to stop the logoff process while it was running.

In the message text:

### TTY-name

The pseudo-TTY name that was in use when this error occurred.

### process-id

The process ID of the recording process that was passed to waitpid().

## signal-number

The number of the signal that caused the logoff recording process to stop. For a list of signal numbers, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

# System action

The logoff recording process is canceled. OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

The end of this user's session with the shell might not have been recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

# System programmer response

Make sure that authorized users do not stop or kill the logoff recording process while it is running. If any other error messages appeared at the system console, follow any recommended actions for those messages.

## **User response**

Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

**FSUM2184I** 

Function = waitpid(), terminal name = 'TTY-name', process ID = process-id, signal = signal-number

This is a TSO/E secondary message that appears following FSUM2183I when you press "?". For more information, see FSUM2183I.

# **System action**

See message FSUM2183I.

# System programmer response

See message FSUM2183I.

# **User response**

See message FSUM2183I.

#### **FSUM2185I**

The end of the session may not have been recorded. The recording process ended unexpectedly, before completion.Function = waitpid(), terminal name = 'TTY-name', process ID = process-id, signal = signal-number

# **Explanation**

The system started the logoff recording process to record the end of this user's session with the shell. That process ended because it received the signal number displayed in the second-level TSO/E message.

This error could have happened if some authorized user issued the kill command to end the logoff process while it was running.

In the message text:

### TTY-name

The pseudo-TTY name that was in use when this error occurred.

### process-id

The process ID of the recording process that was passed to waitpid().

### signal-number

The number of the signal that caused the logoff recording process to end unexpectedly. For a list of z/OS UNIX signal numbers, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

# **System action**

OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

The end of this user's session with the shell might not have been recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

# System programmer response

Make sure that authorized users do not stop or kill the logoff recording process while it is running. If any other error messages appeared at the system console, follow any recommended actions for those messages.

## **User response**

Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

FSUM2186I Function = waitpid(),

terminal name = 'TTY-name', process ID = process-id, signal = signal-number

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2185I when you press "?". For more information, see FSUM2185I.

# **System action**

See message FSUM2185I.

# System programmer response

See message FSUM2185I.

# **User response**

See message FSUM2185I.

FSUM2187I The end of the session was not recorded. The proper location for

recording could not be found.Function = getutxline(),

terminal name = 'TTY-name', user name = user-name, return value = return-value

# **Explanation**

The system was trying to record the end of the user's session with the shell in the /etc/utmpx file. It could not find the record for this user's pseudo-TTY in that file.

In the message text:

### TTY-name

The pseudo-TTY name that was in use when this error occurred.

### user-name

The name of the logged-on user.

### return-value

The return value from getutxline().

# **System action**

OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E. The end of the user's session with the shell is not recorded.

Because the end of the session with the shell was not recorded in the /etc/utmpx file, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

# **System programmer response**

Make sure that the /etc directory is defined, and that /etc/utmpx exists and has the proper permissions. Make sure that /bin/fsumoclo (the logoff recording program) has the SETUID flag set in its directory entry.

For an explanation of the return value from getutxline(), see z/OS C/C++ Runtime Library Reference.

Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

FSUM2188I

Function = getutxline(), terminal name = 'TTY-name', user name = user-name, return value = return-value

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2187I when you press "?". For more information, see FSUM2187I.

# System action

See message FSUM2187I.

# System programmer response

See message FSUM2187I.

## **User response**

See message FSUM2187I.

FSUM2189I

The end of the session might not have been recorded. The recording process took too much time, so it was canceled.

# **Explanation**

The system started the logoff recording process to record the end of this user's session with the shell. That process did not end within the required time limit. Since the TSO/E terminal is locked until the logoff recording process ends, the process was canceled.

The logoff recording process may have hung. It is also possible that the system is extremely slow, and the logoff recording process was not hung.

# **System action**

OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

The end of this user's session with the shell might not have been recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

## **System programmer response**

The logoff recording process may have been hung. This is especially likely if other processes are also hung. Make sure that there is no problem reading and writing the /etc/utmpx file.

If any other error messages appeared at the system console, follow any recommended actions for those messages.

## **User response**

Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

FSUM2190I

Function=grantpt(),

file descriptor = grant-file-descriptor,

terminal name = "TTY-name", return value = grant-return-value, errno = grant-errno-decimal

(X'grant-errno-hex'),

reason code = grant-reason-code, description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2170I when you press "?". For more information, see FSUM2170I.

# **System action**

See message FSUM2170I.

# System programmer response

See message FSUM2170I.

# **User response**

See message FSUM2170I.

FSUM2191I

The end of the session was not recorded. The slot for this terminal could not be updated. Function = pututxline(),

terminal name = 'TTY-name',

errno = errno-decimal (X'errno-hex'), description = 'system-message'

# **Explanation**

The system invoked the logoff recording program to record the end of the user's session with the shell. The pututxline() function failed with the errno value displayed in the second-level TSO/E message. For a description of the errno value, see z/OS C/C++ Runtime Library Reference. The reason code from pututxline() is not available for this error.

In the message text:

### TTY-name

The pseudo-TTY name that was in use when this error occurred.

#### errno-decimal

The errno value, in decimal, returned from pututxline().

#### errno-hex

The errno value, in hexadecimal, returned from pututxline().

#### system-message

The system message corresponding to the returned errno value.

## **System action**

OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

The end of this user's session with the shell was probably not recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

# System programmer response

Make sure that the logoff recording program (/bin/fsumoclo) has the SETUID flag set in the directory entry. Make sure that the /etc/utmpx file has the correct permissions.

Follow any recommended actions for errno values returned from the pututxline() function.

# **User response**

Contact the system programmer with the message number and any error information displayed in the second-level TSO/E messages.

FSUM2192I Function = pututxline(),

terminal name = 'TTY-name',

errno = errno-decimal (X'errno-hex'), description = 'system-message'

# **Explanation**

This is a TSO/E secondary message that appears following FSUM2191I when you press "?". For more information, see FSUM2191I.

See message FSUM2191I.

# System programmer response

See message FSUM2191I.

# **User response**

See message FSUM2191I.

### FSUM2193I

The end of the session was not recorded. The slot for this terminal could not be updated.

## **Explanation**

The system invoked the logoff recording program to record the end of the user's session with the shell. The pututxline() function failed. The errno value and reason code from pututxline() are not available for this error.

# **System action**

OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E.

The end of this user's session with the shell was probably not recorded. If this recording was not completed, certain shell commands may show that this user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

## System programmer response

Make sure that the logoff recording program (/bin/fsumoclo) has the SETUID flag set in the directory entry. Make sure that the /etc/utmpx file has the correct permissions.

Follow any recommended actions for errors from the pututxline() function.

Contact the system programmer with the message number.

### **FSUM2194I**

The end of the session was not recorded. The recording program could not be invokedFunction = execve(), terminal name = 'TTY-name', program name = 'program-name', errno = errno-decimal (X'errno-hex'), description = 'system-message'

# **Explanation**

The system was unable to invoke the logoff recording program. When execve() was issued to invoke the program named in the second-level TSO/E message, an error occurred. The errno value from the failing execve() invocation is displayed in the second-level TSO/E message. For an explanation of the errno value, see z/OS C/C++ Runtime Library Reference. The reason code is not available for this error.

In the message text:

#### TTY-name

The pseudo-TTY name that was in use when this error occurred.

### program-name

The name of the logoff recording program passed to execve().

#### errno-decimal

The errno value, in decimal, returned from execve().

#### errno-hex

The errno value, in hexadecimal, returned from execve().

### system-message

The system message corresponding to the returned errno value.

## **System action**

OMVS ends the shell session. If there are no other active sessions, the OMVS command ends and returns to TSO/E. The end of the user's session with the shell is not recorded.

Because the end of the session with the shell was not recorded in the /etc/utmpx file, certain shell commands may show that this user is still logged on. The problem will clear up when the next user logs in to the shell using the same pseudo-TTY that this user had.

# System programmer response

For more information about the errno value from execve(), see  $\underline{z/OSC/C++RuntimeLibraryReference}$ . Follow any recommended actions for this errno value and reason code.

Make sure that /bin/fsumoclo (the logoff recording program) exists in the file system and that it has the execute permissions set in its directory entry. Also make sure that the SETUID flag is set for /bin/fsumoclo.

## User response

Contact the system programmer, with the error message number and any other error information displayed in the second-level TSO/E message.

### return value = *number*

The return value reported by the system for this error.

## errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

## message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

#### **FSUM2302**

The end of the session was not recorded. An unexpected error occurred. Error code = number, reason code = hexnum, error data = hexnum, error string = 'string'

# **Explanation**

The end of the user's shell session was not recorded because an internal error occurred.

This error message can occur if the /bin/fsumocli, /bin/fsumoclo, or /bin/fsumoclp programs are accidentally run as shell commands. These programs are part of the TSO/E OMVS command and should not be run individually.

In the message text:

#### error code = *number*

The code for this error.

### reason code = hexnum

An additional reason code associated with this error. If this value is zero, there is no additional reason code for this error.

### error data = hexnum

Additional data associated with this error. If this value is zero, there is no additional reason code for this error.

### error string = 'string'

A string of characters that provides additional error information. If this string is empty, no error string is available for this error.

# System programmer response

This might be an error in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

Make sure not to run /bin/fsumocli, /bin/fsumoclo, or /bin/fsumoclp as shell commands.

# FSUM2303

The end of the session was not recorded. The slot (in /etc/utmpx) for this terminal could not be updated. Function = pututxline(), terminal name = 'string', program name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'

## **Explanation**

The logoff recording program tried to record the end of the user's shell session in the /etc/utmpx file. An error occurred when the logoff recording program issued pututxline(). The end of the shell session was probably not recorded. Certain shell commands may show that the user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

In the message text:

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

### program name = 'string'

The name of the logoff recording program.

## errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

## message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# **System programmer response**

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

Make sure that the /etc directory exists and that the that /etc/utmpx exists and has the proper permissions. Make sure that the logoff recording program (named in the error message) has the SETUID flag set in its directory entry.

# **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

### **FSUM2304**

The end of the session was not recorded. The recording program could not get the authority needed to do the recording. Function = seteuid(), terminal name = 'string', program name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

The logoff recording program tried to obtain the authority needed to record the end of the user's shell session in the /etc/utmpx file. An error occurred when the logoff recording program issued seteuid(). The end of the shell session was probably not recorded. Certain shell commands may show that the user is still logged on. The problem clears up when the next user logs in to the shell using the same pseudo-TTY that this user had.

In the message text:

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

## program name = 'string'

The name of the logoff recording program.

#### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## **System programmer response**

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

Make sure that the logoff recording program (named in the error message) has the SETUID flag set in its directory entry.

Provide the system programmer with this message number and any variable information displayed in the message.

## **FSUM2311**

No session was started. An error occurred while the OMVS command was setting up the shell side of the pseudo-TTY. Function = dup2(), file descriptors = number and 0, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

The session with the z/OS shell was not started, because the pseudo-TTY could not be set up as the standard output device (**stdout**) for the shell.

In the message text:

### file descriptors = number and 0

The current and desired file descriptors for the pseudo-TTY. The pseudo-TTY is currently opened at the current file descriptor. The pseudo-TTY cannot be duplicated to become file descriptor 0.

### return value = *number*

The return value reported by the system for this error.

## errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

## message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

## **User response**

z/OS UNIX file descriptor 0 may be in use by an authorized TSO/E program that was still running when the OMVS command or the **OPEN** subcommand was entered. If so, stop that authorized program and reenter the OMVS command or the **OPEN** subcommand.

## **FSUM2312**

No session was started. An error occurred while the OMVS command was setting up the shell side of the pseudo-TTY. Function = dup2(), file descriptors = number and 1, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

The session with the z/OS shell was not started. The pseudo-TTY could not be set up as the standard input device (**stdin**) for the z/OS shell.

In the message text:

### file descriptors = number and 1

The current and desired file descriptors for the pseudo-TTY. The pseudo-TTY is currently opened at the current file descriptor. The pseudo-TTY cannot be duplicated to become file descriptor 1.

#### return value = number

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = *hexnum*

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and <u>z/OS C/C++ Runtime Library Reference</u>.

## **User response**

z/OS UNIX file descriptor 1 may be in use by an authorized TSO/E program that was still running when the OMVS command or **OPEN** subcommand was entered. If so, stop that authorized program, and reenter the OMVS command or **OPEN** subcommand.

### **FSUM2313**

No session was started. An error occurred while the OMVS command was setting up the shell side of the pseudo-TTY. Function = dup2(), file descriptors = number and 2, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

The session with the z/OS shell was not started. The pseudo-TTY could not be set up as the standard error device (**stderr**) for the z/OS shell.

In the message text:

## file descriptors = *number* and 2

The current and desired file descriptors for the pseudo-TTY. The pseudo-TTY is currently opened at the current file descriptor. The pseudo-TTY cannot be duplicated to become file descriptor 2.

### return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see  $\underline{z/OS}$  UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## **System programmer response**

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

z/OS UNIX file descriptor 2 may be in use by an authorized TSO/E program that was still running when the OMVS command or **OPEN** subcommand was entered. If so, stop that authorized program and reenter the OMVS command or **OPEN** subcommand.

### **FSUM2314**

No session was started. An error occurred while the OMVS command was setting up information needed by the shell. Environment variable name = COLUMNS

# **Explanation**

No session was started with the z/OS shell, because OMVS was unable to format the numeric data for the COLUMNS environment variable required by the shell.

# System programmer response

This might be an error in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

### **FSUM2315**

No session was started. An error occurred while the OMVS command was setting up information needed by the shell. Function = setenv(), environment variable name = COLUMNS, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

No session was started with the z/OS shell, because OMVS was unable to set the COLUMNS environment variable required by the shell.

In the message text:

### return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## **System programmer response**

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

#### **FSUM2316**

No session was started. An error occurred while the OMVS command was setting up information needed by the shell. Environment variable name = LINES

# **Explanation**

No session was started with the z/OS shell, because OMVS was unable to format the numeric data for the LINES environment variable required by the shell.

# System programmer response

This might be an error in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

#### **FSUM2317**

No session was started. An error occurred while the OMVS command was setting up information needed by the shell. Function = setenv(), environment variable name = LINES, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

No session was started with the z/OS shell, because OMVS was unable to set the LINES environment variable required by the shell.

In the message text:

#### return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

#### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

### **FSUM2318**

No session was started. An error occurred while the OMVS command was preparing the pseudo-TTY for use by the shell. Function = close(), file descriptor = number, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

No session with the z/OS shell was started, because the OMVS command could not close the pseudo-TTY file descriptor properly. OMVS was trying to close the manager just before invoking the z/OS shell. This problem could occur if there was another TSO/E program running for the same TSO/E user when the OMVS command was entered. That program might have interfered with the use of the file descriptor for the pseudo-TTY.

In the message text:

### file descriptor = number

The file descriptor that was being used when this error occurred.

#### return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

## message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

# **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

### **FSUM2319**

No session was started. The program to start the shell could not be invoked. Function = execl(), program name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

No session was started because OMVS could not invoke the program that starts the z/OS shell.

In the message text:

# program name = 'string'

The name of the program that cannot be executed.

## errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

#### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

Make sure that the program named in the error message is available in the hierarchical file system. Make sure that the program file has the proper permissions so that this user can run it. Make sure that the permissions for the directory containing the program are set properly so this user is allowed access.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

## **FSUM2320**

The starting time of the session could not be recorded. Function = time(), terminal name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

The system could not obtain the current time. It recorded the start of the shell session, but did not include the starting time in the /etc/utmpx. file. This error did not prevent the session from starting.

In the message text:

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

## errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## **System programmer response**

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

### User response

Provide the system programmer with this message number and any variable information displayed in the message.

### **FSUM2321**

No session was started. An error occurred while the OMVS command was setting up information needed by the shell. Function = setenv(), environment variable name = TERM, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

## **Explanation**

No session was started with the z/OS shell, because OMVS was unable to set the **TERM** environment variable required by the shell.

In the message text:

## return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

### **FSUM2322**

No session was started. An error occurred while the OMVS command was preparing the pseudo-TTY for use by the shell. Function = setsid(), return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

## **Explanation**

No session with the z/OS shell was started, because OMVS was unable to become the session leader for the pseudo-TTY.

In the message text:

## return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and <u>z/OS C/C++ Runtime Library Reference</u>.

### **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

## **FSUM2323**

No session was started. An error occurred while the OMVS command was preparing the pseudo-TTY for use by the shell. Function = open(), filename = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

No session with the z/OS shell was started, because OMVS could not reopen the pseudo-TTY after becoming the session leader. It is possible that this error could occur if the OMVS command or OPEN subcommand was entered when other TSO/E programs already had many files open for this TSO/E user.

In the message text:

## filename = 'string'

The filename for the pseudo-TTY that could not be reopened.

## return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

## **User response**

Retry the OMVS command or **OPEN** subcommand when no other TSO/E programs are running to see if this problem goes away. If this problem persists, contact the system programmer.

## **FSUM2324**

The start of the session may not have been recorded. The recording program could not get the authority needed to do the recording.

Function = seteuid(), terminal name = 'string', program name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

The login recording program tried to obtain the authority needed to record the start of the user's shell session in the /etc/utmpx file. An error occurred when the login recording program issued seteuid(). The start of the shell session was probably not recorded. This error did not prevent the session from starting.

Because the start of the shell session may not have been recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

## program name = 'string'

The name of the login recording program.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## **System programmer response**

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

Make sure that the login recording program (named in the error message) has the SETUID flag set in its directory entry.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

#### **FSUM2325**

No session was started. The signaling mechanism between the OMVS command and the shell could not be set up. Function = sigaction(), signal = number, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

No session with the z/OS shell was started, because OMVS was unable to reset the catching status for one of the required signals back to the default action.

In the message text:

### signal = *number*

The number of the signal being set up when this error occurred. For a list of signal numbers, see <u>z/OS UNIX</u> System Services Programming: Assembler Callable Services Reference.

#### return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

### **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

#### **FSUM2326**

The start of the session was not recorded. The recording program could not get the name of the pseudo-TTY for the session. Function = ttyname(), terminal name = 'string', file descriptor = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

The login recording program tried to obtain the name of the pseudo-TTY needed to record the start of the user's shell session in the /etc/utmpx file. An error occurred when the login recording program issued ttyname(). The start of the shell session was not recorded. This error did not prevent the session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

### terminal name = 'string'

The name of the terminal returned by ttyname().

### file descriptor = 'number'

The file descriptor of the pseudo-TTY passed to ttyname().

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

### **FSUM2327**

The start of the session was not recorded. The recording program could not determine the name of the pseudo-TTY for the session. Function = ttyname(), terminal name = 'string', file descriptor = number

# **Explanation**

The login recording program could not separate the pseudo-TTY pathname into the directory name and the pseudo-TTY file name. The start of the session was not recorded in the /etc/utmpx file. This error did not prevent the session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

### terminal name = 'string'

The name of the terminal returned by ttyname().

### file descriptor = 'number'

The file descriptor of the pseudo-TTY passed to ttyname().

## System programmer response

Make sure that the names of pseudo-TTYs used by the TSO/E OMVS command are of the form /dev/ptypNNNN and /dev/ttypNNNN. If the pseudo-TTY name shown in the error message is correct, follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

## **FSUM2328**

No session was started. The signaling mechanism between the OMVS command and the shell could not be set up. Function = sigprocmask(), signal = number, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

No session with the z/OS shell was started. The z/OS shell must receive control with no signals blocked. OMVS was unable to unblock all signals before invoking the z/OS shell.

In the message text:

### signal = number

The number of the signal being set up when this error occurred. For a list of signal numbers, see <u>z/OS UNIX</u> System Services Programming: Assembler Callable Services Reference.

### return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

### System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

## User response

Provide the system programmer with this message number and any variable information displayed in the message.

### FSUM2329

The start of the session was not recorded. The name of the logged-on user could not be determined. Function = getlogin (BPX1GLG), return value = hexnum

## **Explanation**

The login recording program tried to obtain the name of the logged-on user needed to record the start of the shell session in the /etc/utmpx file. An error occurred when the login recording program issued BPX1GLG. The start of the shell session was not recorded. This error did not prevent the session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

#### return value = *hexnum*

The return value reported by the system for this error.

# System programmer response

For more information on the return value displayed in this message, see z/OS C/C++ Runtime Library Reference.

# **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

### **FSUM2331**

The session has ended. Press <Enter> to end OMVS.

# **Explanation**

The session with the z/OS shell has ended. No more input data can be typed into the input area.

## **User response**

If you press the <ENTER> or the <CLEAR> key, or scroll forward, the OMVS command ends and returns to TSO/E. You can also scroll the screen backward, switch to TSO/E, go into subcommand mode, or invoke the help facility.

#### **FSUM2332**

The session has ended. Press <Enter> to scroll forward.

# **Explanation**

The session with the z/OS shell has ended. No more input data can be typed into the input area. MORE... appears on the screen because not all the available output data from the session fits on the screen.

## **User response**

If you press the <ENTER> or the <CLEAR> key, the OMVS command automatically scrolls the screen forward. You can also scroll the screen backward, switch to TSO/E, go into subcommand mode, or invoke the help facility.

## **FSUM2333**

No more input data can be sent to the shell.

## **Explanation**

No more input data can be typed into the input area. The z/OS shell is not accepting any more input data from the terminal, but the session with the shell has not yet ended. New output data from the shell may still appear on the screen.

## **User response**

You can scroll the screen forward or backward, switch to TSO/E, go into subcommand mode, or invoke the help facility. If the session does not soon end by itself, you can go into subcommand mode and enter the **QUIT** subcommand.

**FSUM2334** 

No more input is allowed. Some input data was ignored.

No more input data can be typed into the input area. The z/OS shell is not accepting any more input data from the terminal, but the session with the shell has not yet ended. Some earlier input data could not be sent to the shell, and is now permanently lost. New output data from the shell may still appear on the screen.

# **User response**

You can scroll the screen forward or backward, switch to TSO/E, go into subcommand mode, or invoke the help facility. If the session does not soon end by itself, you can go into subcommand mode and enter the **QUIT** subcommand.

**FSUM2335** 

No more input is allowed. Press <Enter> to scroll forward.

# **Explanation**

No more input data can be typed into the input area. The z/OS shell is not accepting any more input data from the terminal, but the session with the shell has not yet ended. MORE... appears on the screen, because not all the available output data from the session fits on the screen. In addition, new output data from the shell may still appear on the screen.

# **User response**

If you press the <ENTER> or the <CLEAR> key, the OMVS command automatically scrolls the screen forward. You can also scroll the screen backward, switch to TSO/E, go into subcommand mode, or invoke the help facility. If the session does not soon end by itself, you can go into subcommand mode and enter the **QUIT** subcommand.

**FSUM2336** 

A session error occurred. Press <Enter> to end OMVS.

# **Explanation**

An error caused the session with the z/OS shell to end. Earlier error messages may contain more information about this error. No more input data can be typed into the input area.

## **User response**

If you press the <ENTER> or the <CLEAR> key, or scroll forward, the OMVS command ends and returns to TSO/E. You can also scroll the screen backward, switch to TSO/E, go into subcommand mode, or invoke the help facility.

**FSUM2337** 

A session error occurred. Press <Enter> to scroll forward.

# **Explanation**

An error caused the session with the z/OS shell to end. Earlier error messages may contain more information about this error. No more input data can be typed into the input area. MORE... appears on the screen, because not all the available output data from the session fits on the screen.

## **User response**

If you press the <ENTER> or the <CLEAR> key, the OMVS command automatically scrolls the screen forward. You can also scroll the screen backward, switch to TSO/E, go into subcommand mode, or invoke the help facility.

**FSUM2338** 

The session has ended. Press <Enter> for another session.

# **Explanation**

The current session with the z/OS shell has ended. No more input data can be typed into the input area.

If you press the <ENTER> or <CLEAR> key, or scroll forward, the currently displayed session ends, and OMVS automatically displays another session. You can also scroll the screen backward, switch to TSO/E, go into subcommand mode, or invoke the help facility.

**FSUM2339** 

A session error occurred. Press <Enter> for another session.

# **Explanation**

An error caused the session with the z/OS shell to end. Earlier error messages may contain more information about this error. No more input data can be typed into the input area.

# **User response**

If you press the <ENTER> or <CLEAR> key, or scroll forward, the currently displayed session ends, and OMVS automatically displays another session. You can also scroll the screen backward, switch to TSO/E, go into subcommand mode, or invoke the help facility.

**FSUM2340** 

No more input is allowed. Press <Enter> to remove the message.

# **Explanation**

No more input data can be typed into the input area. The z/OS shell is not accepting any more input data from the terminal, but the session with the shell has not yet ended. MORE... appears on the screen because not all the available output data from the session fits on the screen. In addition, new output data from the shell may still appear on the screen.

# **User response**

If you press the <ENTER> or the <CLEAR> key, or scroll forward, the error message is removed from the screen so you can see the entire output area. You can also switch to TSO/E, go into subcommand mode, or invoke the help facility. If the session does not soon end by itself, you can go into subcommand mode and enter the **QUIT** subcommand.

**FSUM2341** 

The session has ended.

## **Explanation**

The session with the z/OS shell has ended. No more input data can be typed into the input area.

## **User response**

You can switch to TSO/E, go into subcommand mode, or return from the help facility.

**FSUM2342** 

A session error occurred.

## **Explanation**

An error caused the session with the z/OS shell to end. Earlier error messages may contain more information about this error. No more input data can be typed into the input area.

## **User response**

You can switch to TSO/E, go into subcommand mode, or return from the help facility.

**FSUM2343** 

The session has ended. Press <Enter> to remove the message.

The session with the z/OS shell has ended. No more input data can be typed into the input area.

# **User response**

If you press the <ENTER> or the <CLEAR> key, or scroll forward, the error message is removed from the screen so you can see the entire output area. You can also switch to TSO/E, go into subcommand mode, or invoke the help facility.

**FSUM2344** 

A session error occurred. Press <Enter> to remove the message.

# **Explanation**

An error caused the session with the z/OS shell to end. Earlier error messages may contain more information about this error. No more input data can be typed into the input area.

# **User response**

If you press the <ENTER> or the <CLEAR> key, or scroll forward, the error message is removed from the screen so you can see the entire output area. You can also switch to TSO/E, go into subcommand mode, or invoke the help facility.

**FSUM2347** 

The input TSO/E command contains incorrect DBCS data. The command was not executed. Incorrect data = string

# **Explanation**

The TSO function key was pressed while incorrect DBCS data was in the input area. This incorrect DBCS string cannot be passed to TSO/E to be run as a command.

In the message text:

### 'string'

Several bytes (in hexadecimal) of incorrect DBCS data from the input area.

## **System programmer response**

If the input data was entered normally, or if this problem occurs and there is no obvious explanation, there may be an error in the terminal or in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting terminal or z/OS UNIX problems.

## **User response**

Enter the TSO/E command again. If the second attempt also fails, try pressing <CLEAR> or <PA2> and then enter the TSO/E command again. If you still cannot enter the TSO/E command, clear out all data in the input area and press the TSO function key to switch to TSO/E. Then reenter the TSO/E command. When the command completes, press <PA1> or <Attention> to return to the shell session.

**FSUM2348** 

'string' is an unknown subcommand.

## **Explanation**

Data was entered in the input field in subcommand mode. This data is not one of the known OMVS subcommands.

In the message text:

### 'string'

The unknown command that was entered.

If you want to see a list of valid OMVS subcommands, enter HELP, ?, or press the Help key. If you want to enter data for the z/OS shell, press the Return key or use the RETURN subcommand to get out of subcommand mode first. If you want to run a TSO/E command, enter the TSO subcommand or use the TSO key.

### **FSUM2349**

The subcommand contains too many words. Words starting with 'string' are incorrect.

# **Explanation**

Data was entered in the input field in subcommand mode. This data contained more than one word. All OMVS subcommands contain only one word.

In the message text:

### 'string'

The second word entered on the command line.

# **User response**

If you want to see a list of valid OMVS subcommands, enter HELP, ?, or press the Help key. If you want to enter data for the z/OS shell, press the Return key or use the RETURN subcommand to get out of subcommand mode first. If you want to run a TSO/E command, enter the TSO subcommand or use the TSO key.

### FSUM2350

The session with the shell ended because of an unexpected I/O error. Function = select(), file descriptor = number, terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

An I/O error occurred while waiting for data from the pseudo-TTY, or for the pseudo-TTY to accept more data. This error caused the session with the z/OS shell to end.

In the message text:

### file descriptor = number

The file descriptor that was being used when this error occurred.

## terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

### return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## **System programmer response**

Make sure that TSO/E commands used while OMVS is switched to TSO/E do not use any file descriptors that were opened by the OMVS command.

If this error occurred shortly after you switched to TSO/E and then returned to the z/OS shell, the TSO/E commands that were invoked may have caused this error. Contact the system programmer with this message number and the variable information displayed in the message.

### FSUM2351

The session with the shell ended because of an unexpected I/O error. Function = read(), file descriptor = number, terminal name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

An I/O error occurred during an attempt to read output data from the pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:

### file descriptor = *number*

The file descriptor that was being used when this error occurred.

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## System programmer response

Make sure that TSO/E commands used while OMVS is switched to TSO/E do not use any file descriptors that were opened by the OMVS command.

## User response

If this error occurred shortly after you switched to TSO/E and then returned to the z/OS shell, the TSO/E commands that were invoked may have caused this error. Contact the system programmer with this message number and the variable information displayed in the message.

### **FSUM2352**

The session with the shell ended because of an unexpected I/O error. Function = write(), file descriptor = number, terminal name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'

## **Explanation**

An I/O error occurred during an attempt to write input data to the pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:

### file descriptor = number

The file descriptor that was being used when this error occurred.

## terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

#### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# **System programmer response**

Make sure that TSO/E commands used while OMVS is switched to TSO/E do not use any file descriptors that were opened by the OMVS command.

## **User response**

If this error occurred shortly after you switched to TSO/E and then returned to the z/OS shell, the TSO/E commands that were invoked may have caused this error. Contact the system programmer with this message number and the variable information displayed in the message.

#### **FSUM2353**

The session with the shell ended because of an unexpected I/O error. Function = read(), file descriptor = number, terminal name = 'string', return value = number

# **Explanation**

An I/O error occurred during an attempt to read output data from the pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:

# file descriptor = *number*

The file descriptor that was being used when this error occurred.

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

### return value = *number*

The return value reported by the system for this error.

## System programmer response

This might be an error in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.

### User response

Provide the system programmer with this message number and any variable information displayed in the message.

#### **FSUM2354**

The session with the shell ended because of an unexpected I/O error. Function = write(), file descriptor = number, terminal name = 'string', return value = number

# **Explanation**

An I/O error occurred during an attempt to write input data to the pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:

### file descriptor = *number*

The file descriptor that was being used when this error occurred.

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

#### return value = *number*

The return value reported by the system for this error.

# System programmer response

This might be an error in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.

# **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

### **FSUM2355**

The session with the shell ended because of an unexpected I/O error.

Function = tcgetattr(), file descriptor = number, terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

An I/O error occurred while trying to obtain the current termios control information for the pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:

## file descriptor = number

The file descriptor that was being used when this error occurred.

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

#### return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

### **System programmer response**

Make sure that TSO/E commands used while OMVS is switched to TSO/E do not use any file descriptors that were opened by the OMVS command.

### **User response**

If this error occurred shortly after you switched to TSO/E and then returned to the z/OS shell, the TSO/E commands that were invoked may have caused this error. Contact the system programmer with this message number and the variable information displayed in the message.

#### **FSUM2356**

No more sessions can be started. Maximum number of sessions = number

# **Explanation**

The **OPEN** subcommand cannot start any more shell sessions. The maximum number of active shell sessions for this user has already been reached. The maximum number of sessions is determined by the value of MAXPROCUSER or CHILD\_MAX. No additional sessions can be started if the number of sessions would exceed MAXPROCUSER/2.

In the message text:

#### number

The maximum number of shell sessions that can be active at one time.

# **User response**

End some other shell session before starting any new sessions.

Ask the system programmer to increase the value of MAXPROCUSER to allow more sessions. The value for MAXPROCUSER should be at least twice the number of active sessions required.

### **FSUM2357**

The session with the shell ended because of an unexpected I/O error.

Function = tcsetattr(), file descriptor = number, terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

An I/O error occurred while trying to reset the current termios control information for the pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:

### file descriptor = *number*

The file descriptor that was being used when this error occurred.

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

#### return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

#### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

### System programmer response

Make sure that TSO/E commands used while OMVS is switched to TSO/E do not use any file descriptors that were opened by the OMVS command.

# **User response**

If this error occurred shortly after you switched to TSO/E and then returned to the z/OS shell, the TSO/E commands that were invoked may have caused this error. Contact the system programmer with this message number and the variable information displayed in the message.

#### **FSUM2358**

The session with the shell ended because of an unexpected I/O error. Function = tcflush(), file descriptor = number, terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

An I/O error occurred when trying to flush data that was queued for the pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:

# file descriptor = *number*

The file descriptor that was being used when this error occurred.

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

### return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

### System programmer response

Make sure that TSO/E commands used while OMVS is switched to TSO/E do not use any file descriptors that were opened by the OMVS command.

### **User response**

If this error occurred shortly after you switched to TSO/E and then returned to the z/OS shell, the TSO/E commands that were invoked may have caused this error. Contact the system programmer with this message number and the variable information displayed in the message.

### **FSUM2359**

TSO/3270 passthrough mode ended abnormally, because unexpected 3270 output data was found. Error code = X'hexnum', Incorrect data: introducer = X'hexnum', request = X'hexnum', length = number

# **Explanation**

The pseudo-TTY was in TSO/3270 passthrough mode when the TSO/E OMVS command found a TSO/3270 passthrough request containing incorrect data. Because of the error, OMVS was unable to fail this request and look for the next request in the data stream. TSO/3270 passthrough mode ended, and the pseudo-TTY was returned to normal operation.

This error can be caused by:

- An error in the TSO/3270 passthrough application that caused it to send an incorrect TSO/3270 passthrough request to the TSO/E OMVS command. The length field could have exceeded 32767, or the first byte of the request might not have been X'FF'.
- An incorrect (too short) length field in the previous TSO/3270 passthrough request. This causes the TSO/E OMVS command to look for the X'FF' byte for the next request in the middle of the 3270 data from the prior request. This is also a TSO/3270 passthrough application error.
- Regular data written to the pseudo-TTY while it was in TSO/3270 passthrough mode. This data would be interpreted as an incorrect TSO/3270 passthrough request. This data could have come from a background job, or from another user who sent a message to the TTY while it was in TSO/3270 passthrough mode.

In the message text:

### Error code = X'hexnum'

The error code passed back to the TSO/3270 passthrough application in the \_\_error field of the response. For more information about this error code, see *z/OS UNIX System Services Programming Tools*.

### Introducer = X'hexnum'

The (presumed) first byte (\_\_ff field) of the failing request. If this byte is not X'FF', it is probably the cause of this error. The first byte of every TSO/3270 passthrough request must be X'FF'.

### request = X'hexnum'

The request code in the \_\_fcn field in the failing request. If the \_\_fcn field is not available, X'00' is displayed, instead. If the introducer is not X'FF', the displayed request code is probably not meaningful.

## length = num

The length field (\_\_1) in the failing request. If the \_\_1 field is not available, 0 is displayed, instead. If the introducer is not X'FF', the displayed length is probably not meaningful. If the introducer is X'FF', and the length field exceeds 32767, the length field is the cause of this error. The length field must always be 32767 or less in TSO/3270 passthrough requests.

# System programmer response

Correct any errors in the TSO/3270 passthrough application that might have caused this problem. Modify the application so that regular TTY data is less likely to interfere when the terminal is in TSO/3270 passthrough mode. For more information about writing TSO/3270 passthrough applications, see <u>z/OS UNIX System Services</u> Programming Tools.

# **User response**

Make sure that no background jobs are running then a TSO/3270 passthrough command is run. Make sure that no other users send you messages while a TSO/3270 passthrough command is running. If neither of these errors caused the problem, contact the system programmer.

# **FSUM2360**

The session with the shell ended because of an unexpected I/O error. Function = ioctl(), command = hexnum, file descriptor = number, terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

### **Explanation**

An I/O error occurred when trying send the SIGWINCH signal to the foreground processes using the pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:

## file descriptor = *number*

The file descriptor that was being used when this error occurred.

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

#### return value = *number*

The return value reported by the system for this error.

#### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

Make sure that TSO/E commands used while OMVS is switched to TSO/E do not use any file descriptors that were opened by the OMVS command.

# User response

If this error occurred shortly after you switched to TSO/E and then returned to the z/OS shell, the TSO/E commands that were invoked may have caused this error. Contact the system programmer with this message number and the variable information displayed in the message.

#### **FSUM2361**

Input data was received from an unexpected area of the screen (row *number*, column *number*). This input data was discarded. You may not have entered in the usual input field.

# **Explanation**

You may have entered input data while the normal OMVS screen was not displayed or was partly overwritten by TSO/E messages. This input data was probably not typed into the normal input field at the bottom of the screen. Make sure all input data is entered in the normal input area at the bottom of the screen.

## System programmer response

If the input data was entered normally, or if this problem occurs and there is no obvious explanation, there may be an error in the terminal or in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting terminal or z/OS UNIX problems.

### **User response**

If the normal OMVS screen is overlaid or blank, you may need to press <PA2> to force OMVS to rewrite the screen before you enter input data.

#### **FSUM2362**

Input data was received from an empty screen. This input data was discarded. You may have entered the data right after you pressed the <Clear> key, and before the OMVS command could refresh the screen.

# **Explanation**

Data was probably entered right after the screen was cleared, and before OMVS had a chance to rewrite the normal screen. Make sure all input data is entered in the usual input area at the bottom of the normal OMVS screen.

# System programmer response

If the input data was entered normally, or if this problem occurs and there is no obvious explanation, there may be an error in the terminal or in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting terminal or z/OS UNIX problems.

## **User response**

If the normal OMVS screen is overlaid or blank, you may need to press <PA2> to force OMVS to rewrite the screen before you enter input data.

### **FSUM2363**

Input data was received from a screen that was not created by OMVS. This input data was discarded. You may have entered the data while the OMVS screen was not being displayed.

# **Explanation**

Data was probably entered right after the OMVS screen was interrupted (by a message, for example) and before OMVS had a chance to rewrite the normal screen. Make sure all input data is entered in the usual input area at the bottom of the normal OMVS screen.

# System programmer response

If the input data was entered normally, or if this problem occurs and there is no obvious explanation, there may be an error in the terminal or in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting terminal or z/OS UNIX problems.

# **User response**

If the normal OMVS screen is overlaid or blank, you may need to press <PA2> to force OMVS to rewrite the screen before you enter input data.

### **FSUM2364**

Too much input data was received. This input data was discarded. You may have entered the data while the normal OMVS screen was partly overlaid with data from the system. If this happens again, press <PA2> to refresh the screen before entering data.

# **Explanation**

Data was probably entered right after the OMVS screen was overlaid (by a message, for example) or cleared, and before OMVS had a chance to rewrite the normal screen. Make sure all input data is entered in the usual input area at the bottom of the normal OMVS screen.

# System programmer response

If the input data was entered normally, or if this problem occurs and there is no obvious explanation, there may be an error in the terminal or in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting terminal or z/OS UNIX problems.

### **User response**

If the normal OMVS screen is overlaid or blank, you may need to press <PA2> to force OMVS to rewrite the screen before you enter input data.

### **FSUM2365**

Data from two or more input fields was received. All the input data was discarded. You may have entered some data outside the normal input field.

# **Explanation**

Data was probably entered right after the z/OS UNIX screen was overlaid (by a message, for example), and before OMVS had a chance to rewrite the normal screen. Some of the data may have been entered in the normal input area, but input data was also typed in somewhere else on the screen. Make sure all input data is entered in the usual input area at the bottom of the normal OMVS screen.

If the input data was entered normally, or if this problem occurs and there is no obvious explanation, there may be an error in the terminal or in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting terminal or z/OS UNIX problems.

## **User response**

If the normal OMVS screen is overlaid or blank, you may need to press <PA2> to force OMVS to rewrite the screen before you enter input data.

**FSUM2366** 

Input data (starting with 'string') was discarded, because the session with the shell ended.

# **Explanation**

Input data was received from the terminal just as the session with the z/OS shell was ending. This data could not be passed to the shell. This is an informational message telling you which data was not seen by the shell.

In the message text:

### 'string'

The start of the input data that could not be passed to the z/OS shell. Data before this (if any) was passed to the shell.

# **User response**

If you want to send this data to the shell, use OMVS to reestablish a session with the shell, and then reenter the data.

**FSUM2367** 

Input data was received when none was expected. This input data was discarded. You may have entered the data as the session with the shell was ending, before OMVS had a chance to remove the input area.

# **Explanation**

OMVS replaced the usual input field on the screen with a message describing the end of the session with the z/OS shell. Input data was then received from the terminal when it was not expected. It is possible that you entered data as the input field was being removed. If so, there is no real problem. The input data cannot be passed to the shell because the session has ended.

# **System programmer response**

If the input data was entered normally, or if this problem occurs and there is no obvious explanation, there may be an error in the terminal or in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting terminal or z/OS UNIX problems.

**FSUM2368** 

The session with the shell ended because of an unexpected I/O error. Function = tcdrain(), file descriptor = number, terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

### **Explanation**

An I/O error occurred when trying to wait for queued data to be read at subsidiary pseudo-TTY. This error caused the session with the z/OS shell to end.

In the message text:

## file descriptor = *number*

The file descriptor that was being used when this error occurred.

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

#### return value = *number*

The return value reported by the system for this error.

## errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

Make sure that TSO/E commands used while OMVS is switched to TSO/E do not use any file descriptors that were opened by the OMVS command.

# **User response**

If this error occurred shortly after you switched to TSO/E and then returned to the z/OS shell, the TSO/E commands that were invoked may have caused this error. Contact the system programmer with this message number and the variable information displayed in the message.

FSUM2370

The shell process ended, but the session did not end automatically. You may need to run the QUIT subcommand to end the session.

# **Explanation**

OMVS was notified that the z/OS shell process ended, but the subsidiary pseudo-TTY was not closed. OMVS
 will not automatically end the session until all processes have closed the subsidiary pseudo-TTY. One or more processes may continue to run indefinitely after the shell ends, before the TTY is closed.

# **User response**

If one of these processes is still reading input data from the terminal, you can continue to use the session. Since the shell has ended, you probably cannot run shell commands.

If the shell session appears to hang up after this message is seen, you can enter subcommand mode and use the QUIT, QUITALL, or CLOSE subcommand to end the session.

FSUM2371

The shell process stopped unexpectedly, without ending. You can run the QUIT subcommand to end the session.

# **Explanation**

OMVS was notified that the z/OS shell process stopped, but it did not exit. Whatever stopped the shell may soon cause it to resume. In this case, there is no problem.

# User response

If the shell session appears to hang up after this message is seen, you can enter subcommand mode and use the QUIT, QUITALL, or CLOSE subcommand to end the session.

**FSUM2372** 

The shell process ended with a nonzero exit status. Exit status = number

# **Explanation**

The z/OS shell exited with a nonzero status value. This is an informational message that is produced when the DEBUG option is specified on the OMVS command. This nonzero exit status might not indicate a problem.

In the message text:

### exit status = *number*

The exit status code from the z/OS shell as reported to OMVS.

#### **FSUM2377**

The start of the session was not recorded. An unexpected error occurred. Error code = number, reason code = hexnum, error data = hexnum, error string = 'string'

# **Explanation**

The start of the shell session was not recorded in the /etc/utmpx file, because an unexpected error occurred. This error did not prevent the session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

This error message can occur if the /bin/fsumocli, /bin/fsumoclo, or /bin/fsumoclp programs are accidentally run as shell commands. These programs are part of the TSO/E OMVS command and should not be run individually.

In the message text:

#### error code = number

The code for this error.

#### reason code = hexnum

An additional reason code associated with this error. If this value is zero, there is no additional reason code for this error.

#### error data = hexnum

Additional data associated with this error. If this value is zero, there is no additional reason code for this error.

### error string = 'string'

A string of characters that provides additional error information. If this string is empty, no error string is available for this error.

### **System programmer response**

This might be an error in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

Make sure not to run /bin/fsumocli, /bin/fsumoclo, or /bin/fsumoclp as shell commands.

#### **FSUM2378**

The start of the session was not recorded. The slot (in /etc/utmpx) for this terminal could not be updated, or a new slot for the terminal could not be created. Function = pututxline(), terminal name = 'string', program name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

The login recording program tried to record the start of the user's shell session in the /etc/utmpx file. An error occurred when the login recording program issued pututxline(). The start of the shell session was probably not recorded. This error did not prevent the session from starting.

Because the start of the shell session may not have been recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

## terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

### program name = 'string'

The name of the login recording program.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

Make sure that the /etc directory exists and that the that /etc/utmpx exists and has the proper permissions. Make sure that the login recording program (named in the error message) has the SETUID flag set in its directory entry.

### **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

#### **FSUM2379**

The start of the session was not recorded. The system could not obtain information about this user from the user database. Function = getpwnam(), user name = string, return value = hexnum, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

The login recording program tried to obtain the name of the logged-on user needed to record the start of the shell session in the /etc/utmpx file. An error occurred when the login recording program issued getpwnam(). The start of the shell session was not recorded. This error did not prevent the session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

### user name = string

The name of the user passed to getpwnam().

#### return value = hexnum

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = *hexnum*

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

#### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and <u>z/OS C/C++ Runtime Library Reference</u>.

Make sure that this user is defined in the user data base, and that the user is defined to z/OS UNIX. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.

# **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

### **FSUM2380**

No session was started. An error occurred while the OMVS command was setting up information needed by the shell. Function = setenv(), environment variable name = string, new value = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

No session was started with the z/OS shell, because OMVS could not set the one of the environment variables required by the shell.

In the message text:

### environment variable name = string

The name of the environment variable that could not be set.

### new value = 'string'

The value that the environment variable could not be set to.

#### return value = *number*

The return value reported by the system for this error.

# errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

# **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

**FSUM2381** 

No session was started. The name of the logged-on user could not be determined. Function = getlogin (BPX1GLG), return value = hexnum

## **Explanation**

No session was started with the z/OS shell, because OMVS could not obtain the name of the logged-on user.

In the message text:

#### return value = hexnum

The return value reported by the system for this error.

# System programmer response

For more information on the return value displayed in this message, see z/OS C/C++ Runtime Library Reference.

# **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

**FSUM2382** 

No session was started. The system could not obtain information about this user from the user database. Function = getpwnam(), user name = string, return value = hexnum, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

## **Explanation**

No session was started with the z/OS shell, because the system could not obtain the entry for this user in the user data base.

In the message text:

#### user name = string

The name of the logged-on user passed to getpwnam().

#### return value = hexnum

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

#### message = 'string'

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

Make sure that this user is defined in the user data base, and that the user is defined to z/OS UNIX. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.

# **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

**FSUM2383** 

No initial directory pathname was specified in the user profile. The home directory is set to root.

# **Explanation**

Because a home directory was not specified in the OMVS segment of the RACF user profile for this user, the system set the home directory to the root directory, /.

# System programmer response

If required, specify a home directory in the OMVS segment of the RACF user profile for this TSO/E user ID. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.

# **User response**

If you need to use a home directory other than the root, ask the system programmer to set up a home directory for this TSO/E user ID.

#### **FSUM2384**

No session was started. The system cannot set the current working directory to the specified home directory for this user ID. Function = chdir(), directory name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

No session was started with the z/OS shell, because the home directory for this TSO/E user ID cannot be made the working directory.

In the message text:

## directory name = 'string'

The home directory specified for this TSO/E user ID.

## return value = *number*

The return value reported by the system for this error.

## errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

## message = 'string'

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

Check that the home directory specified in the RACF user profile for this TSO/E user ID is correct. If this user should not be using the root directory, /, as the home directory, do not default the home directory in the user profile. Make sure that the home directory exists and that the file system containing it is mounted. Also, ensure that the permissions for the home directory allow the TSO/E user ID to search the directory. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.

# **User response**

Make sure the home directory for this TSO/E user ID exists in the file system before you enter the OMVS command. If you do not have authority to create the home directory or to mount the file system containing it, contact the operator or system programmer. If the specified home directory is wrong, ask the system programmer to change it.

#### **FSUM2385**

No session was started. The system cannot obtain required storage. Function = malloc(), bytes requested = number, return value = number

## **Explanation**

No session was started with the z/OS shell, because not enough storage was available.

In the message text:

### bytes requested = *number*

The number of bytes of storage that were not available from malloc().

#### return value = *number*

The return value reported by the system for this error.

## System programmer response

Make sure that this TSO/E user has enough storage to run the OMVS command. Increase the default storage SIZE for this TSO/E user ID, or increase the maximum allowed LOGON storage SIZE value for the TSO/E user ID. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.

### User response

The OMVS command requires more storage than is currently available. To make more storage available:

- Enter the OMVS command directly from the TSO/E READY prompt.
- Enter the OMVS command from a 3270 display with a smaller screen size.
- Specify a larger SIZE value when logging on to TSO/E. If you have already specified the maximum allowed size, contact the system programmer.
- Use the NOSHAREAS option on the TSO/E OMVS command.

#### **FSUM2386**

No shell program was specified in the user profile. The default shell ('string') is used.

### **Explanation**

Because a shell pathname was not specified in the OMVS segment of the RACF user profile for this user, the system used the default shell program.

In the message text:

### ('string')

The name of the default shell program.

If required, specify a shell program in the OMVS segment of the RACF user profile for this TSO/E user ID. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.

## **User response**

If you need to use a shell program other than the default, ask the system programmer to specify a shell program for this TSO/E user ID.

**FSUM2387** 

The start of the session may not have been recorded. The outcome of the recording process is unknown. Function = waitpid(), terminal name = 'string', process ID = number (X'hexnum'), return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

The login recording process did not complete normally. The login recording process was created, but the system could not determine what happened to it. The process may have disappeared from the system before or after completing. The start of the shell session might or might not have been recorded in the /etc/utmpx file. This error does not prevent the shell session from starting.

Because the start of the shell session may not have been recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

# terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

### process ID = number (X'hexnum')

The process ID of the login recording process.

### return value = *number*

The return value reported by the system for this error.

## errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

#### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## **System programmer response**

For more information on the errno and reason code values displayed in this message, see *z/OS UNIX System* Services Programming: Assembler Callable Services Reference and *z/OS C/C++ Runtime Library Reference*.

Look for any other messages that might appear on the system console. Follow any recommended actions for those messages.

### **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

**FSUM2388** 

The start of the session may not have been recorded. The recording process stopped or ended unexpectedly, before completion. Function

= waitpid(), terminal name = 'string', process ID = number (X'hexnum'), status value = number (X'hexnum'), return value = number

# **Explanation**

The login recording process did not complete normally. The start of the shell session might or might not have been recorded properly in the /etc/utmpx file. This error does not prevent the shell session from starting.

Because the start of the shell session may not have been recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

### process ID = number (X'hexnum')

The process ID of the login recording process.

## status value = number (X'hexnum')

The status value from waitpid() for the login recording process. For information about the status value, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

#### return value = *number*

The return value reported by the system for this error.

## System programmer response

Make sure that authorized users do not stop or kill the login recording process while it is running. If any other messages appeared at the system console, follow any recommended actions for those messages.

# **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

**FSUM2389** 

The message catalog cannot be used. catalog name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

The OMVS command could not open the message catalog named in the error message. This error does not prevent the session from starting. Default error messages are substituted for the messages in the message catalog. These substituted messages might not contain the usual wording.

In the message text:

### catalog name = 'string'

The name of the message catalog that could not be opened.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

Check that the message catalog named in the error message is installed, and that this user has read access to the message catalog. Make sure that the user has search permission for all the directories leading to the message catalog.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

**FSUM2390** 

The message catalog cannot be closed. catalog name = 'string', errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

The OMVS command could not close the message catalog named in the error message. This error does not prevent the session from starting.

In the message text:

### catalog name = 'string'

The name of the message catalog that could not be closed.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

# message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

### System programmer response

Check that the message catalog named in the error message is installed and that this user has read access to the message catalog. Make sure that the user has search permission for all the directories leading to the message catalog.

### User response

Provide the system programmer with this message number and any variable information displayed in the message.

**FSUM2391** 

The start of the session was not recorded. The recording program could not start, because too many processes were already active for this UID. Function = fork(), terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

When the TSO/E OMVS command or **OPEN** subcommand was entered, close to the maximum number of processes were already active for this UID. Because of this, the process required for the login recording could not be created. At least three processes must be available for this UID when the TSO/E OMVS command is run. At least two processes must be available for this UID when the OPEN subcommand is run.

Each shell session takes up at least one process for this UID. Active z/OS UNIX batch jobs submitted for this TSO/E user ID count as processes for this UID. Other TSO/E user IDs may share the same UID with this TSO/E

user ID. If those user IDs are currently using z/OS UNIX, their processes also count toward the maximum allowed for this UID.

The start of the shell session is not recorded. This error does not prevent the shell session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

## terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

#### return value = *number*

The return value reported by the system for this error.

#### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

If required, increase the maximum number of processes allowed for a UID. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see <u>z/OS UNIX System Services</u> Planning.

# **User response**

Try not to start so many shell sessions. Specify fewer initial sessions on the TSO/E OMVS command.

Wait for any z/OS UNIX batch jobs from this TSO/E user ID to end before reentering the OMVS command or **OPEN** subcommand. Other TSO/E user IDs may share a common UID with this user ID. Reenter the OMVS command or **OPEN** subcommand after one of those TSO/E user IDs has finished using z/OS UNIX.

Ask the system programmer to increase the maximum number of processes allowed per UID.

#### **FSUM2392**

The start of the session was not recorded. The recording program could not start, because too many processes were already active in the system. Function = fork(), terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

When the TSO/E OMVS command or **OPEN** subcommand was entered, close to the maximum number of processes were already active in the system. Because of this, the process required for the login recording could not be created. The system must be able to start at least three more processes before the TSO/E OMVS command can run. The system must be able to start at least two more process before the OPEN subcommand can run.

The start of the shell session was not recorded. This error does not prevent the shell session from starting.

#### **FSUM** messages

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

# terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

#### return value = *number*

The return value reported by the system for this error.

#### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

# message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

If required, increase the maximum number of processes allowed for z/OS UNIX. This number is specified in the parmlib member for z/OS UNIX. For information about configuring z/OS UNIX, see <u>z/OS UNIX System Services</u> Planning.

# **User response**

Try not to start so many shell sessions. Specify fewer initial sessions on the TSO/E OMVS command.

Retry the TSO/E OMVS command or OPEN subcommand later, when the system is not so busy.

Ask the system programmer to increase the maximum number processes that can be active at one time.

### **FSUM2393**

The start of the session was not recorded. The process required for the login recording program could not be created. Function = fork(), terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

The OMVS command could not create the process required for the login recording program. The start of the shell session is not recorded. This error does not prevent the shell session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

# return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

## **User response**

Try the OMVS command or **OPEN** subcommand again. If this problem persists, contact the system programmer with this message number and all the variable information displayed in the message.

#### **FSUM2394**

The start of the session was not recorded. The recording program could not be invoked. Function = execve(), program name = 'string', terminal name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

OMVS could not invoke the login recording program named in the error message. The start of the shell session could not be recorded in the /etc/utmpx file. This error did not prevent the session from starting.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

### program name = 'string'

The name of the login recording program that could not be invoked.

### terminal name = 'string'

The name of the pseudo-TTY that was being used when this error occurred.

#### return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = *hexnum*

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

### System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

Check that the login recording program named in the error message is installed properly. Make sure that this program file has the execute permissions set properly so this user ID can run it. Also make sure that the SETUID flag is set in the directory entry for this program.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

## **FSUM2395**

No session was started. The NOSHAREAS option on the TSO/E OMVS command must be used to run the specified shell program. Function = execve(), program name = 'string', return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

No session was started with the z/OS shell, because OMVS could not invoke the shell program. The SHAREAS option of the TSO/E OMVS command was used or defaulted. OMVS cannot run the specified shell program in the same address space, because the shell is a SETUID or SETGID program.

In the message text:

### program name = 'string'

The name of the shell program that could not be invoked.

#### return value = *number*

The return value reported by the system for this error.

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

## System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

Check that the shell program specified in the RACF user profile for this TSO/E user ID is correct. If the shell program is not a SETUID or SETGID program, make sure that the SETUID and SETGID flags are off in the directory entry for the shell. Make sure that the UID and GID for the shell program are correct. Also make sure that the UID and GID for the TSO/E user ID are correct. For information about setting up user IDs for z/OS UNIX, see z/OS UNIX System Services Planning.

# **User response**

Rerun the TSO/E OMVS command using the NOSHAREAS option.

Make sure the shell program named in the error is correct. If not, ask the system programmer to change the shell program for this user ID.

#### **FSUM2396**

No session was started. The shell program could not be invoked.

Function = execve(), program name = 'string', return value = number,
errno = number (X'hexnum'), reason code = hexnum, message = 'string'

## **Explanation**

No session was started with the z/OS shell, because OMVS could not invoke the shell program.

In the message text:

### program name = 'string'

The name of the shell program that could not be invoked.

### return value = *number*

The return value reported by the system for this error.

## errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

### message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

Check that the shell program specified in the RACF user profile for this TSO/E user ID is correct. Make sure that the shell program exists, and that the file system containing it is mounted. Make sure that the permissions for the shell program allow this user ID to run it. Make sure all the directories leading to the specified shell program can be searched by the user. For information about setting up user IDs for z/OS UNIX, see <u>z/OS UNIX System</u> Services Planning.

# **User response**

Check that the shell program named in the error message exists in the file system before you enter the OMVS command. Make sure the file system containing the shell program is mounted. If you do not have the authority to put the shell program in the file system or mount the file system containing it, contact the operator or system programmer. If you need to run a different shell program, ask the system programmer to change the shell program for your user ID.

### **FSUM2397**

No session was started. An unexpected error occurred. Error code = number, return value = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

# **Explanation**

No session was started with the z/OS shell, because a z/OS UNIX C function failed with an unexpected error. The error code displayed in the message indicates which z/OS UNIX C function failed.

In the message text:

## error code = number

The error code shows which function failed.

```

## return value = *number*

The return value reported by the system for this error.

# errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

### reason code = *hexnum*

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

## message = 'string'

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

#### **FSUM2398**

No session was started. An unexpected error occurred. Error code = number, reason code = hexnum, error data = hexnum, error string = 'string'

# **Explanation**

No session was started with the z/OS shell, because an internal error occurred.

This error message can occur if the /bin/fsumocli, /bin/fsumoclo, or /bin/fsumoclp programs are accidentally run as shell commands. These programs are part of the TSO/E OMVS command and should not be run individually.

In the message text:

### error code = number

The code for this error.

#### reason code = hexnum

An additional reason code associated with this error. If this value is zero, there is no additional reason code for this error.

#### error data = hexnum

Additional data associated with this error. If this value is zero, there is no additional reason code for this error.

### error string = 'string'

A string of characters that provides additional error information. If this string is empty, no error string is available for this error.

## System programmer response

This might be an error in z/OS UNIX. Follow the usual problem determination procedures for diagnosing and reporting z/OS UNIX problems.

### **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

Make sure not to run /bin/fsumocli, /bin/fsumoclo, or /bin/fsuoclp as shell commands.

### **FSUM2399**

No session was started. The name of the pseudo-TTY for the session could not be determined. Function = ttyname(), terminal name = 'string', file descriptor = number, errno = number (X'hexnum'), reason code = hexnum, message = 'string'

## **Explanation**

The login program tried to obtain the name of the pseudo-TTY used for the shell session. An error occurred when the login program issued ttyname(). The shell session did not start.

Because the start of the shell session was not recorded in the /etc/utmpx file, certain shell commands may show that the user is not logged on. This problem clears up when the next user logs on to the shell using the same pseudo-TTY this user had.

In the message text:

# terminal name = 'string'

The name of the terminal returned by ttyname().

### file descriptor = 'number'

The file descriptor of the pseudo-TTY passed to ttyname().

### errno = number (X'hexnum')

The errno value returned by the system for this error. For more information about this errno value, see z/OS C/C++ Runtime Library Reference. If errno = 0, no errno information is available from the system for this error.

#### reason code = hexnum

The reason code returned by the system for this error. For more information about this reason code, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

## message = 'string'

A system error message that describes this error as reported by errno. If errno = 0, this message is not meaningful.

# System programmer response

For more information on the errno and reason code values displayed in this message, see <u>z/OS UNIX System</u> Services Programming: Assembler Callable Services Reference and z/OS C/C++ Runtime Library Reference.

## **User response**

Provide the system programmer with this message number and any variable information displayed in the message.

#### FSUM3002

When using the output file option (-o), specify a filename.

# **Explanation**

The -o option requires an option-argument that is the name of an output file to be created by c89. This filename can be a pathname or a data set and member name that begins with two slashes.

## **User response**

Reenter the c89 command and specify an output filename to be used with the -o option. For example:

```
c89 -o myprog myprog.c

c89 -o "//myload(myprog)" myprog.c

c89 -c -o /tmp/myprog.o myprog.c
```

## **FSUM3005**

When using the library directory option (-L), specify a directory pathname.

# **Explanation**

The -L option requires an option-argument that is the pathname of a directory to be used when c89 searches for archive libraries. c89 uses that name when searching for library names specified with the -1 operand.

# **User response**

Reenter the c89 command and include a library directory pathname after the -L option. For example:

c89 -L mylib myprog.c -l mine

**FSUM3007** 

string is not a valid option.

# **Explanation**

The indicated option is not a valid c89 option. To see the valid c89 options, enter the c89 command without any arguments. For the command description, see  $\underline{c89}$  — Compiler invocation using host environment variables in z/OS UNIX System Services Command Reference.

In the message text:

string is the option name.

# **User response**

Reenter the c89 command and specify a valid option.

**FSUM3008** 

Specify a file with the correct suffix (.string1, .string2, .string3, .string4, .string5, .string6, .string7, or .string8), or a corresponding data set name, instead of string9.

# **Explanation**

The c89 command can process either operands whose path names end with the .c, .i, .s, .o, .x, .p, .I , or .a suffix, or a corresponding data set name that begins with two slashes. The indicated string is not in either form.

In the message text:

string1 is the C source file suffix. string2 is the preprocessed file suffix. string3 is the Assembler source file suffix. string4 is the object file suffix. string5 is the definition side deck file suffix. string6 is the Prelinker output file suffix. string7 is the IPA Link output file suffix. string8 is the archive file suffix. string9 is the incorrect file name.

# **User response**

Reenter the c89 command and specify a valid pathname or data set name. With the appropriate form, c89 can process the following:

- C source files (.c or .i suffix, or corresponding C source data set name)
- MVS assembler source files (.s suffix, or corresponding assembler source data set name)
- Object files produced by compiling with the c89 command (. osuffix, or corresponding object data set name)
- Object files of IMPORT statements, produced by the linkedit phase with the -Wl,dll option, when processing a DLL which exports symbols (.x suffix, or corresponding object data set name)
- Composite object files optionally produced by the PRELINK step of the linkedit phase of the c89 command (.psuffix, or corresponding object data set name)
- IPA linker object files optionally produced by the IPALINK step of the linkedit phase of the c89 command (.I suffix, or corresponding object data set name)
- Archive files such as those produced by the ar command ( .a suffix, or corresponding library data set name)

The c89 command can also process files which do not match any of the preceding forms. By setting the environment variable {\_EXTRA\_ARGS} to a value of 1, such files will be processed during link-editing. The c89 command will use information in addition to the suffix of the file to determine that the file is to be processed as an object file or as a library.

**FSUM3009** 

When using the library operand (-l), specify a library name.

# **Explanation**

The -1 operand requires an option-argument that is the name of a library. c89 uses that name when it searches for the corresponding archive file to be used during link-editing.

# **User response**

Reenter the c89 command and specify a library name to be used with the -1 operand. For example:

c89 myprog.c -1 mine

#### **FSUM3010**

Specify a file with the correct suffix (.string1, .string2, .string3, .string4, .string5, .string6, .string7, .string8, .string9, .string10, or .string11), or a corresponding data set name,

instead of string12.

# **Explanation**

The c++ command can process either operands whose pathnames end with the .C, .hh, .i, .c, .i, .s, .o, .x, .p, .I, or .a suffix, or a corresponding data set name that begins with two slashes. The indicated string is not in either form.

In the message text:

string1 is the C++ source file suffix. string2 is the Class Library Inline file suffix. string3 is the C++ preprocessed file suffix. string4 is the Template Instantiation file suffix. string5 is the C preprocessd file suffix. string6 is the MVS assembler source file suffix. string7 is the object file suffix. string8 is the definition side deck file suffix. string9 is the Prelinker output file suffix. string10 is the IPA Link output file suffix. string11 is the archive file suffix. string12 is the incorrect file name.

# **User response**

Reenter the c++ command and specify a valid pathname or data set name. With the appropriate form, c++ can process the following. Note that in order for c++ to process C .i suffix files, either or both the C and C++ default .i suffix must be modified:

- C++ source files (.C, .hh , or .i suffix, or corresponding C++ source data set name)
- C source files (.c or .i suffix, or corresponding C source data set name)
- MVS assembler source files (.s suffix, or corresponding assembler source data set name)
- Object files produced by compiling with the c++ command (.o suffix, or corresponding object data set name)
- Object files of IMPORT statements, produced by the linkedit phase with the -Wl,dll option, when processing a DLL which exports symbols (.x suffix, or corresponding object data set name)
- Composite object files optionally produced by the PRELINK step of the linkedit phase of the c++ command (.p suffix, or corresponding object data set name)
- IPA linker object files optionally produced by the IPALINK step of the linkedit phase of the c++ command (.Isuffix, or corresponding object data set name)
- Archive files such as those produced by the ar command (.a suffix, or corresponding library data set name)

The c++ command can also process files which do not match any of the preceding forms. By setting the environment variable {\_EXTRA\_ARGS} to a value of 1, such files will be processed during link-editing. The c++ command will use information in addition to the suffix of the file to determine that the file is to be processed as an object file or as a library.

Alternatively, the -+ option of the c++ command can be used. It overrides the {\_EXTRA\_ARGS} environment variable. It causes all C source files, as well as any files which are not of any of the preceding forms, to be processed as C++ source files.

**FSUM3012** 

Specify at least one source, archive, or object operand to be processed.

# **Explanation**

The c89 command requires that you specify at least one operand of the pathname form. Otherwise, c89 has nothing that it can process. A library operand of the -1 form alone is not enough input for c89.

# **User response**

Reenter the c89 command and specify at least one operand of the pathname form. For example:

c89 myprog.c

#### **FSUM3015**

You cannot specify a data set as a library directory. Specify a valid library directory pathname instead of the data set *string*.

# **Explanation**

When using the -L option, you can specify only a pathname as a library directory. You cannot specify a data set, because other data sets are not found in directories. If you are trying to specify a C/370 object library to be used as a library by c89, specify that data set name as an argument on the -1 operand. This is analogous to specifying an archive file pathname (for which c89 also does not perform a library directory search).

In the message text:

string is the data set name.

# **User response**

Reenter the c89 command and specify a library directory pathname after the -L option. For example:

c89 -L mylib myprog.c -l mine

Or, specify a data set after the -1 operand. For example:

c89 myprog.c -1 //mylib

### **FSUM3017**

Could not compile string. Correct the errors and try again.

# **Explanation**

c89 could not compile the indicated file. You should already have received one or more c89 or C/370 compiler messages (or both) indicating the reason for the failure.

In the message text:

string is the file name.

### **User response**

Correct the errors and then reenter the c89 command.

#### **FSUM3018**

Could not assemble string. Correct the errors and try again.

# **Explanation**

c89 could not assemble the indicated file. You should already have received one or more c89 or MVS assembler messages (or both) indicating the reason for the failure.

In the message text:

string is the file name.

## **User response**

Correct the errors and then reenter the c89 command.

#### FSUM3024

When using the define option (-D), specify a name to be passed to the compiler.

# **Explanation**

The -D option requires an option-argument that is a name. Optionally, after the name, you can specify a value to be used during the compilation as if coded on a #define statement in the C source program.

## **User response**

Reenter the c89 command and specify a name (and, optionally, a value) to be passed to the compiler. (If you do not specify a value, 1 is used.) For example:

c89 -D mydef=2 myprog.c

### **FSUM3028**

When using the undefine option (-U), specify a name.

# **Explanation**

The -U option requires an option-argument that is a name. The option-argument is needed in order to override the specification of the same name on a -D option that was specified either explicitly on the c89 command line, or implicitly by c89 itself. The name is not passed to the compiler. If you also specify a value, c89 ignores it.

# **User response**

Reenter the c89 command and specify a name that is not to be passed to the compiler. For example:

c89 -U \_POSIX1\_SOURCE myprog.c

#### **FSUM3032**

When using the include directory option (-I), specify a directory name.

# **Explanation**

The -I option requires an option-argument that is the name of an include directory. This directory name can be a directory pathname or a data set name that begins with two slashes. The C/370 compiler uses that directory name when searching for a header file specified on a #include statement in the C source file.

# **User response**

Reenter the c89 command and specify the include directory name after the -I option. For example:

c89 -I myinc myprog.c

### **FSUM3033**

Directory *string1* specified by command option *string2* cannot be searched.

## **Explanation**

A directory specified by -I or -L option on the command line can not be searched.

In the message text:

string1 is the directory name. string2 is the option name.

## **User response**

Reenter the c89 command and specify a directory that can be searched.

#### **FSUM3039**

The data definition name *string1* cannot be resolved. Specify a valid data set name instead of *string2*.

# **Explanation**

c89 tried to allocate the indicated data set name dynamically in order to associate it with the indicated data definition. But the dynamic allocation failed because the indicated data set name was incorrect. Some common errors are:

- More than 8 characters were specified for any qualifier of the data set name.
- More than 44 characters were specified for the data set name.
- An incorrect character was specified as part of the data set name.
- A data set name qualifier began with a number.

Unless you enclose the data set name with single quotes, a TSO/E user ID prefix is added to the data set name.

In the message text:

string1 is the data definition name. string2 is the incorrect specification.

# **User response**

Reenter the c89 command and specify a valid data set name. For example:

c89 "//myproj.c(myprog1)"

### **FSUM3040**

The data definition name *string1* cannot be resolved. It does not begin with //[ddname] at *string2*.

# **Explanation**

c89 processed a pseudo-JCL dynamic allocation instruction with incorrect syntax. This is a c89 internal parsing error.

In the message text:

string1 is the data definition name. string2 is the pseudo-JCL dynamic allocation instruction.

## System programmer response

Reenter the c89 command with the -v option, and redirect **stdout** to a file. Keep this pseudo-JCL file and the c89 command specified for problem determination.

### **User response**

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

#### **FSUM3041**

The data definition name *string1* cannot be resolved. It does not begin with //[ddname] DD at *string2*.

# **Explanation**

c89 processed a pseudo-JCL dynamic allocation instruction with incorrect syntax. This is a c89 internal parsing error.

In the message text:

string1 is the data definition name. string2 is the pseudo-JCL dynamic allocation instruction.

Reenter the c89 command with the -v option and redirect **stdout** to a file. Keep this pseudo-JCL file and the c89 command specified for problem determination.

# **User response**

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

**FSUM3042** 

The data definition name *string1* cannot be resolved. Specify a valid data set member name instead of *string2*(*string3*).

# **Explanation**

The c89 command tried to allocate the indicated data set name dynamically and to associate it with the indicated data definition name. The dynamic allocation failed, probably because the indicated data set member name did not have the correct syntax. Some common syntax errors are:

- More than 8 characters were specified for the member name.
- An incorrect character was specified as part of the member name.
- The member name began with a number.

Unless you enclosed the data set name with single quotes, a TSO/E user ID prefix is added to the data set name.

In the message text:

string1 is the data definition name. string2 is the data set name. string3 is the member name.

## **User response**

Reenter the c89 command line and specify a valid data set member name. For example:

c89 "//myproj.c(myprog1)"

**FSUM3043** 

The data definition name *string1* cannot be resolved. Specify balanced parentheses for the data definition at *string2*.

# **Explanation**

c89 processed a pseudo-JCL dynamic allocation instruction with incorrect syntax. This is a c89 internal parsing error

In the message text:

string1 is the data definition name. string2 is the pseudo-JCL dynamic allocation instruction.

### **User response**

Environment variables provide necessary system and operational information to c89. Most likely, the values of one or more of these variables was incorrect. Use the env command to determine which c89 environment variables are incorrectly set. (*z/OS UNIX System Services Command Reference* describes environment variables in the section on the c89 command.)

**FSUM3046** 

The data definition name *string1* cannot be resolved. Specify a numeric *string2* subparameter for *string3* instead of *string4*.

# **Explanation**

c89 processed a pseudo-JCL dynamic allocation instruction with incorrect syntax. This is a c89 internal parsing error. One of the following subparameters had an incorrect value:

### **FSUM** messages

- For the DCB parameter, the keyword subparameters are one of the following:
  - LRECL
  - BLKSIZE
- For the SPACE parameter, the positional subparameters are one of the following:
  - BLKLGTH
  - PRIMARY-QTY
  - SECONDARY-QTY
  - DIRECTORY

In the message text:

string1 is the data definition name. string2 is the subparameter name. string3 is the parameter name. string4 is the incorrect value specified.

# **User response**

Environment variables provide necessary system and operational information to c89. Most likely, the values of one or more of these variables was incorrect. Use the env command to determine which c89 environment variables are incorrectly set. (*z/OS UNIX System Services Command Reference* describes environment variables in the section on the c89 command.)

**FSUM3047** 

The data definition name *string1* cannot be resolved. Specify a valid *string2* subparameter for *string3* instead of *string4*.

# **Explanation**

c89 processed a pseudo-JCL dynamic allocation instruction with incorrect syntax. This is a c89 internal parsing error. One of the following subparameters had an incorrect value:

- For the DISP parameter, the positional subparameters are one of the following:
  - STATUS
  - NORMAL
  - ABNORMAL

In the message text:

string1 is the data definition name. string2 is the subparameter name. string3 is the parameter name. string4 is the incorrect value specified.

### **User response**

Environment variables provide necessary system and operational information to c89. Most likely, the values of one or more of these variables was incorrect. Use the env command to determine which c89 environment variables are incorrectly set. (*z/OS UNIX System Services Command Reference* describes environment variables in the section on the c89 command.)

**FSUM3048** 

The data definition name *string1* cannot be resolved. Specify a valid *string2* subparameter instead of *string3*.

# **Explanation**

c89 processed a pseudo-JCL dynamic allocation instruction with incorrect syntax. This is a c89 internal parsing error. One of the following parameters had an incorrect subparameter:

• DCB

In the message text:

string1 is the data definition name. string2 is the parameter name. string3 is the incorrect value specified.

# **User response**

Environment variables provide necessary system and operational information to c89. Most likely, the values of one or more of these variables was incorrect. Use the env command to determine which c89 environment variables are incorrectly set. (*z/OS UNIX System Services Command Reference* describes environment variables in the section on the c89 command.)

#### **FSUM3049**

The data definition name *string1* cannot be resolved. Specify a valid parameter instead of *string2*.

# **Explanation**

c89 processed a pseudo-JCL dynamic allocation instruction with incorrect syntax. This is a c89 internal parsing error.

In the message text:

string1 is the data definition name. string2 is the incorrect value specified.

# **User response**

The c89 command is configured by the use of environment variables. Most likely, the value of one or more of these environment variables is incorrect. Use the env command to determine which c89 environment variables are incorrectly set. (z/OS UNIX System Services Command Reference describes environment variables in the section on the c89 command.)

**FSUM3050** 

The data definition name *string1* cannot be resolved. Specify a valid *string2* parameter instead of *string3*.

# **Explanation**

c89 processed a pseudo-JCL dynamic allocation instruction with incorrect syntax. This is a c89 internal parsing error. One of the following parameters had an incorrect value:

- DSNTYPE
- PATHOPTS
- PATHMODE

In the message text:

string1 is the data definition name. string2 is the parameter name. string3 is the incorrect value specified.

# **User response**

The c89 command is configured by the use of environment variables. Most likely, the value of one or more of these environment variables is incorrect. Use the env command to determine which c89 environment variables are incorrectly set. (z/OS UNIX System Services Command Reference describes environment variables in the section on the c89 command.)

FSUM3051

The data definition name *string1* cannot be resolved. Specify a valid file instead of *string2*.

# **Explanation**

The c89 command tried to allocate for the indicated file pathname dynamically and to associate it with the indicated data definition name. The dynamic allocation failed because the /dev/fdN pathname associated with the file did not have the correct syntax. Normally this cannot be the case because c89 validates the character special files /dev/fdN for all pathname dynamic allocations before the actual dynamic allocation.

In the message text:

string1 is the data definition name. string2 is the incorrect value specified.

Reenter the c89 command with the -v option and redirect **stdout** to a file. Keep this pseudo-JCL file and the c89 command specified for problem determination.

You can determine the actual /dev/fdN character special file pathname as follows:

- In the pseudo-JCL, find the statements for the failing step.
- Beginning with *N*=3, count all the pathname allocations in the order listed. (Ignore the allocations already in the /dev/fdN format, such as 1 and 2.)

# **User response**

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

FSUM3052

The data definition name *string1* cannot be resolved. The data set was not found. Ensure that data set name *string2* is specified correctly.

# **Explanation**

The c89 command tried to dynamically allocate the data set name indicated and to associate it with the indicated data definition name. The dynamic allocation failed, because the data set indicated could not be found. This is probably because the data set does not exist, or is not correctly cataloged (c89 can only work with cataloged data sets). Note that for data set names specified on the c89 command line, unless the data set name is enclosed in single quotes, a TSO/E user ID prefix is added to the data set name.

In the message text:

string1 is the data definition name. string2 is the data set name.

# **User response**

Reenter the c89 command line and specify an existing data set name. For example:

c89 "//'myuser.myprog.c'"

#### FSUM3053

The data definition name *string1* cannot be resolved. The data set was not found. Ensure that data set and member name *string2*(*string3*) are specified correctly.

# **Explanation**

The c89 command tried to dynamically allocate the indicated data set and member name and to associate it with the indicated data definition name. But the allocation failed, because the indicated data set and member could not be found. This is probably because the data set does not exist, or is not correctly cataloged (c89 can only work with cataloged data sets). Unless you enclose the data set name with single quotes, a TSO/E user ID prefix is added to the data set name.

In the message text:

string1 is the data definition name. string2 is the data set name. string3 is the member name.

### **User response**

Reenter the c89 command and specify an existing data set. For example:

c89 "//'myuser.myproj.c(myprog1)'"

FSUM3054

The data definition name *string1* cannot be resolved. The file was not found. Ensure that file *string2* is specified correctly.

## **Explanation**

The c89 command tried to dynamically allocate for the indicated file pathname and to associate it with the indicated data definition name. But the dynamic allocation failed because the /dev/fdN pathname associated with the indicated file could not be found. Normally this situation does not happen because c89 validates the character special files /dev/fdN for all pathname dynamic allocations before doing the dynamic allocation.

In the message text:

string1 is the data definition name. string2 is the file name.

## System programmer response

Reenter the c89 command with the -v option, redirecting **stdout** to a file. Keep this pseudo-JCL file and the c89 command specified for problem determination.

You can determine the actual /dev/fdN character special file pathname as follows:

- In the pseudo-JCL, find the statements for the failing step.
- Beginning with *N*=3, count all the pathname allocations in the order listed.
- Ignore the allocations already in the /dev/fdN format (such as 1 and 2).

## **User response**

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

**FSUM3055** 

The data definition name *string1* cannot be resolved. Specify a member name for partitioned data set *string2*.

## **Explanation**

The c89 command allocated the indicated data set, for which no data set member was specified, and discovered that it is a partitioned data set. Since c89 knows that this is a reference to a specific part, as opposed to a library, you must specify a data set member name.

For compiler objects, since the name is derived from the source data set name, the source and object data sets must have the same organization (partitioned or sequential).

In the message text:

*string1* is the data definition name. *string2* is the partition data set name.

#### User response

Reenter the c89 command line and specify the data set name with a member name. For example:

```
c89 "//myproj.c(myprog1)"
```

If the source data set and object data set types are not the same, you need to delete (and optionally preallocate) the object data sets so the organizations are the same before reentering the c89 command.

**FSUM3056** 

The data definition name *string1* cannot be resolved. File *string2* could not be opened: *string2* 

#### **Explanation**

c89 tried to open the indicated file pathname and to associate it with the indicated data definition name. However, the file pathname could not be opened. This is usually because the file does not exist, or you do not have permission to use the file.

The error message from the open function is at the end of the c89 message.

#### **FSUM** messages

In the message text:

string1 is the data definition name. string2 is the file name. string2 is the error message.

## **User response**

Reenter the c89 command and specify an existing filename to which you have permission. For example:

c89 myprog.c

**FSUM3057** 

The data definition name *string1* cannot be resolved. An allocation error occurred for *string2* with return code *string3*, error code *string4* hex, and information code *string5* hex.

## **Explanation**

A pseudo-JCL dynamic allocation instruction that was processed by c89 failed. c89 did not recognize the return code, error code, and information code resulting from the dynamic allocation function.

In the message text:

string1 is the data definition name. string2 is the data set name. string3 is the return code. string4 is the error code. string5 is the information code.

## System programmer response

Reenter the c89 command with the -v option, and redirect **stdout** and **stderr** to a file. Keep this pseudo-JCL, error file, and the c89 command specified for problem determination.

You can find the meaning of most dynamic allocation return codes in the chapter on requesting dynamic allocation functions in z/OS MVS Programming: Authorized Assembler Services Guide.

## **User response**

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

**FSUM3058** 

The data definition name *string1* cannot be resolved. Specify only a data set name for sequential data set *string2* instead of member *string3*.

#### **Explanation**

The c89 command allocated the indicated data set, for which the indicated data set member was specified, and discovered that it is a sequential data set. Sequential data sets do not have members.

For compiler objects, since the name is derived from the source data set name, the source and object data sets must have the same organization (partitioned or sequential).

In the message text:

string1 is the data definition name. string2 is the data set name. string3 is the member name.

#### **User response**

Reenter the c89 command line and specify the data set name without a member name. For example:

c89 "//myprog.c"

If the source data set and object data set organizations are not the same, you need to delete (and optionally preallocate) the object data set so the organizations are the same before reissuing the c89 command.

The data definition name *string1* cannot be resolved. Specify only a data set name for partitioned data set *string2* instead of member *string3*.

## **Explanation**

The c89 command allocated the indicated data set, for which the indicated data set member was specified. c89 knows that this should be a reference to a C370LIB object library data set. C370LIB object libraries are specified by giving the data set name only, without referring to any of the data set members. The data set members are automatically included by the Prelinker, as required, during symbol resolution.

In the message text:

string1 is the data definition name. string2 is the data set name. string3 is the member name.

## **User response**

Reenter the c89 command line and specify the C370LIB object library data set name without a member name. For example:

c89 "//myproj.c(myprog)" -l"//mylib"

#### **FSUM3060**

#### Could not open string1: string2

## **Explanation**

The c89 command tried to open the indicated temporary system input stream, but the associated data set could not be opened.

The error message from the open function is at the end of the c89 message.

In the message text:

string1 is the data set name. string2 is the error message.

#### System programmer response

Try to correct the problem based on the error message. If that does not work, reenter the c89 command with the -v option and redirect **stdout** and **stderr** to a file. Keep this pseudo-JCL and error file and the c89 command specified for problem determination.

#### **User response**

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

#### FSUM3061

Could not write record *string1* to *string2* (*string3* bytes were written): *string4* 

## **Explanation**

The c89 command tried to write to the indicated temporary system input stream data set that it opened, but the write failed. (That data set is needed for the prelink and link-edit steps.)

The error message from the write function is at the end of the c89 message.

In the message text:

string1 is the record number. string2 is the file name. string3 is the number of bytes written. string4 is the error message.

#### System programmer response

Try to correct the problem based on the error message. If you do not succeed, reenter the c89 command with the -v option, and redirect **stdout** and **stderr** to a file. Keep this pseudo-JCL and error file and the c89 command specified for problem determination.

#### **User response**

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

#### **FSUM3064**

#### Specify fewer arguments for the string1 step.

## **Explanation**

Too many arguments were passed to the indicated step, where the step is one of the following:

- ASSEMBLE
- COMPILE
- IPACOMP
- TEMPINC
- IPATEMP
- IPALINK
- PRELINK
- LINKEDIT

When a program is invoked dynamically under MVS (such as when c89 calls the compiler), the length of the parameter string is architecturally limited.

Most of the c89 arguments have corresponding parameters to the compiler, prelinker, and linkage editor. Therefore, if you specify fewer arguments to c89, a shorter parameter string is passed. For example, perhaps many -I options were specified, or absolute rather than relative names were used.

In the message text:

string1 is the step name.

#### **User response**

Shorten the length of the arguments for the indicated step. Normally, you can accomplish this by removing one or more c89 options or operands. Alternatively, you may be able to use a more terse syntax, such as specifying relative instead of absolute pathnames.

## **FSUM3065**

#### The string1 step ended with return code string2.

#### **Explanation**

The indicated step completed with a nonzero return code, where the step is one of the following:

- ASSEMBLE
- COMPILE
- IPACOMP
- TEMPINC
- IPATEMP
- IPALINK
- PRELINK
- LINKEDIT

This does not necessarily mean that you need to take action. Normally, another error message from the step precedes this message (for the prelinker, you may need to create a prelink map, such as by using the -V option, to see the associated error message).

If a positive return code less than or equal to the value of the environment variable **{\_ACCEPTABLE\_RC}**; (or its default value), is returned, the final result of the c89 command is not affected.

In the message text:

*string1* is the step name. *string2* is the return code.

## User response

If necessary, correct the error indicated by the preceding message or messages, and reenter the c89 command.

If a preceding message indicates that there is a problem with a *DD:ddname* (such as *DD:SYSLIN*), and it is unclear to which data set or pathname this refers, then reenter the failing c89 command with the -v option to produce pseudo-JCL. To find out which data set or pathname c89 is allocating to that *ddname*, look at the pseudo-JCL of the failing step for a line beginning with the words "//ddname DD". The beginning of each step is identified by the words "//step EXEC".

#### FSUM3066

## The string1 step ended with return code string2: string3

# **Explanation**

The indicated step completed with a nonzero return code, where the step is one of the following:

- ASSEMBLE
- COMPILE
- IPACOMP
- TEMPINC
- IPATEMP
- IPALINK
- PRELINK
- LINKEDIT

The error message from the system function is at the end of the c89 message. Usually this happens because the program used in the indicated step cannot be found. For example, if the compiler program whose name is the value of the environment variable **{\_CNAME}** (or its default value) is not in the search order used for MVS programs, an error results.

In the message text:

string1 is the step name. string2 is the return code. string3 is the error message.

#### System programmer response

Try to correct the problem based on the specific error message associated with the failing step. If you do not succeed, reenter the c89 command with the -v option and redirect **stdout** and **stderr** to a file. Keep this pseudo-JCL and error file and the c89 command specified for problem determination.

#### **User response**

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

**FSUM3067** 

The archive library string cannot be found.

## **Explanation**

c89 tried to find the indicated archive library, first by using the directories specified on all -L options, and then by looking in the "usual places" (/lib and then /usr/lib). The filename used for the search is the archive library name prefixed with lib and suffixed with a. But the archive library either does not exist, or you do not have permission to read it. Normally, this error occurs when the library name is incorrectly specified.

In the message text:

string is the archive library name.

# **User response**

Reenter the c89 command and specify an existing library name to which you have permission. For example:

```
c89 myprog.c -1 m
```

or specify a library directory on the -L option that contains the indicated archive library. For example:

```
c89 -L mylib myprog.c -l mine
```

#### **FSUM3068**

The data definition name *string1* cannot be resolved. Specify the name of a partitioned data set instead of sequential data set *string2*.

# **Explanation**

The c89 command allocated the indicated data set and discovered that it has sequential data set organization. c89 knows that this should be a reference to a specified data set that has partitioned organization.

Certain data sets, such as C370LIB object libraries (specified on the -1 operand) and executable (load) libraries (specified on the -0 option), must always have partitioned organization.

In the message text:

string1 is the data definition name. string2 is the data set name.

## **User response**

Reenter the c89 command line and specify a partitioned data set for the library data set name. For example:

```
c89 "//myproj.c(myprog)" -l"//mylib"
```

or

```
c89 -o"//myload(myprog)" "//myproj.c(myprog)"
```

#### **FSUM3069**

The data definition name *string1* cannot be resolved. Specify the name of a sequential data set instead of partitioned data set *string2*.

#### **Explanation**

The c89 command allocated the indicated data set and discovered that it has partitioned data set organization. c89 was told that this is a reference to a specified data set that has partitioned organization instead of sequential organization, because of the DSORG subparameter specified on the DCB parameter of the environment variable associated with this data set.

In the message text:

string1 is the data definition name. string2 is the data set name.

## **User response**

The c89 command is configured by the use of environment variables. Most likely, the value of one or more of these environment variables is incorrect. Use the env command to determine which c89 environment variables are incorrectly set. (z/OS UNIX System Services Command Reference describes environment variables in the section on the c89 command.)

#### FSUM3070

The data definition name *string1* cannot be resolved. Information for character special file *string2*, needed to allocate file *string3*, cannot be obtained: *string4* Follow local procedures for reporting problems.

## **Explanation**

The c89 command uses the /dev/fdN character special files for all pathname allocations. c89 tried to validate the indicated character special file by using the stat function, but that function failed. c89 cannot use the indicated file without the indicated character special file.

In the message text:

string1 is the data definition name. string2 is the character special file name. string3 is the file name. string4 is the error message.

## System programmer response

Ensure that the **/dev/fdN** character special files were correctly created with the mknod command, and that there are enough of them. For more information about creating the **/dev/fdN** character special files required for c89, refer to z/OS UNIX System Services Planning.

## **User response**

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

#### FSUM3071

The data definition name *string1* cannot be resolved. File *string2*, needed to allocate file *string3*, is not character special. Follow local procedures for reporting problems.

#### **Explanation**

The c89 command uses the **/dev/fdN** character special files for all pathname allocations. c89 validated the indicated character special file, using the stat function, and determined that the indicated file is not a character special file. c89 cannot use the indicated file without the indicated character special file.

In the message text:

string1 is the data definition name. string2 is the character special file name. string3 is the file name.

#### **System programmer response**

Ensure that the **/dev/fdN** character special files were correctly created with the mknod command, and that there are enough of them. For more information about creating the **/dev/fdN** character special files required for c89, refer to z/OS UNIX System Services Planning.

#### User response

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

#### **FSUM3072**

The data definition name *string1* cannot be resolved. Character-special file *string2*, needed to allocate file *string3*, is not major 5. Follow local procedures for reporting problems.

## **Explanation**

The c89 command uses the /dev/fdN character special files for all pathname allocations. c89 validated the indicated character special file, using the stat function, and determined that the indicated character special file does not have the correct major number. c89 cannot use the indicated file without the indicated character special file.

In the message text:

string1 is the data definition name. string2 is the character special file name. string3 is the file name.

#### System programmer response

Ensure that the **/dev/fdN** character special files were correctly created with the mknod command, and that there are enough of them. For more information about creating the **/dev/fdN** character special files required for c89, refer to z/OS UNIX System Services Planning.

## **User response**

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

FSUM3073

The data definition name *string1* cannot be resolved. Character-special file *string2*, needed to allocate file *string3*, is not minor *string4*. Follow local procedures for reporting problems.

# **Explanation**

The c89 command uses the **/dev/fdN** character special files for all pathname allocations. c89 validated the indicated character special file, using the stat function, and determined that the indicated character special file does not have the correct minor number. c89 cannot use the indicated file without the indicated character special file.

In the message text:

string1 is the data definition name. string2 is the character special file name. string3 is the file name. string4 is the minor number.

## System programmer response

Ensure that the **/dev/fdN** character special files were correctly created with the mknod command, and that there are enough of them. For more information about creating the **/dev/fdN** character special files required for c89, refer to z/OS UNIX System Services Planning.

#### **User response**

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

**FSUM3080** 

Specify an argument shorter than string.

## **Explanation**

The c89 command has an internal buffer, which is suitable for any option, option-argument, or operand that is valid for the c89 command. This buffer has a length limitation; the argument (option, option-argument, or operand) was too long. The portion of the argument that c89 could process is indicated in the message.

In the message text:

string is the maximum length.

#### **User response**

Reenter the c89 command and make sure that the argument is not longer than the length indicated in the message.

#### FSUM3081

Specify an argument other than null for argument number string.

## **Explanation**

The c89 command cannot process a null argument (option, option-argument, or operand).

In the message text:

string is the sequence number of the argument.

## **User response**

Reenter the c89 command and make sure that the length of the indicated argument string is greater than zero.

```
| Usage: cc [-CcEFfgOpqrsVv0123]
|-D name[=value]]... [-U name]...

```

#### libname]...

## **Explanation**

This message shows the correct format of the c++ command. It is displayed only when you enter c++ without any arguments.

#### FSUM3102

Specify an output file instead of the source file string.

## **Explanation**

The indicated file has the format of a source file (a pathname with a source file suffix). To prevent the source files from being accidentally erased, this format is not allowed for output files.

In the message text:

string is the source file name.

## **User response**

After the -o option, specify an output filename that does not have a source file suffix. For example:

```
c89 -o myprog.out myprog.c
```

#### **FSUM3103**

Specify an output file instead of the directory file string.

## **Explanation**

The indicated file is a directory file type. A directory file cannot be written to, nor executed, so this type is not allowed for output files.

In the message text:

string is the directory name.

#### **User response**

After the -o option, specify an output filename that is not a directory file type. For example:

```
c89 -o myprog.out myprog.c
```

#### **FSUM3104**

Specify an output file instead of the FIFO special file string.

## **Explanation**

The indicated is a FIFO (first-in-first-out) special file type. Writing to a FIFO requires that another process be reading the FIFO. To prevent unexpected behavior (such as this process waiting for another process to open the file for reading), this type is not allowed for output files.

In the message text:

string is the FIFO special file name.

#### **User response**

After the -o option, specify an output filename that is not a FIFO special file type. For example:

c89 -o myprog.out myprog.c

#### **FSUM3110**

Could not open string1: string2

## **Explanation**

When compiling with optimization level 2, c89 must copy certain files from data sets to HFS files. But c89 could not open the indicated file so it could not copy the corresponding data set to an HFS file.

The error message from the open function is at the end of the c89 message.

In the message text:

string1 is the file name. string2 is the error message.

## System programmer response

Try to correct the problem based on the specific error message. If you do not succeed, reenter the c89 command with the -v option and redirect **stdout** and **stderr** to a file. Keep this pseudo-JCL and error file and the c89 command specified for problem determination.

## **User response**

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

#### **FSUM3111**

#### Could not read string1 when copying to string2: string3

# **Explanation**

When compiling with optimization level 2, c89 must copy certain files from data sets to HFS files. But c89 could not read from the indicated data set, which is an output of the compilation, so it could not copy that data set to an HFS file.

The error message from the read function is at the end of the c89 message.

In the message text:

string1 is the data set name. string2 is the file name. string3 is the error message.

#### System programmer response

Try to correct the problem based on the specific error message. If you do not succeed, reenter the c89 command with the -v option and redirect **stdout** and **stderr** to a file. Keep this pseudo-JCL and error file and the c89 command specified for problem determination.

#### User response

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

#### **FSUM3112**

#### Could not write string1 when copying from string2: string3

# **Explanation**

When compiling with optimization level 2, c89 must copy certain files from data sets to HFS files. But it could not write to the indicated HFS file, which is an output of the c89 command, so c89 could not copy that file from a data set.

The error message from the write function is at the end of the c89 message.

In the message text:

string1 is the data set name. string2 is the file name. string3 is the error message.

## System programmer response

Try to correct the problem based on the specific error message. If you do not succeed, reenter the c89 command with the -v option, and redirect **stdout** and **stderr** to a file. Keep this pseudo-JCL and error file and the c89 command specified for problem determination.

#### **User response**

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

**FSUM3120** 

When using the extensions option (-W), specify a phase code and a list of options.

## **Explanation**

The -W option requires an option-argument which is a comma-separated list, beginning with a phase code, and followed by the phase options. For the IPA phase code (-WI), the phase options are optional. The phase options are passed directly to the specified phase. Specifying the IPA phase code indicates that IPA processing be enabled, otherwise IPA processing is disabled.

For information on valid phase codes and how to specify them, see message FSUM3121.

## **User response**

Reenter the c89 command. After the -W option, specify a phase code, followed by a comma and a series of comma separated options that are to be passed to that phase. In the shell, parentheses within arguments must be escaped, either with a backslash or by quoting the argument. For example:

```
c89 -W "0,lang(extended)" -c myprog.c

c89 -W l,p,map -o myprog myprog.o

c89 -W l,obj -o myprog myprog.c
```

**FSUM3121** 

Specify a valid -W phase code (0 or c=compile, a=assemble, I=IPA, l,p=prelink, l,I=IPA link, l=linkedit) instead of string.

#### **Explanation**

The -W option was not followed by a valid phase code. The -W option requires an option-argument which is a comma-separated list, beginning with a phase code, and followed by the phase options. For the IPA phase code (-WI), and the IPA link step of link phase code (-WI, I), the phase options are optional. The phase options are passed directly to the specified phase. Specifying the IPA phase code or the IPA link step on the link phase code, indicates that IPA processing be enabled, otherwise IPA processing is disabled.

The supported phase codes are as follows:

- Phase codes 0 and c (you can use either) indicate the compile step of the compile phase. These options are also passed to the IPA compile step.
- Phase code a indicates the assemble step of the compile phase.
- Phase code I indicates IPA, both the IPA compile step of the compile phase, and the IPA link step of the link-edit phase.
- Phase code 1 indicates the link-edit step of the link-edit phase.
- Phase code 1, when the first phase option is p (1, p), indicates the prelink step of the link-edit phase.
- Phase code 1, when the first phase option is I (1, I), indicates the IPA link step of the link-edit phase.

In the message text:

string is the incorrect phase code specified.

## **User response**

Reenter the c89 command. After the -W option, specify a phase code, followed by a comma and a series of comma separated options that are to be passed to that phase. In the shell, parentheses within arguments must be escaped, either with a backslash or by quoting the argument. For example:

```
c89 -W"0,lang(extended)" -c myprog.c

c89 -Wl,p,map -o myprog myprog.o

c89 -W I,obj -o myprog myprog.c
```

#### **FSUM3122**

Specify a series of options, separated by commas, for the -W *string* phase.

# **Explanation**

The -W option was not followed by a valid phase code and then by a comma. The -W option requires an option-argument which is a comma-separated list, beginning with a phase code, and followed by the phase options. For the IPA phase code (-WI), the phase options are optional. The phase options are passed directly to the specified phase. Specifying the IPA phase code indicates that IPA processing be enabled, otherwise IPA processing is disabled.

In the message text:

string is the phase code.

# **User response**

Reenter the c89 command. After the -W option, specify a phase code, followed by a comma and a series of comma separated options that are to be passed to that phase. In the shell, parentheses within arguments must be escaped, either with a backslash or by quoting the argument. For example:

```
c89 -W"0,lang(extended)" -c myprog.c

c89 -Wl,p,map -o myprog myprog.o

c89 -W I,obj -o myprog myprog.c
```

#### **FSUM3123**

When using the entry option (-e), specify an entry point symbol.

#### **Explanation**

The -e option requires an option-argument that is the name of the entry point symbol, to which control will be given when the output file program is executed. This symbol can be an L-name symbol, or an S-name symbol that begins with two slashes.

# **User response**

Reenter the c89 command and specify an entry point symbol to be used with the -e option. For example:

```
c89 -e mystart myprog.c

c89 -e //MYSTART myprog.c
```

**FSUM3124** 

When using the unresolved option (-u), specify a symbol to load.

#### **Explanation**

The -u option requires an option-argument that is the name of a symbol which is to be added to the table of unresolved symbols. This symbol can be an L-name symbol, or an S-name symbol that begins with two slashes.

## **User response**

Reenter the c89 command and specify a symbol to load with the -u option. For example:

c89 -u mymain file.a

c89 -u //MYMAIN file.a

FSUM3130 Fork failed: string

# **Explanation**

c89 attempted to fork, and the fork failed.

The error message from the fork function is at the end of the c89 message.

In the message text:

string is the error message.

# System programmer response

Try to correct the problem based on the specific error message. If you do not succeed, reenter the c89 command with the -v option and redirect **stdout** and **stderr** to a file. Keep this pseudo-JCL and error file and the c89 command specified for problem determination.

# User response

Reenter the c89 command. If the problem persists, contact the IBM service representative responsible for your installation.

FSUM3131

Terminated by signal string.

# **Explanation**

c89 was terminated due to a signal.

In the message text:

string is the signal number.

**FSUM3132** 

Terminated by signal string.

#### **Explanation**

-S is ignored because it is not supported for IPA compile.

IPA Compile can not generate an assembler source file, so -S option is ignored.

**FSUM3201** 

Configuration file string is not valid.

#### **Explanation**

An invalid configuration file was specified.

In the message text:

string is the configuration file name.

## **System action**

The processing stops.

## **User response**

Specify a valid configuration file.

#### FSUM3202

Configuration file string cannot be read.

# **Explanation**

Attempt to read the configuration file failed.

In the message text:

string is the configuration file name.

# **System action**

The processing stops.

## **User response**

Check the file for corruption and try again.

#### **FSUM3203**

Configuration file string1 does not contain stanza string2.

# **Explanation**

Required stanza was not found in the configuration file.

In the message text:

string1 is the configuration file name. string2 is the stanza name.

# **System action**

The processing stops.

## **User response**

Ensure that the stanza matching the command name is defined in the configuration file. If the -F flag option is used to override the default stanza, ensure that the overriding stanza is defined in the configuration file.

#### FSUM3204

Configuration file string1 contains incorrect stanza string2.

## **Explanation**

An incorrect stanza was found in the configuration file.

In the message text:

string1 is the configuration file name. string2 is the stanza name.

# **System action**

The processing stops.

#### **User response**

Ensure that the stanza reported in the message is correctly defined in the configuration file.

#### Stanza string1 contains incorrect attribute string2.

## **Explanation**

An incorrect attribute was specified in the configuration file for the reported stanza.

In the message text:

string1 is the stanza name. string2 is the attribute name.

# **System action**

The processing stops.

## **User response**

Correct the attribute specification.

#### **FSUM3206**

Configuration attribute *string1* contains an incorrectly quoted string *string2*.

# **Explanation**

An attribute that requires quotes is missing a quote.

In the message text:

string1 is the attribute name. string2 is the string.

# **System action**

The processing stops.

# **User response**

Ensure that the attribute has matching opening and closing quotes.

#### **FSUM3207**

Configuration option string is missing a subargument.

# **Explanation**

A subargument of the -F flag option or an option specified in the configuration file is missing.

In the message text:

string is the option name.

## **System action**

The processing stops.

#### User response

Ensure that a required subargument is correctly specified.

#### **FSUM3208**

Command option string is missing a subargument.

#### **Explanation**

A subargument of an option specified on the command line is missing.

In the message text:

string is the option name.

# System action

The processing stops.

# **User response**

Ensure that the required subargument is correctly specified.

#### FSUM3209

Configuration option string contains an incorrect subargument.

# **Explanation**

A subargument of an option specified in the configuration file is incorrect.

In the message text:

string is the option name.

# **System action**

The processing stops.

## **User response**

Ensure that the required subargument is correctly specified.

#### FSUM3210

Command option string contains an incorrect subargument.

# **Explanation**

A subargument of an option specified on the command line is incorrect.

In the message text:

string is the option name.

# System action

The processing stops.

#### **User response**

Ensure that the required subargument is correctly specified.

#### FSUM3211

Configuration option string is incorrect for z/OS platform - ignored.

## **Explanation**

An option specified in the configuration file is not supported on z/OS.

In the message text:

string is the option name.

## **System action**

Option is ignored and the processing continues.

#### **User response**

Remove the option from the configuration file.

#### **FSUM3212**

Command option string is incorrect for z/OS platform - ignored.

## **Explanation**

An option specified on the command line is not supported on z/OS.

In the message text:

string is the option name.

# **System action**

Option is ignored and the processing continues.

## **User response**

Remove the option from the command line.

#### **FSUM3215**

Configuration option string is not recognized - passed to ld.

# **Explanation**

An option specified in the configuration file is not recognized as a valid compiler option.

In the message text:

string is the option name.

# **System action**

Option is passed to ld and the processing continues.

#### **User response**

Ensure that the option is correct.

#### **FSUM3216**

Command option string is not recognized - passed to ld.

#### **Explanation**

An option specified on the command line is not recognized as a valid compiler option.

In the message text:

string is the option name.

## System action

Option is passed to ld and the processing continues.

#### User response

Ensure that the option is correct.

#### **FSUM3217**

Configuration option string is incorrect.

# **Explanation**

A flag option specified in the configuration file is incorrect.

436 z/OS: z/OS UNIX System Services Messages and Codes

In the message text:

string is the option name.

## System action

The processing stops.

## **User response**

Ensure that the flag option is correctly specified.

#### **FSUM3218**

File string contains an incorrect file suffix.

## **Explanation**

A file specified on the command line has an incorrect file suffix.

In the message text:

string is the file name.

# **System action**

The processing stops.

# **User response**

Ensure that the suffix is correctly specified, or change the appropriate suffix attribute in the configuration file to match the suffix of the file specified on the command line.

#### **FSUM3219**

Out of space.

## **Explanation**

Required heap space is not available.

## **System action**

The processing stops.

#### **User response**

Increase the region size of the z/OS UNIX session.

#### FSUM3220

The current directory is not writeable.

## **Explanation**

The current directory does not have write permission.

#### System action

The processing stops.

#### **User response**

Add write permission to the current directory.

**FSUM3221** 

Cannot spawn program string1 - string2.

#### **FSUM** messages

## **Explanation**

An attempt to spawn a program failed.

In the message text:

string1 is the program name. string2 is the output of errno or "reason unknown".

## **System action**

The processing stops.

## **User response**

Ensure that there are no system problems.

#### **FSUM3223**

Component character has no program specified.

# **Explanation**

A program that corresponds to the component reported in the message was not specified in the configuration file.

In the message text:

character is a one character component id (c - C/C++ Compiler, a - Assembler, L - IPA Link, l - Binder).

# **System action**

The processing stops.

# **User response**

Add the required program to the configuration file.

#### **FSUM3224**

Fatal error in string: signal number received.

#### **Explanation**

A signal other than SIGHUP, SIGINT, and SIGQUIT was received.

In the message text:

string is the name of the running program. number is the signal id.

#### **System action**

The processing stops.

#### **User response**

Ensure that the system is functioning properly.

#### FSUM3226

Reason unknown.

# **Explanation**

The xlc utility was unable to determine the reason for a spawn error.

#### **User response**

See user response for spawn errors.

Input file string not found.

# **Explanation**

The input file specified on the command line was not found.

In the message text:

string is the file name.

# **System action**

The file is ignored and the processing continues.

## **User response**

Ensure that the name of the input file is correct and the file exists.

#### **FSUM3229**

Compilation ended due to insufficient space.

## **Explanation**

The compile could not finish due to insufficient storage.

# **System action**

The processing stops.

## **User response**

Increase the region size of the z/OS UNIX session.

#### **FSUM3230**

Internal compiler error.

#### **Explanation**

An internal compiler error has occurred.

#### System action

The processing stops.

#### **User response**

Report the error to your Service Representative.

## **FSUM3231**

Unable to find help file.

## **Explanation**

The xlc utility was unable to find the help file.

## **System action**

The processing stops.

#### **User response**

Ensure that the xlc utility is properly installed. If overriding the NLSPATH environment variable, ensure that it includes the location where the help file is installed.

Input file string does not have correct permissions.

# **Explanation**

The input file does not have read permission.

In the message text:

string is the file name.

# **System action**

The processing continues.

## **User response**

Ensure that the input file has proper permissions.

#### **FSUM3238**

Configuration file string does not exist.

# **Explanation**

The reported configuration file does not exist.

In the message text:

string is the configuration file name.

# **System action**

The processing stops.

# **User response**

Provide an existing configuration file.

#### **FSUM3243**

Object file string is not writeable.

#### **Explanation**

The reported object file does not have write permission.

In the message text:

string is the name of the object file.

## **System action**

The processing stops.

## **User response**

Ensure that the object file is writeable.

#### **FSUM3244**

Warning: More than one source file with *string1* and *string2*: *string3* ignored.

# **Explanation**

More than one source file was specified with flag options such as -c and -o.

In the message text:

string1 is the name of the first flag option. string2 and string3 represent the name of the second flag option.

## **System action**

The second flag option is ignored and processing continues.

#### **User response**

Use only one of these flag options on the command line.

**FSUM3247** 

Directory *string1* specified by the configuration file option *string2* cannot be searched.

## **Explanation**

A directory specified by an option in the configuration file can not be searched.

In the message text:

string1 is the directory name. string2 is the option name.

# **System action**

The processing stops.

#### User response

Ensure that the directory can be searched.

**FSUM3248** 

Directory *string1* specified by command option *string2* cannot be searched.

# **Explanation**

A directory specified by an option on the command line can not be searched.

In the message text:

string1 is the directory name. string2 is the option name.

# **System action**

The processing stops.

#### User response

Ensure that the directory can be searched.

#### FSUM3257

Option string is not recognized. Option will be ignored.

# **Explanation**

The reported option was not recognized as a valid option.

In the message text:

string is the option name.

# **System action**

The option is ignored and the processing continues.

#### **User response**

Specify a valid option.

#### **FSUM3265**

Compiler component is not installed or *string1* attribute ( = *string2* ) in the configuration file is incorrect.

## **Explanation**

The reported compiler component is not an existing program.

In the message text:

string1 is the attribute name. string2 is the value assigned to the attribute in the configuration file.

## **System action**

The processing stops.

## **User response**

Ensure that the configuration file attribute for the reported component points to a location that contains the required program.

#### **FSUM3271**

The specified option "-string" does not support suboptions.

# **Explanation**

Most -q options do not support suboptions in a negative form. The negative form of the specified option does not support suboptions. The specified option is invalid.

In the message text:

string is the name of the invalid option.

# **System action**

The processing stops.

#### User response

Remove the suboption or use the positive form of the option and submit the command again.

#### **FSUM3272**

Output file string is not writeable.

#### **Explanation**

The reported output file does not have write permission.

In the message text:

string is the name of the output file.

## **System action**

The processing stops.

#### **User response**

Ensure that the output file is writeable.

**FSUM3273** 

Data set is not a valid suboption, option string is ignored.

## **Explanation**

The reported option does not support data sets.

In the message text:

string is the name of the ignored option.

## **System action**

The option is ignored and the processing continues.

## **User response**

Specify a UNIX file name instead of a data set name.

#### **FSUM3274**

Make dependencies are not supported for data sets, option *string1* is ignored.

## **Explanation**

Make utility does not support data sets in targets or prerequisites. Make dependencies are not generated when either the source or the object file is a data set.

In the message text:

string1 is the ignored option name.

# **System action**

The processing ignores the make depend option and continues.

# User response

Specify a UNIX file for both the source and the object file and recompile.

#### **FSUM3275**

-S is ignored because it is not supported for IPA compile.

### **Explanation**

IPA Compile can not generate an assembler source file, so -S option is ignored.

#### FSUM3401

The assemble step ended with rc = number.

# **Explanation**

Assemble step completed with a non-zero return code.

In the message text:

*number* is the return code from the assemble step.

#### **User response**

This does not necessarily mean that you need to take action. If necessary, correct the error indicated by the preceding messages, and reenter the as command.

#### FSUM3402

Exactly one source file must be specified.

# **Explanation**

The as command requires that you specify exactly one source file. The source file must be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

#### **User response**

Reenter the as command and specify exactly one source file.

#### **FSUM3403**

The PDS string cannot be assembled. Specify a PDS member instead.

## **Explanation**

The indicated input file is a PDS. The as command requires the input source file to be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

In the message text:

string is the name of the input source file.

## **User response**

Reenter the as command and specify a PDS member.

#### **FSUM3404**

The PDSE string cannot be assembled. Specify a PDSE member instead.

## **Explanation**

The indicated input file is a PDSE. The as command requires the input source file to be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

In the message text:

string is the name of the input source file.

## **User response**

Reenter the as command and specify a PDSE member.

#### **FSUM3405**

The VSAM file string cannot be assembled.

## **Explanation**

The indicated input file is a VSAM file. The as command requires the input source file to be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

In the message text:

string is the name of the input source file.

#### User response

Reenter the as command and specify a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

## **FSUM3406**

The block special file string cannot be assembled.

## **Explanation**

The indicated input file is a block special file. The as command requires the input source file to be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

In the message text:

string is the name of the input source file.

#### **User response**

Reenter the as command and specify a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

#### FSUM3407

The character special file string cannot be assembled.

#### **Explanation**

The indicated input file is a character special file. The as command requires the input source file to be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

In the message text:

string is the name of the input source file.

## **User response**

Reenter the as command and specify a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

#### **FSUM3408**

The directory *string* cannot be assembled. Specify a UNIX System Services file instead.

## **Explanation**

The indicated input file is a directory. The as command requires the input source file to be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

In the message text:

string is the name of the input source file.

#### User response

Reenter the as command and specify a UNIX System Services file.

#### **FSUM3409**

The socket file string cannot be assembled.

#### **Explanation**

The indicated input file is a socket file. The as command requires the input source file to be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

In the message text:

string is the name of the input source file.

#### **User response**

Reenter the as command and specify a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

#### **FSUM3410**

The path name of the working directory cannot be determined.

## **Explanation**

The file permissions for the current directory or its parent directories do not have read or search permissions set.

#### **User response**

Ensure that the current directory and its parent directories have read and search permissions set.

The real path for file *string1* cannot be retrieved: errno: *number*, strerror: *string2* 

## **Explanation**

The as command cannot determine the canonicalized absolute path name for the indicated file. The errno is set by realpath().

In the message text:

string1 is the processing file name. number is the errno from realpath(). string2 is the error message associated with errno.

## **User response**

Review the realpath() information in the C/C++ Run-Time Library Reference and use the errno to determine the cause of the error.

#### **FSUM3412**

The file *string1* cannot be opened with attributes: *string2*. errno: *number*, strerror: *string3*.

## **Explanation**

The as command requires permission to open the indicated file with the indicated permission.

In the message text:

string1 is the processing file name. string2 contains the file attributes passed into fopen(). number is the errno set by fopen(). string3 is the error message associated with errno.

## **User response**

If the indicated file already exists on your system, rename the file and reenter the as command. Review the fopen() information in the XL C/C++ Run-Time Library Reference and use the errno to determine the cause of the error.

#### **FSUM3416**

#### DD names passed to assembler:

# **Explanation**

This is the message header for displaying the data definition names that are being passed to the assembler. A list of data definition names will follow this message. The message is issued when the --verbose option is specified for the as command.

#### User response

Reenter the as command without the --verbose option.

#### **FSUM3417**

The DLL string is not found.

#### **Explanation**

The indicated Common Debug Architecture run-time library cannot be found.

In the message text:

string is the name of the Common Debug Architecture run-time library.

#### **User response**

The indicated Common Debug Architecture run-time library should be installed in the SCEERUN2 data set. Verify that the run-time library is installed properly.

The data set does not exist.

## **Explanation**

This message provides the cause of the failure in data definition name allocation. Message FSUM3421 provides the name of the data set.

#### **User response**

Make sure the data set is properly allocated.

#### **FSUM3419**

A Ddpi error has been encountered: number.

## **Explanation**

An error has occured while generating DWARF 3.0 debug information.

In the message text:

number is the error number generated by the libddpi APIs.

## **User response**

If you do not require debug information, reenter the as command without the -g option. Otherwise, provide the indicated error number to the IBM service representative responsible for your installation.

#### FSUM3420

An error has been encountered in string.

## **Explanation**

The indicated message text contains the phase where the error has occured. The known phases are:

- · ESI (extraction of symbol information)
- A2D (ADATA to DWARF conversion)
- POM (production of object map)

In the message text:

string is the phase where the error has occured.

## **User response**

This is an internal error. Provide the indicated error text to the IBM service representative responsible for your installation.

#### **FSUM3421**

An error has occurred when establishing the DD name for string1.string2

#### **Explanation**

An error has occured while the as command uses the SVC99 service to allocate the data definition name.

In the message text:

string1 is the file name. string2 is the SVC99 message.

#### **User response**

The cause of the error is indicated in the second part of the message. If the cause of the error is still unclear, reenter the as command with the --verbose option, and redirect the output to a file. Provide this information to the IBM service representative responsible for your installation.

An error has occurred when reading *string1*: errno: *number*, strerror: *string2*.

# **Explanation**

Unable to read from the indicated file.

In the message text:

string1 is the file being fread(). number is the errno set by fread(). string2 is the error messsage associated with errno.

## **User response**

This is an internal error. Reenter the as command with the --verbose option, and redirect the output to a file. Provide this information to the IBM service representative responsible for your installation.

**FSUM3423** 

An error has occurred when writing *string1*: errno: *number*, strerror: *string2*.

# **Explanation**

Unable to write to the indicated file.

In the message text:

string1 is the file being fwrite(). number is the errno set by fwrite(). string2 is the error messsage associated with errno.

## **User response**

This is an internal error. Reenter the as command with the --verbose option, and redirect the output to a file. Provide this information to the IBM service representative responsible for your installation.

**FSUM3424** 

An error has occurred: string.

# **Explanation**

This is a generic error message. Refer to the error message text for a description of the error.

In the message text:

string contains the cause of the error and the method of recovery.

#### User response

Refer to the error messsage text for information on how to recover from the error.

**FSUM3425** 

The file string does not exist.

## **Explanation**

The as command cannot find the indicated file.

In the message text:

string is a file name.

#### **User response**

Verify that the file name specified is correct and the proper permissions are set.

An incompatible DLL has been detected. 0xhexnum1 is the LIBDDPI\_DLL\_VERSION with which string was compiled. 0xhexnum2 is the LIBDDPI\_DLL\_VERSION of the DLL.

## **Explanation**

The Common Debug Architecture run-time version is outdated.

In the message text:

hexnum1 is the Common Debug Architecture run time that is compiled with the as command. string is one of the source file names in the as command. hexnum2 is the Common Debug Architecture run time that is being used to run the as command.

## **User response**

Contact the IBM service representative responsible for your installation and verify that you have the latest Common Debug Architecture run time installed.

**FSUM3427** 

An incompatible DLL has been detected. 0xhexnum1 is the LIBELF\_DLL\_VERSION with which string was compiled. 0xhexnum2 is the LIBELF\_DLL\_VERSION of the DLL.

## **Explanation**

The Common Debug Architecture run-time version is outdated.

In the message text:

hexnum1 is the Common Debug Architecture run time that is compiled with the as command. string is one of the source file names in the as command. hexnum2 is the Common Debug Architecture run time that is being used to run the as command.

#### **User response**

Contact the IBM service representative responsible for your installation and verify that you have the latest Common Debug Architecture run time installed.

**FSUM3428** 

The listing file name is too long. It must not be more than *number* characters.

#### **Explanation**

The specified listing file name is too long.

In the message text:

number is the maximum character length for the file name.

#### **User response**

Provide a listing file name with less than the indicated number of characters.

FSUM3429

The object file name is too long. It must not be more than *number* characters.

# **Explanation**

The specified object file name is too long.

In the message text:

*number* is the maximum character length for the file name.

#### **User response**

Provide an object file name with less than the indicated number of characters.

#### **FSUM3430**

The option string is specified with multiple source files.

## **Explanation**

The indicated option can only be specified when there is exactly one input source file.

In the message text:

string is an option name.

# **User response**

Specify only one source file when using this option.

**FSUM3431** 

**Options: string** 

## **Explanation**

The as command displays a list of options passed to the assemble step when the command line option --verbose is used.

In the message text:

string contains a list of option names.

## **User response**

Remove the command line option --verbose to suppress this message.

FSUM3432

Out of memory allocating *number* bytes for *string*.

#### **Explanation**

The as command ran out of memory trying to assemble the file. This sometimes happens with large input files.

In the message text:

*number* is the number of bytes as tries to allocate. *string* contains the name of the function trying to allocate the memory.

#### **User response**

Shut down any large processes that are running. You may need to specify the runtime option HEAP(,,,FREE,,) to prevent the as command from running out of memory.

**FSUM3433** 

Out of memory allocating *number* bytes.

#### **Explanation**

The as command ran out of memory trying to assemble the file. This sometimes happens with large input files.

In the message text:

number is the number of bytes as tries to allocate.

#### User response

Shut down any large processes that are running. You may need to specify the runtime option HEAP(,,,FREE,,) to prevent the as command from running out of memory.

SVC99 error code 0xhexnum1, info code 0xhexnum2.

## **Explanation**

This message provides the cause of the failure in data definition name allocation. Message FSUM3421 provides the name of the data set.

In the message text:

hexnum1 is the SVC99 error code. hexnum2 is the SVC99 information code.

## **User response**

Make sure the data set is properly allocated. If the error still persists, reenter the as command with the --verbose option, and redirect the output to a file. Provide this information to the IBM service representative responsible for your installation.

#### **FSUM3437**

Unable to allocate *string1* data set concatenation. The first data set in error is *string2*.

## **Explanation**

The as command is unable to process the indicated data set.

In the message text:

string1 is a list of concatenated dataset names. string2 is the data set that is not allocated.

## **User response**

Verify that the data set exists and is properly allocated.

#### **FSUM3438**

Unable to load the assembler compiler.

#### **Explanation**

The as command can not load the assembler compiler.

#### **User response**

Reenter the as command. If the problem persists, contact the IBM service representative responsible for your installation.

#### **FSUM3439**

Unable to obtain the file information for string.

## **Explanation**

The as command requires the input source file to be a sequential data set, a PDS member, a PDSE member or a UNIX System Services file.

In the message text:

string is the name of input source file.

#### User response

Reenter the as command and specify a valid file name.

#### **FSUM3440**

Unable to open the debug file string.

## **Explanation**

The indicated file can not be opened for writing.

#### **FSUM** messages

In the message text:

string is the name of the debug file.

#### **User response**

If a file with the same name already exists, give the existing file another name before you reenter the as command.

#### **FSUM3441**

Unable to open the listing file string.

## **Explanation**

The indicated file can not be opened for writing.

In the message text:

string is the name of the listing file.

## **User response**

If a file with the same name already exists, make sure it is renamed to another name before you reenter the as command.

#### **FSUM3442**

Unable to open the object file string.

## **Explanation**

The indicated file can not be opened for writing.

In the message text:

string is the name of the object file.

### **User response**

If a file with the same name already exists, make sure it is renamed to another name before you reenter the as command.

#### **FSUM3443**

Unable to open the source file string for read.

#### **Explanation**

The indicated file can not be opened for reading.

In the message text:

string is the name of the input source file.

#### **User response**

Make sure the source file exists and has the correct read permission.

#### **FSUM3444**

Unable to set up stderr for writing asm error messages.

## **Explanation**

The as command is unable to access files within /dev/ for writing.

## **User response**

This is an internal error. Reenter the as command with the --verbose option, and redirect the output to a file. Provide this information to the IBM service representative responsible for your installation.

An invalid option string is specified.

# **Explanation**

The indicated option is not a valid as option.

In the message text:

string is an invalid option.

## **User response**

Reenter the as command and specify a valid option.

**FSUM3495** 

The debug file name is too long. It must not be more than *number* characters.

## **Explanation**

The specified debug file name is too long.

In the message text:

number is the maximum character length for the file name.

## **User response**

Provide a debug file name with less than the indicated number of characters.

#### **FSUM3496**

Option string accepts a maximum of number suboptions.

# **Explanation**

The number of given suboptions exceeds the maximum allowed by the option.

In the message text:

string is the option name. number is the maximum number of suboptions allowed.

## **User response**

Use the correct number of suboptions for each option.

#### **FSUM3497**

Option string requires a minimum of number suboptions.

## **Explanation**

The number of given suboptions is less than the minimum required by the option.

In the message text:

string is the option name. *number* is the minimum number of suboptions required.

#### User response

Use the correct number of suboptions for each option.

#### **FSUM3498**

Option string cannot be specified in negative form.

#### **Explanation**

The specified option is only allowed in the positive form.

In the message text:

#### **FSUM** messages

string is the positive form of the option name.

#### **User response**

Ensure that a valid Assembler option is specified.

#### **FSUM3499**

The option string has invalid syntax.

# **Explanation**

There is no closing parenthesis for the suboptions of the specified option.

In the message text:

string is the option name.

# **User response**

Ensure that the suboptions are enclosed in parentheses.

FSUM4001

/etc/log created by /usr/sbin/init

# **Explanation**

/usr/sbin/init erased and recreated the /etc/log file during start of z/OS UNIX system services with the START OMVS command.

## **System action**

/usr/sbin/init continues.

# System programmer response

None.

#### **User response**

None.

FSUM4002

/etc/log created by /usr/sbin/init, <date/time>

# **Explanation**

/usr/sbin/init erased and recreated the /etc/log file at <date/time> during start of z/OS UNIX system services with the START OMVS command.

# **System action**

/usr/sbin/init continues.

#### System programmer response

None.

#### User response

None.

FSUM4003

Shell with pathname <name> unaccessible

/usr/sbin/init could not find a shell with pathname < name > in z/OS UNIX file system.

## System action

/usr/sbin/init exits with status 04 (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

### System programmer response

Verify that the shell pathname specified in the /etc/init.options file (default = /bin/sh) is in the z/OS UNIX file system.

### **User response**

Contact your system programmer.

#### **FSUM4004**

#### Script with pathname <name> unaccessible

### **Explanation**

/usr/sbin/init could not find an initialization script with pathname <name> in the z/OS UNIX file system.

## System action

/usr/sbin/init exits with status 05 (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

## System programmer response

Verify that the script pathname specified in the /etc/init.options file (default = /etc/rc) is in the z/OS UNIX file system.

#### **User response**

Contact your system programmer.

#### **FSUM4005**

#### Sigaction for SIGALRM handler failed

### **Explanation**

The sigaction() request by /usr/sbin/init to install the SIGALRM signal catcher failed.

## **System action**

/usr/sbin/init exits with status 07 (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

## System programmer response

Investigate why the sigaction() request failed.

#### User response

Contact your system programmer.

**FSUM4006** 

Execve <shell-pathname>, script = <script-pathname>, timeout = <time-interval> seconds

/usr/sbin/init issued an execve() request to invoke a shell with pathname <shell-pathname> to execute an initialization script with pathname <script-pathname>. /usr/sbin/init is set up to wait <time-interval> seconds for the shell to finish executing the initialization script.

## **System action**

/usr/sbin/init waits while the shell executes the initialization script.

#### **User response**

None.

**FSUM4007** 

Fork for <shell-pathname> process space failed

## **Explanation**

The fork() request by /usr/sbin/init to create a child process for the shell with pathname <shell-pathname> failed.

## **System action**

/usr/sbin/init exits with status 0E (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

### System programmer response

Investigate why the fork() request failed.

### **User response**

Contact your system programmer.

#### FSUM4008

Unable to unblock signals for <shell-pathname>

## **Explanation**

The sigprocmask() request by /usr/sbin/init to unblock signals before invoking the shell with pathname <shell-pathname> failed.

### System action

/usr/sbin/init exits with status 16 (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

#### System programmer response

Investigate why the sigprocmask() request failed.

### **User response**

Contact your system programmer.

#### **FSUM4009**

Execve of shell with pathname <pathname> failed

#### **Explanation**

The execve() request by /usr/sbin/init to invoke the shell with pathname < shell-pathname > failed.

/usr/sbin/init exits with status 17 (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

### System programmer response

Investigate why the execve() request failed.

#### User response

Contact your system programmer.

#### **FSUM4010**

#### Waitpid for <shell-pathname> failed

### **Explanation**

The waitpid() request by /usr/sbin/init to wait for the shell with pathname <shell-pathname> to finish executing the initialization script failed.

### **System action**

/usr/sbin/init sends SIGTERM to terminate the shell process group, which includes the shell process and any processes created by the shell to execute the initialization script. Then /usr/sbin/init exits with status OF (hexadecimal). The system continues.

### System programmer response

Investigate why the waitpid() request failed.

#### **User response**

Contact your system programmer.

#### FSUM4011

#### Waitpid for <shell-pathname> failed, <date/time>

### **Explanation**

The waitpid() request by /usr/sbin/init at <date/time> to wait for the shell with pathname <shell-pathname> to finish executing the initialization script failed.

## **System action**

/usr/sbin/init sends SIGTERM to terminate the shell process group, which includes the shell process and any processes created by the shell to execute the initialization script. Then /usr/sbin/init exits with status OF (hexadecimal). The system continues.

#### **System programmer response**

Investigate why the waitpid() request failed.

#### User response

Contact your system programmer.

FSUM4012

Timeout after <time-interval> seconds waiting for <shell-pathname>

/usr/sbin/init received a SIGALRM signal while waiting for the shell with pathname <shell-pathname> to finish executing the initialization script.

Before invoking the shell, /usr/sbin/init issues an alarm() request to generate the SIGALRM signal after <time-interval> seconds.

## **System action**

If the value of the terminate option, -t, specified in the /etc/init.options file is nonzero (default = 1), /usr/sbin/init sends SIGTERM to terminate the shell process group, which includes the shell process and any processes created by the shell to execute the initialization script. Then /usr/sbin/init exits with status 10 (hexadecimal). The system continues.

### System programmer response

Investigate if a longer time interval is required for /usr/sbin/init to wait for the shell to finish executing the initialization script. The time interval to wait is specified with the -a option in the /etc/init.options file (default = 10 seconds).

#### **User response**

Contact your system programmer.

**FSUM4013** 

Timeout, <date/time>, after <time-interval> seconds waiting for <shell-pathname>

## **Explanation**

/usr/sbin/init received a SIGALRM signal at <date/time> while waiting for the shell with pathname <shell-pathname> to finish executing the initialization script.

Before invoking the shell, /usr/sbin/init issues an alarm() request to generate the SIGALRM signal after <time-interval> seconds.

# **System action**

If the value of the terminate option, -t, specified in the /etc/init.options file is nonzero (default = 1), /usr/sbin/init sends SIGTERM to terminate the shell process group, which includes the shell process and any processes created by the shell to execute the initialization script. Then /usr/sbin/init exits with status 10 (hexadecimal). The system continues.

## System programmer response

Investigate if a longer time interval is required for /usr/sbin/init to wait for the shell to finish executing the initialization script. The time interval to wait is specified with the -a option in the /etc/init.options file (default = 10 seconds).

#### User response

Contact your system programmer.

**FSUM4014** 

<shell-pathname> exit with status <stat>

# **Explanation**

The waitpid() request issued by /usr/sbin/init to wait for the shell with pathname <shell-pathname> to execute the initialization script returned control to /usr/sbin/init because the shell exited with status <stat> (hexadecimal).

/usr/sbin/init notifies z/OS UNIX system services that the shell exited and then exits with status 0. The system continues.

## System programmer response

Investigate why the shell exited with nonzero status.

#### **User response**

If the status returned by the shell is nonzero, contact your system programmer.

**FSUM4015** 

<shell-pathname> exit with status <stat>, <date/time>

### **Explanation**

The waitpid() request issued by /usr/sbin/init to wait for the shell with pathname <shell-pathname> to execute the initialization script returned control to /usr/sbin/init at <date/time> because the shell exited with status <stat>.

### **System action**

/usr/sbin/init notifies z/OS UNIX system services that the shell exited and then exits with status 0. The system continues.

### System programmer response

Investigate why the shell exited with nonzero status.

## **User response**

If the status returned by the shell is nonzero, contact your system programmer.

FSUM4016

<shell-pathname> terminated by signal <sig>

#### **Explanation**

The waitpid() request issued by /usr/sbin/init to wait for the shell with pathname <shell-pathname> to execute the initialization script returned control to /usr/sbin/init because the shell was terminated by a signal with signal number <sig>.

## **System action**

/usr/sbin/init exits with status 11 (hexadecimal). The system continues.

#### System programmer response

Investigate why the shell received the terminating signal.

### **User response**

Contact your system programmer.

**FSUM4017** 

<shell-pathname> terminated by signal <sig>, <date/time>

The waitpid() request issued by /usr/sbin/init to wait for the shell with pathname <shell-pathname> to execute the initialization script returned control to /usr/sbin/init at <date/time> because the shell was terminated by a signal with signal number <sig>.

### **System action**

/usr/sbin/init exits with status 11 (hexadecimal). The system continues.

### System programmer response

Investigate why the shell received the terminating signal.

### **User response**

Contact your system programmer.

**FSUM4018** 

<shell-pathname> stopped by signal <sig>

### **Explanation**

The waitpid() request issued by /usr/sbin/init to wait for the shell with pathname <shell-pathname > to execute the initialization script returned control to /usr/sbin/init because the shell was stopped by a signal with signal number <sig>.

## **System action**

/usr/sbin/init sends SIGTERM to terminate the shell process group, which includes the shell process and any processes created by the shell to execute the initialization script. Then /usr/sbin/init exits with status 12 (hexadecimal). The system continues.

#### System programmer response

Investigate why the shell process received the stop signal.

#### **User response**

Contact your system programmer.

**FSUM4019** 

<shell-pathname> stopped by signal <sig>, <date/time>

### **Explanation**

The waitpid() request issued by /usr/sbin/init to wait for the shell with pathname <shell-pathname> to execute the initialization script returned control to /usr/sbin/init at <date/time> because the shell was stopped by a signal with signal number <sig> (hexadecimal).

# **System action**

/usr/sbin/init sends SIGTERM to terminate the shell process group, which includes the shell process and any processes created by the shell to execute the initialization script. Then /usr/sbin/init exits with status 12 (hexadecimal). The system continues.

#### System programmer response

Investigate why the shell process received the stop signal.

Contact your system programmer.

#### FSUM4020

#### Ready signal received

## **Explanation**

/usr/sbin/int received a SIGCONT signal from z/OS UNIX system services indicating that system services are now generally available to batch and interactive users. z/OS UNIX system services sends the SIGCONT signal in response to /usr/sbin/int's sending a SIGSTOP signal. /usr/sbin/int sends the SIGSTOP signal when the shell exits after executing the initialization script.

## **System action**

/usr/sbin/init exits with status 0. The system continues.

## System programmer response

None.

#### **User response**

None.

**FSUM4021** 

Ready signal received, <date/time>

### **Explanation**

/usr/sbin/int received a SIGCONT signal from z/OS UNIX system services at <date/time> indicating that system services are now generally available to batch and interactive users.

z/OS UNIX system services send the SIGCONT signal in response to /usr/sbin/int's sending a SIGSTOP signal. /usr/sbin/init sends the SIGSTOP signal when the shell exits after executing the initialization script.

### **System action**

/usr/sbin/init exits with status 0. The system continues.

### System programmer response

None.

#### **User response**

None.

**FSUM4022** 

#### ARG\_MAX exceeded parsing <option-value>

#### **Explanation**

While parsing an option with value *<option-value>* in the /etc/init.options file, /usr/sbin/init determined that additional bytes required for this value would cause the configurable system variable value, {ARG\_MAX}, to be exceeded.

./usr/sbin/init issues execve() to invoke a shell to execute the initialization script. The number of bytes required for the execve() parameters, which include shell and script pathnames and environment variables specified in the /etc/init.options file, cannot exceed the configurable system variable value, {ARG\_MAX}. /usr/sbin/int determines this value by issuing a sysconf(\_SC\_ARG\_MAX) request.

/usr/sbin/int exits with status 14 (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

## System programmer response

Investigate why the ARG\_MAX value was exceeded.

#### **User response**

Contact your system programmer.

**FSUM4023** 

ENV\_MAX exceeded parsing <env-option-value>

### **Explanation**

While parsing an environment variable option, -e, with value <env-option-value> in the /etc/init.options file, /usr/sbin/int determined that the number of environment variables specified in the /etc/init.options file exceeded 25.

### **System action**

/usr/sbin/int exits with status 15 (hexadecimal) without invoking a shell to execute the initialization script. The system continues.

### System programmer response

Investigate why the ENV\_MAX value, 25, was exceeded.

#### **User response**

Contact your system programmer.

FSUM4024

Unable to open options file, /etc/init.options

#### **Explanation**

/usr/sbin/init could not access the options file whose pathname is /etc/init.options.

### **System action**

/usr/sbin/init continues using default option values.

#### System programmer response

Determine if the options file is required to override defaults.

#### User response

If you expect /usr/sbin/init to use non-default option values, contact your system programmer.

**FSUM4025** 

<partial-option-value> option value too long

#### **Explanation**

While parsing an option with partial value *<partial-option-value>* in the /etc/init.options file, /usr/sbin/init determined that the entire value would exceed 255 bytes.

/usr/sbin/init continues using the default option value.

### System programmer response

Investigate why the maximum option value, 255 bytes, was exceeded.

#### **User response**

Contact your system programmer.

FSUM4026

Invalid timeout value = <time-interval>

### **Explanation**

The time interval value *<time-interval>* specified by the -a option in the /etc/init.options file is not valid. It must be a number of seconds less than 10,000. It specifies the number of seconds /usr/sbin/int will wait for the shell to execute the initialization script.

### **System action**

/usr/sbin/int continues using the default option value (180 seconds).

## System programmer response

Investigate why the -a option value is not a number of seconds less than 10,000.

### **User response**

Contact your system programmer.

**FSUM4027** 

Timeout option value = <time-interval>

#### **Explanation**

The time interval value <time-interval> specified by the -a option in the /etc/init.options file is valid. /usr/sbin/int will wait this number of seconds for the shell to execute the initialization script.

#### **System action**

/usr/sbin/init continues using the timeout option value specified.

### System programmer response

None.

#### **User response**

None.

**FSUM4028** 

Invalid terminate flag = <flag-value>

#### **Explanation**

The terminate flag value *<flag-value>* specified by the -t option in the /etc/init.options file is not valid. It must be a digit in the range 0 through 9. A nonzero value indicates that /usr/sbin/init should terminate the shell process group if /usr/sbin/int times out while waiting for the shell to execute the initialization script.

/usr/sbin/int continues using the default option value (1 = terminate).

### System programmer response

Investigate why the -t option value is not a digit in the range 0 through 9.

#### **User response**

Contact your system programmer.

FSUM4029

Terminate option flag = <flag-value>

### **Explanation**

The terminate flag value *<flag-value>* specified by the -t option in the /etc/init.options file is valid. A nonzero value indicates that /usr/sbin/init should terminate the shell process group if /usr/sbin/int times out while waiting for the shell to execute the initialization script.

### **System action**

/usr/sbin/int continues using the option value specified.

## System programmer response

None.

#### **User response**

None.

**FSUM4030** 

Invalid environment variable name: <ev-option-value>

### **Explanation**

An environment variable option value <ev-option-value> specified by a -e option in the /etc/init.options file is not valid. <ev-option-value> must have the form name=value. name, which specifies the name of an environment variable, must be delimited by leading blanks and a trailing equal sign (=). name cannot contain embedded blanks or equal signs.

## **System action**

/usr/sbin/init ignores the incorrect -e option and continues.

#### System programmer response

Investigate why the -e option value is not of form *name=value*.

#### **User response**

Contact your system programmer.

FSUM4031

Invalid environment variable value: <ev-option-value>

#### **Explanation**

An environment variable option value <ev-option-value> specified by a -e option in the /etc/init.options file is not valid. <ev-option-value> must have the form name=value. value, which specifies the value of an environment

variable, must be delimited by a leading equal sign (=) and trailing blanks. *value* cannot contain embedded blanks.

# **System action**

/usr/sbin/int ignores the incorrect -e option and continues.

### System programmer response

Investigate why the -e option value is not of form name=value.

### **User response**

Contact your system programmer.

FSUM4032

Environment variable option string: <name=value>

## **Explanation**

The environment variable string <name=value> specified by a -e option in the /etc/init.options file is valid. /usr/sbin/init issues a setenv() request to add (or replace) the environment variable with name name and value value to its environment variable array. After processing the /etc/init.options file, /usr/sbin/init uses execve() to invoke the shell and to pass it the environment variable array.

# **System action**

/usr/sbin/int continues.

## System programmer response

None.

#### **User response**

None.

FSUM4033

Invalid shell pathname = <pathname-option-value>

#### **Explanation**

The shell pathname *<pathname-option-value>* specified by the -sh option in the */etc/init.options* file is not a valid pathname.

## **System action**

/usr/sbin/int continues using the default option value (/bin/sh).

#### System programmer response

Investigate why the -sh option value is not valid.

#### **User response**

Contact your system programmer.

FSUM4034

Shell pathname option = <pathname-option-value>

The shell pathname value *<pathname-option-value>* specified by the -sh option in the */etc/init.options* file is valid. */usr/sbin/init* uses this pathname to invoke a shell to execute the initialization script.

### System action

/usr/sbin/int continues using the specified option value for the shell pathname.

#### System programmer response

None.

#### **User response**

None.

FSUM4035

Invalid script pathname = <pathname-option-value>

## **Explanation**

The script pathname *<pathname-option-value>* specified by the -sc option in the */etc/init.options* file is not a valid pathname.

## System action

/usr/sbin/int continues using the default option value (/etc/rc).

### System programmer response

Investigate why the -sc option value is not valid.

#### **User response**

Contact your system programmer.

**FSUM4036** 

Script pathname option = <pathname-option-value>

#### **Explanation**

The script pathname value *<pathname-option-value>* specified by the -sc option in the /etc/init.options file is valid. /usr/sbin/init passes this pathname to the shell as the pathname of the initialization script to be executed.

### **System action**

/usr/sbin/int continues using the specified option value for the script pathname.

#### System programmer response

None.

## **User response**

None.

**FSUM4037** 

No shell execution option

/usr/sbin/int found a shell pathname option, -sh, line in the /etc/init.options file in which the option value field consisted of all blanks followed by the value field continuation character, backslash (\). This -sh option value tells /usr/sbin/init to bypass invoking a shell to execute an initialization script and, instead, to raise SIGSTOP to signal z/OS UNIX system services that the system is ready for multiuser access.

## **System action**

When z/OS UNIX system services send a SIGCONT signal in response to the SIGSTOP signal, /usr/sbin/init exits with status 0. The system continues.

### System programmer response

None.

#### **User response**

None.

**FSUM4038** 

No value found for -<option-name> option

### **Explanation**

/usr/sbin/init found an option line in the /etc/init.options file for option *<option-name>*. However, no option value was specified for this option.

# **System action**

/usr/sbin/init ignores this option line and continues.

## System programmer response

Investigate why an option value was not specified.

#### User response

Contact your system programmer.

#### **FSUM4039**

Open of message catalog <catalog-name> failed

#### **Explanation**

/usr/sbin/init could not open the message catalog with name <catalog-name>.

#### **System action**

/usr/sbin/init continues using default message text for messages it writes into the /etc/log file.

### System programmer response

Investigate why the open failed.

#### User response

Contact your system programmer.

FSUM4040

Spawn2 /etc/inittab, timeout = <time-interval> seconds

/usr/sbin/init issued a spawn2() request to process the /etc/inittab file. /usr/sbin/init is set up to wait <time-interval> seconds for the /etc/inittab file to be processed.

### System action

/usr/sbin/init waits while the /etc/inittab file is processed.

#### **User response**

None.

FSUM5001

Usage: chaudit [-adFi] attr file ...

### **Explanation**

You specified incorrect arguments on the **chaudit** request.

## **User response**

Verify the syntax of the request and reenter the command.

FSUM5002

chaudit: Missing argument(s)

## **Explanation**

You specified an improper number of arguments on the **chaudit** request.

## **User response**

Verify the syntax of the request and reenter the command.

FSUM5003

chaudit: fatal error during "-F" or "-d" option

#### **Explanation**

An unexpected error occurred while the recursive **chaudit** request was processing.

## System programmer response

This error is caused primarily by a stat() failure. Check integrity of filesystem.

#### **User response**

Reenter the **chaudit** command. If the problem persists, contact your system administrator.

FSUM5004

chaudit: read directory "string" failed

# **Explanation**

You are not authorized to perform a read operation on the specified file or directory.

#### **User response**

Verify that the file or directory name is correct, verify the permissions to the file, and reenter the command.

**FSUM5005** 

chaudit: stat file "string" failed

You are not authorized to perform a stat operation on the specified file or directory.

## **User response**

Verify that the file or directory name is correct, verify the permissions to the file, and reenter the command.

FSUM5006

chaudit: Unknown or missing operator in symbolic attr "string"

### **Explanation**

You specified an incorrect attribute value on the **chaudit** request.

### User response

Verify the syntax of the request and reenter the command.

**FSUM5007** 

chaudit: Unable to open the message catalog

## **Explanation**

The message catalog cannot be opened. Processing continues with the default messages being used.

### System programmer response

Verify that the message catalog exists in the file system.

#### User response

Contact the system programmer.

FSUM5008

chaudit: Unable to close the message catalog

#### **Explanation**

The message catalog cannot be closed.

### System programmer response

Investigate why the catclose() function failed.

#### **User response**

Contact the system programmer.

**FSUM5009** 

chaudit: "string": Operation not permitted

#### **Explanation**

You are not authorized to change the file or directory.

#### **User response**

Verify that the file or directory is correct, verify the permissions to the file, and reenter the command.

**FSUM5010** 

chaudit: "string": No such file or directory

#### **FSUM** messages

## **Explanation**

The specified file or directory does not exist.

## **User response**

Verify that the file or directory is correct and reenter the command.

#### FSUM5011

su: User not authorized to obtain superuser authority.

## **Explanation**

The user ID issuing the **su** command does not have the proper authorization to switch to superuser.

### User response

Verify authorization with the system administrator.

FSUM5012

su: Unable to set up the user environment.

## **Explanation**

The environment variables required by the shell have not been set up.

## **System action**

The command ends.

### System programmer response

Determine why the setenv() function failed.

#### **User response**

Contact the system programmer.

FSUM5014

su: Unable to open the message catalog.

# **Explanation**

The message catalog cannot be opened. Processing continues with the default messages being used.

#### System programmer response

Verify that the message catalog exists in the file system.

#### **User response**

Contact the system programmer.

**FSUM5015** 

su: No password entered.

## **Explanation**

The password or password phrase of the specified user ID is required. Processing terminates.

#### **User response**

Enter the correct password or password phrase when prompted.

**FSUM5016** 

su: Password expired.

## **Explanation**

The password or password phrase of the specified user ID has expired. Processing terminates.

#### **User response**

Inform the owner of the specified userid that a new password or password phrase is required.

**FSUM5017** 

su: User not authorized to switch to "userid". Password incorrect.

### **Explanation**

The password or password phrase entered is not correct for the specified user ID.

### **User response**

Enter the correct password or password phrase when prompted.

**FSUM5018** 

su: Program loaded from an uncontrolled library.

### **Explanation**

When the BPX.DAEMON profile is defined in the FACILITY class, any program loaded in the address space where the su command is running must be defined to program control. Because an uncontrolled program has been loaded, the address space is marked "dirty".

## System action

The command ends.

### System programmer response

Check the system log for any messages from the security product indicating that the environment has become uncontrolled. (For example, ICH420I may be issued by RACF.) Define the programs or libraries to program control. Either use the RDEFINE command to define the program or library to the RACF PROGRAM class, or use the **extattr** +**p** shell command for a z/OS UNIX executable file. Verify that the /bin/su file has the p extended attribute and does not have the s extended attribute.

#### **User response**

Contact your system programmer.

FSUM5019

Enter the password for userid:

#### **Explanation**

The su command prompts you for the new user ID's password or password phrase.

## **User response**

Enter the password or password phrase of the specified user ID.

FSUM5020

su: User not authorized to switch to "userid".

## **Explanation**

The setuid to the specified user's UID failed because the user is not authorized.

## System programmer response

Determine why the setuid() function failed.

#### **User response**

Contact the system programmer.

FSUM5021

su: Unable to switch to "userid"

## **Explanation**

The setuid to the specified user's UID failed. Processing terminates.

### System programmer response

Take the appropriate action based on the error code. Verify that the RACF profile for the specified user ID contains an OMVS segment, and that the OMVS segment contains a UID.

#### **User response**

Check the error code explanation following this message. If unable to resolve, contact your system administrator.

FSUM5022

su: User ID "userid" is too long.

### **Explanation**

The specified user ID is not a valid user ID. Processing terminates.

#### User response

Specify a user ID that is defined.

**FSUM5023** 

su: User ID "*userid*" does not exist, or the RACF profile does not contain an OMVS segment.

#### **Explanation**

The specified user ID was either not defined to RACF or the RACF profile does not contain an OMVS segment. Processing terminates.

#### System programmer response

Verify that the RACF profile for the specified user ID contains an OMVS segment.

#### User response

Specify a valid user ID or contact the system administrator.

FSUM5024

su: Unable to get login name

#### **Explanation**

Failed to get the login name associated with the current process.

#### **System action**

Processing ends.

### System programmer response

Verify that the profile for the specified user ID contains an OMVS segment.

## **User response**

Check the error code explanation following this message. If invoked from outside the shell, ensure that you are using a user ID with an OMVS segment.

**FSUM5025** 

su: setuid: reason code = reason code

## **Explanation**

Failed to change the UID of the process.

# **System action**

Processing ends.

## System programmer response

Take the appropriate action based on the reason code.

### **User response**

Check the reason code explanation. Ensure that you are not running multiple processes in the same address space.

FSUM5026

su: setgid: reason code=reason code

## **Explanation**

Failed to change the GID of the process.

#### **System action**

Processing continues.

#### System programmer response

Take the appropriate action based on the reason code.

#### **User response**

Check the reason code explanation. Ensure that you are not running multiple processes in the same address space.

**FSUM5027** 

su: User is not a surrogate of "userid".

## **Explanation**

The user ID does not have read access to the SURROGAT class profile for the new user ID. Either a password or password phrase was not entered, or the -s option was used.

### **System action**

The command ends.

# System programmer response

Verify that the user ID has read access to the appropriate SURROGAT class profile.

#### **User response**

Contact the system administrator.

**FSUM5028** 

su: initgroups: reason code=reason code

## **Explanation**

Failed to change the supplementary groups of the process.

## System action

Processing continues.

## System programmer response

Take appropriate action based upon the reason code.

#### **User response**

Check the reason code explanation. Ensure that you are not running multiple processes in the same address space.

FSUM5029

su: getpwuid: Unable to get login profile for UID(0).

## **Explanation**

Failed to get a user profile associated with UID(0). This is needed for the su - command to switch to a login shell for the superuser.

### **System action**

The command ends.

## System programmer response

Check that a user ID is set up with UID(0).

#### **User response**

Contact the system administrator.

**FSUM5030** 

su: Out of memory

#### **Explanation**

su was unable to allocate memory needed.

#### **System action**

The command ends.

#### **User response**

Make more memory available.

FSUM5031

su: Unknown option -option

## **Explanation**

You specified an option that is not valid for the su command. If you specified login shell processing, the - must be separated from other arguments.

## **System action**

The command ends.

### **User response**

Check z/OS UNIX System Services Command Reference for a list of options.

**FSUM5032** 

su: getpwnam: Unable to get the OMVS segment of the RACF profile for "userid": error message

## **Explanation**

Failed to retrieve the OMVS segment of the RACF profile information for the user.

### System action

The command ends.

## **User response**

Check the error code explanation following this message.

**FSUM5033** 

su: Invalid password entered: reason code = reason code.

## **Explanation**

The password or password phrase entered is invalid.

#### System action

The command ends.

#### **User response**

Check the reason code explanation and take the appropriate action based on the reason code.

FSUM5101

gencat: Unable to open target file.

#### **Explanation**

The message catalog file specified as the target of gencat cannot be opened for output.

#### System programmer response

Determine why the fopen() function failed.

#### **User response**

Contact the system programmer.

**FSUM5102** 

gencat: Unable to allocate memory for the catalog.

#### **FSUM** messages

#### **Explanation**

gencat was unable to allocate needed memory.

## System programmer response

Determine why the malloc() function failed.

#### **User response**

Contact the system programmer.

FSUM5103

gencat: Message is longer than NL\_TEXTMAX value of number. string

## **Explanation**

This message is too long.

### **User response**

Make the message shorter.

**FSUM5104** 

gencat: Invalid set number. string

## **Explanation**

This set identifier is not a number within the values of 1 to NL\_SETMAX.

## **User response**

Change the set number.

FSUM5105

gencat: Message catalog generated normally.

#### **Explanation**

gencat has completed successfully.

FSUM5106

gencat: Cannot open gencat's message catalog. Processing continues normally.

#### **Explanation**

The message catalog for gencat's messages cannot be opened.

#### **System action**

Processing continues with the default messages being used.

## **System programmer response**

Verify that the message catalog exists in the file system.

#### **User response**

Contact the system programmer.

**FSUM5107** 

gencat: Unexpected newline within quotes. string

The message line ended without an ending quote or continuation character.

## **User response**

Correct the message source file.

FSUM5108

gencat: Invalid message number. string

### **Explanation**

This message identifier is not a number within the values of 1 to NL\_MSGMAX.

#### User response

Change the message number.

FSUM5109

gencat: Unexpected end of string, no newline or end of quotes. string

## **Explanation**

The message line ended with a null terminator, but no newline was found.

#### **User response**

Correct the message source file.

**FSUM5110** 

gencat: Error writing catalog header.

## **Explanation**

The file pointer consistency check in **gencat** discovered that an error occurred while writing the header of the message catalog to the target file.

## System programmer response

Contact IBM service.

#### **User response**

Contact the system programmer.

FSUM5111

gencat: Error writing catalog text.

#### **Explanation**

The file pointer consistency check in **gencat** discovered that an error occurred while writing the text of the message catalog to the target file.

## System programmer response

Contact IBM service.

#### **User response**

Contact the system programmer.

**FSUM5112** 

gencat: Unable to load catalog string

gencat was unable to load the target catalog because it was either not found, or is not a valid message catalog.

#### **User response**

Verify that the name is correct and that this file is a valid message catalog created with the **gencat** command.

FSUM5113

gencat: Unable to read existing catalog file string

## **Explanation**

gencat could not read the existing message catalog file.

## System programmer response

Determine why the fread() function failed.

#### **User response**

Contact the system programmer.

**FSUM5115** 

gencat: No messages defined in source file.

### **Explanation**

After processing all the source files, there were no messages to be written to the target catalog.

#### User response

Correct the input file.

**FSUM5116** 

gencat: The message/set numbers became out of order just after set number, msg number string

#### **Explanation**

All the set numbers and message numbers must be in ascending order in the message file.

#### **User response**

Correct the input file.

**FSUM5119** 

gencat: Unable to open source file string

#### **Explanation**

The message source file specified as the source for gencat cannot be opened for input.

## **System programmer response**

Determine why the fopen() function failed.

#### **User response**

Contact the system programmer.

FSUM5131

mkcatdefs: Specified MsgFile name is too long

The message file name specified as the first parameter to **mkcatdefs** is longer than the maximum allowed name.

#### **User response**

Correct the name.

FSUM5132 mkcatdefs: Cannot open string

## **Explanation**

Either mkcatdefs cannot open the header file for output, or cannot open one of the source files for input.

#### **System programmer response**

Determine why the fopen() function failed.

### **User response**

Contact the system programmer.

FSUM5133 mkcatdefs: There were write errors on file string

## **Explanation**

mkcatdefs found errors while writing to the file.

### System programmer response

Determine why the fprintf() function failed.

#### **User response**

Contact the system programmer.

FSUM5134 mkcatdefs: Error(s) found: no string created

## **Explanation**

mkcatdefs encountered one or more errors while processing the source files. No output is produced.

#### **System programmer response**

Determine why the functions failed.

#### User response

Contact the system programmer.

FSUM5135 mkcatdefs: string created

### **Explanation**

mkcatdefs successfully created this output file.

FSUM5136 mkcatdefs: No symbolic identifiers; no string created

There were no symbolic names specified in the source files. No header is produced.

**FSUM5137** 

mkcatdefs: Invalid set identifier found string

### **Explanation**

A set identifier is invalid for one of these reasons:

- A symbolic name contains invalid characters
- A numeric name is out of the range of values allowed for sets.

#### **User response**

Correct the identifier for this set.

**FSUM5138** 

mkcatdefs: Set is already assigned or sets not in ascending sequence string

### **Explanation**

You used numeric set identifiers that caused the set numbers to get out of ascending order.

#### **User response**

Correct the set identifier.

**FSUM5139** 

mkcatdefs: Symbolic name used more than once. string

## **Explanation**

You used the same symbolic name before to refer to this set or message. All symbolic names must be unique.

#### User response

Use a different symbolic name.

**FSUM5140** 

mkcatdefs: Invalid message identifier found string

#### **Explanation**

A message identifier is invalid for one of these reasons:

- A symbolic name contains invalid characters
- A numeric name is out of the range of values allowed for messages

#### User response

Correct the identifier for this message

**FSUM5141** 

mkcatdefs: Message number is already assigned or message numbers not in ascending sequence *string* 

#### **Explanation**

You used numeric message identifiers that caused the message numbers to get out of ascending order.

#### **User response**

Correct the message identifier.

480 z/OS: z/OS UNIX System Services Messages and Codes

**FSUM5142** 

mkcatdefs: Unexpected EOF, a continued message was not finished.

### **Explanation**

Message text ended with the continuation character (\), but this was the last line of the source file.

#### **User response**

Correct this message.

FSUM5151

dspmsg: catopen failed

### **Explanation**

The message catalog for this message cannot be opened. A message follows this one which explains the failure.

### System programmer response

Determine why the catopen() function failed.

## **User response**

Contact the system programmer.

**FSUM5152** 

dspmsg: catgets failed

#### **Explanation**

This message cannot be read from the message catalog. A message follows this one which explains the failure.

## System programmer response

Determine why the catgets() function failed.

#### **User response**

Contact the system programmer.

FSUM5153

dspmsg: too many arguments number, only 10 allowed.

### **Explanation**

More than ten arguments were passed to be included as variables in the message.

#### User response

Pass ten or less arguments.

**FSUM5154** 

dspmsg: too few arguments specified. Message requires *number1* arguments, but *number2* were passed.

#### **Explanation**

The message text contains format specifiers for more variables than were passed. This causes printf to program check.

#### User response

Pass the exact number of variables needed for this message.

#### FSUM5161

dspcat: No message id allowed with -g option.

### **Explanation**

You cannot specify a message number along with the -g option.

#### **User response**

Remove the -g option or the message number.

FSUM5162

dspcat: Unable to open this catalog

## **Explanation**

This message catalog cannot be opened. A message follows this one which explains the failure.

## System programmer response

Determine why the catopen() function failed.

## **User response**

Contact the system programmer.

**FSUM5164** 

dspcat: Unable to get this message.

### **Explanation**

This message cannot be read from the message catalog. A message follows this one which explains the failure.

### System programmer response

Determine why the catgets() function failed.

#### **User response**

Contact the system programmer.

**FSUM5165** 

dspcat: Unable to get this set.

### **Explanation**

This set cannot be read from the message catalog. A message follows this one which explains the failure.

#### **System programmer response**

Determine why the catgets() function failed.

### **User response**

Contact the system programmer.

FSUM5171

No \$set in string

#### **Explanation**

The source file to the **mkcatdefs** command does not contain any \$set directives. This is not a valid source file.

Correct the source file. See the **mkcatdefs** command for more information.

**FSUM5172** 

Can't open string

#### **Explanation**

The source file to the **mkcatdefs** command cannot be opened.

### **User response**

Specify a source file that exists.

FSUM5211

User not authorized to issue chroot.

## **Explanation**

The user ID issuing the **chroot** does not have the proper authorization. You must either be superuser or be a member of BPX.SUPERUSER facility class.

#### **User response**

Verify your authorization with the system administrator.

FSUM5212

**Usage: chroot directory command** 

### **Explanation**

You specified the **chroot** command incorrectly. **chroot** always needs the directory which specifies the new root directory and command which specifies a command to run with the **chroot** command.

#### **User response**

Re-enter the command using the correct syntax.

FSUM5213

chroot seteuid failed: reason code = reason code

#### **Explanation**

Failed to change to UID(0). Processing ends.

#### **User response**

Check the reason code explanation and any message that might follow the reason code. Ensure that you are not running multiple processes in the same address space.

**FSUM5214** 

chroot cannot change root

#### **Explanation**

**chroot** failed due to the displayed error.

## **User response**

Check the given return code for more information for the error.

FSUM5215

Unable to execute the shell

#### **FSUM** messages

#### **Explanation**

If the SHELL environment variable is set, chroot uses its value to invoke the shell.

#### **User response**

Verify that the shell exists.

FSUM5231

Error obtaining the user login name.

### **Explanation**

The \_getlogin1() function could not obtain the login name for the current terminal.

## **User response**

If the problem persists, contact your system administrator.

**FSUM5240** 

Usage: sysvar variable

## **Explanation**

You specified the sysvar command incorrectly, sysvar needs to know the variable for which it must retrieve.

## **User response**

Reenter the command using the correct syntax.

**FSUM5241** 

sysvar: variable is not defined as a system variable

## **Explanation**

sysvar cannot retrieve any information on the requested variable.

### System programmer response

Make sure the variable was defined when the system was IPLed.

#### **User response**

Make sure the variable was typed correctly.

**FSUM5242** 

**Unexpected ASASYMBM error.** rc=return code

#### **Explanation**

An unexpected return code was returned from the ASASYMBM assembler function.

#### **User response**

None.

**FSUM5243** 

fetch() failed for ASASYMBM service — processing terminates

## **Explanation**

ASASYMBM could not be loaded.

None.

FSUM5272

No password entered.

### **Explanation**

A null value was entered at the password prompt. Processing terminates and the password is not changed.

## **User response**

Reissue the command specifying the password or password phrase when prompted.

FSUM6001

Unknown option "-option"

### **Explanation**

You specified an option that is not valid for this command.

## **User response**

Check the command description in z/OS UNIX System Services Command Reference for a list of options.

**FSUM6003** 

input file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6004

write error on standard output

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6007

insufficient memory for string storage

## **Explanation**

There were not enough free system resources to use for string storage.

#### **User response**

Free up more system resources, or modify your program to require less string storage.

**FSUM6008** 

unbalanced char

## **Explanation**

An unbalanced number of parentheses or braces was encountered.

#### **User response**

Make sure that all braces and parentheses are paired.

**FSUM6013** 

Missing script file

### **Explanation**

You specified the -f option without providing the name of a script file.

#### **FSUM6014**

#### not enough available file descriptors

### **Explanation**

There were less than four available file descriptors.

## **User response**

Free up more file descriptors.

#### **FSUM6017**

#### Newline in regular expression

# **Explanation**

A newline was encountered while reading a regular expression.

## **User response**

Check for a missing / delimiter.

## FSUM6018

**Newline in string** 

## **Explanation**

A newline was encountered while reading a string constant.

#### **User response**

Check for a missing " delimiter.

#### FSUM6019

**EOF** in regular expression

#### **Explanation**

The end-of-file character was encountered while reading a regular expression.

## **User response**

Check for a missing / delimiter.

#### FSUM6020

**EOF** in string

#### **Explanation**

The end-of-file character was encountered while reading a string constant.

#### **User response**

Check for a missing " delimiter.

## FSUM6022

inadmissible use of reserved keyword

### **Explanation**

You attempted to use a reserved keyword in an unacceptable way (for example, as a function or variable name).

#### **User response**

Choose a different name for your function or variable.

#### FSUM6023

attempt to redefine builtin function

486 z/OS: z/OS UNIX System Services Messages and Codes

You attempted to redefine one of the built-in awk functions.

#### **User response**

Choose a name for your function that is not the name of any built-in function. For lists of built-in arithmetic and string functions, see <a href="mailto:awk - Process programs written">awk - Process programs written in the awk language</a> in z/OS UNIX System Services Command Reference.

FSUM6039

command: not found

### **Explanation**

You specified a *command-name* that the shell was unable to find.

#### **User response**

Make sure that command-name is spelled properly and that you have the appropriate permissions.

**FSUM6047** 

unredirected getline in END action

#### **Explanation**

The default output stream has already been closed when the END action is performed, so a getline function must be redirected or it fails.

## **User response**

Redirect the getline function to read from a named file.

FSUM6048

too many open streams to funcname onto "filename"

### **Explanation**

awk can only have a limited number of files open at one time. There were too many open files.

#### **User response**

Make sure that unused files are being closed properly, or restructure your program to have fewer files open at the same time.

**FSUM6049** 

insufficient arguments to printf or sprintf

#### **Explanation**

You did not specify enough arguments to match the number required by the specified format string.

#### **User response**

Check your format string and number of arguments.

**FSUM6052** 

Too many fields (LIMIT: number

## **Explanation**

awk read a record with more fields than it was able to handle.

Edit the input file to decrease the number of fields in the record.

FSUM6053

Record too long (LIMIT: number bytes)

### **Explanation**

awk read a record that was longer than the maximum record size it can handle. On UNIX and POSIX-compliant systems, the maximum record length is 20000 characters.

## **User response**

Edit the record so that it does not exceed the limit.

**FSUM6054** 

division (/ or %) by zero

## **Explanation**

An arithmetic operation using / or % resulted in an attempt to divide by zero.

### **User response**

Modify your program so that division by zero does not occur.

FSUM6055

too deeply nested for in loop (LIMIT: number)

### **Explanation**

"For" loops can only be nested *number* levels deep.

#### **User response**

Rewrite the program to use fewer levels of nesting.

**FSUM6058** 

lvalue required in assignment

#### **Explanation**

You did not specify a variable or array element as the left-hand side of an assignment expression.

#### User response

Specify a valid variable or array element on the left-hand side of the assignment operator.

FSUM6059

return outside of a function

## **Explanation**

A return statement was encountered that was not part of a function.

#### User response

Only use the return statement inside a function definition.

**FSUM6060** 

may delete only array element or array

## **Explanation**

You attempted to use the delete statement to delete a scalar variable.

Only use delete to delete arrays and array element.

#### FSUM6063

#### SYMTAB must have exactly one index

#### **Explanation**

You tried to reference the SYMTAB array using more than one index.

### **User response**

Always reference SYMTAB with exactly one index.

FSUM6069

regular expression error

# **Explanation**

An error occurred while processing a regular expression.

## **User response**

Check the regular expression.

**FSUM6070** 

second parameter to "split" must be an array

#### **Explanation**

You invoked the split function but the second parameter was not an array.

### **User response**

Invoke split with an array as the second parameter.

FSUM6074

Unknown FP error

### **Explanation**

An unknown error occurred during a floating-point operation.

#### User response

Contact your system programmer.

**FSUM6075** 

Domain

#### **Explanation**

A domain error occurred when executing a floating-point operation. For example, taking the square root of a negative number would cause this error.

#### **User response**

Make sure that you are performing a valid mathematical operation.

FSUM6076

Singularity

#### **Explanation**

The program executed a floating-point division that resulted in an infinite value.

Make sure that you are performing mathematical operations that produce finite results.

**FSUM6077** 

Overflow

### **Explanation**

The program executed an operation that resulted in a number that is larger than awk can represent on this platform.

## **User response**

Correct the program to use values that are supported on this system or bc.

**FSUM6078** 

Underflow

## **Explanation**

The program executed an operation that resulted in a number that is smaller than awk can represent on this platform.

#### **User response**

Correct the program to use values that are supported on this system or bc.

**FSUM6079** 

**Total loss of precision** 

## **Explanation**

The program executed a floating-point operation that used in an intermediate result that cannot be properly generated on this platform.

#### **User response**

Correct the program or use bc.

**FSUM6080** 

Partial loss of precision

#### **Explanation**

The program executed a floating-point operation that used in an intermediate result that cannot be properly generated on this platform.

FSUM6081

error in function funcname(arg) at NR=num records

## **Explanation**

A math error occurred while performing the function funcname on argument arg.

#### **User response**

Make sure that you are passing a proper argument to the function *funcname*.

FSUM6082

Missing fill character

# **Explanation**

You specified the -c option but did not provide a character following it.

Provide a fill character with the -c option.

**FSUM6083** 

Missing font file

## **Explanation**

You specified the -f option but did not provide the name of a font file following it.

## **User response**

Provide a font file with the -f option.

FSUM6084

Missing width after -w

## **Explanation**

You specified the -w option without providing the width argument.

# **User response**

Provide the missing width.

**FSUM6085** 

cannot open font file "fontfile"

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6086** 

banner: bad HALO font file format in "fontfile"

#### **Explanation**

You specified an invalid font file.

# **User response**

Use one of the files listed in the FILES section of the banner man page.

**FSUM6089** 

break statement found outside of loop

#### **Explanation**

bc encountered a break statement when it was not performing a "for" or "while" loop.

#### **User response**

Make sure that all "break" statements occur within for or while loops.

**FSUM6090** 

warning: body of if/else statement is empty

# **Explanation**

You did not supply any statements for the body of an if or if/else construct. **bc** only generates this message when you have specified -i option.

#### **User response**

Make sure that this is what you intended. **bc** man page **bc** syntax.

FSUM6091	bc: error on line line_num of filename
FSUM6092	empty stack (too few arguments ?)

An error occurred while executing a function, probably because the function was called with fewer arguments than required.

## **User response**

Make sure that you call functions with the correct number of arguments.

**FSUM6095** 

valid array index is 0 through num

# **Explanation**

You specified an array index that was not in the range 0 to BC\_DIM\_MAX-1, where BC\_DIM\_MAX is a configuration variable indicating the maximum number of elements that a **bc** array may have.

## **User response**

Specify an array index in the indicated range.

**FSUM6099** 

shell command failed to execute

# **Explanation**

You specified the sh statement with command as its argument and **bc** failed to run command.

# **User response**

Check the syntax of the specified command.

FSUM6101

end of file in comment starting on line num of filename

## **Explanation**

**bc** encountered the end-of-file character when reading a comment which begins on line *num* of the file *filename*.

#### **User response**

Make sure that the file filename contains a /\* to end each comment begun with a \*/.

FSUM6102

end of file in string starting on line num of filename

## **Explanation**

**bc** encountered the end-of-file character when reading a string that begins on line *num* of the file *filename*.

#### **User response**

Make sure that the file *filename* contains a double quote (") at the end of the string.

**FSUM6103** 

warning: '=-' operator assumed

#### **Explanation**

This version of **bc** permits the use of the old style assignment operators like = rather than - This can be ambiguous since a=-2 can mean a=-2 or a=-2. bc has assumed that you meant to use the =- operator.

Use spaces to clarify the syntax of the expression.

#### **FSUM6104**

#### numerical constant is too long

## **Explanation**

You specified a numerical constant that was longer than the maximum permitted length, as defined by the value of the configuration variable BC\_STRING\_MAX.

# **User response**

Specify a shorter numerical constant.

**FSUM6105** 

string is too long

# **Explanation**

You specified a string that was longer than the maximum permitted length, as defined by the value of the configuration variable BC\_STRING\_MAX.

#### **User response**

Specify a shorter string.

**FSUM6107** 

Unknown option "-option"

## **Explanation**

You specified an option that is not valid for this command.

## **User response**

For a list of options, check the command description in z/OS UNIX System Services Command Reference.

**FSUM6108** 

bc: execution error on line line of file

## **Explanation**

This message is a generic syntax error message. Refer to the given line number and file; the error may be there or a few lines back.

## **System action**

The program continues.

#### **User response**

For a list of options, check the command description in z/OS UNIX System Services Command Reference.

**FSUM6112** 

command too long

#### **Explanation**

You specified a command line to pass to the system with the! operator that was longer than 1000 bytes.

## User response

Use a shorter command line.

FSUM6113

input radix too big.

## **User response**

Specify a smaller input radix.

**FSUM6114** 

save: args

# **Explanation**

You attempted to use the s or S operator when there was no value on the stack.

## **User response**

Make sure that there is at least one value on the stack before trying to use the s and S commands.

**FSUM6115** 

output radix too big.

# **Explanation**

output radix too big for **dc** to handle.

## **User response**

Specify a smaller output radix.

FSUM6116

scale too big.

## **Explanation**

scale too big for dc to handle.

#### **User response**

Specify a smaller scaling factor.

FSUM6117

number expected, string found

## **Explanation**

dc expected a number but a string value was found.

#### **User response**

Make sure that the stack contains the proper type of value when performing operations using the stack.

**FSUM6118** 

negative argument to Q

#### **Explanation**

You attempted to use the Q operator but the value on the top of the stack was negative. Q cannot take a negative argument.

#### **User response**

Make sure that the stack has a positive number on top when using the Q operator.

FSUM6119

readstk?

You attempted to pop too many values off the stack with the Q operator.

## **User response**

Make sure that the top value on the stack is not greater than the number of currently executing strings.

FSUM6120

L?

## **Explanation**

You tried to pop a value off an empty stack variable using the L operator.

# **User response**

Correct your program.

FSUM6121

Q?

## **Explanation**

You specified a string argument to the **Q** command. This is invalid. The **Q** command requires a numeric argument.

# **User response**

Correct your program.

FSUM6122

negative index

# **Explanation**

You attempted to use a negative number as an array index.

## **User response**

Use a positive number as an array index.

FSUM6123

index too big

#### **Explanation**

You attempted to use an array index that was greater than 2047.

#### **User response**

Use an array index that is less than or equal to 2047.

FSUM6124

cannot execute number

# **Explanation**

You attempted to use the x operator to execute a string, but the value on the top of the stack was a number.

#### **User response**

Only use the x operator when there is a string on top of the stack.

FSUM6125

divide by 0

#### **Explanation**

You attempted to divide a number by 0.

#### **User response**

Do not divide numbers by 0.

#### **FSUM6126**

exponent must be an integer from 0 to max

## **Explanation**

You specified an exponent that was not an integer in the range 0 to SHRT\_MAX-1.

#### User response

Specify an exponent in the valid range.

#### FSUM6129

octalnum is unimplemented

# **Explanation**

You specified a character that is not a currently implemented operator. *oct\_num* is the octal value of the character.

#### **User response**

For a list of valid operators, see the description of dc in z/OS UNIX System Services Command Reference.

#### FSUM6130

sqrt of negative number

# **Explanation**

You attempted to take the square root of a negative number. The sqrt function must be used with positive numbers.

#### **User response**

Only use the sqrt function with positive numbers.

#### FSUM6131

stack too deep

## **Explanation**

You attempted to put more values on the stack than it was able to hold. The maximum size of the stack is limited by the size of the maximum integer your system can represent.

#### **User response**

Check for uncontrolled recursion.

#### **FSUM6132**

empty stack

# **Explanation**

You attempted an operation that required popping a value from the stack, but the stack was empty.

## User response

Push a value onto the stack and try the operation again.

496 z/OS: z/OS UNIX System Services Messages and Codes

**FSUM6133** 

out of memory

# **Explanation**

There were not enough free system resources to allocate the required space.

#### **User response**

Free up more resources and try again.

**FSUM6134** 

out of memory (fatal)

## **Explanation**

bc ran out of system resources but was unable to recover sufficient storage to continue.

# **User response**

Free up more resources and try again. Pay particular attention to large arrays.

**FSUM6155** 

insufficient memory

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6178** 

cat: input file "filename" is identical with output

## **Explanation**

You specified *filename* as both an input and output file. It is also possible that the output file was linked to *filename*.

#### **User response**

Use a file other than *filename* as the output file.

FSUM6180

file "filename"

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6181

command: fatal error during "-R" option

#### **Explanation**

You specified the -R option but some file or directory in the directory structure was inaccessible.

#### **User response**

Make sure that you have access to all files in the directory structure.

**FSUM6184** 

command: file "filename": You are not a member of the groupname group

# **Explanation**

You attempted to change the group ownership of *filename* to *group*, but you are not a member of the specified group.

#### **User response**

Specify a group to which you belong.

FSUM6185

command: group "groupname" is unknown

## **Explanation**

You specified a group name that could not be found in the group database.

# **User response**

Specify a valid group name or use a valid numeric group ID.

**FSUM6187** 

Missing mode argument.

## **Explanation**

You did not specify an argument representing the new access permissions.

# **User response**

Provide the missing argument.

**FSUM6188** 

stat file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6189

read directory "pathname"

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6191

command: user "username" is unknown

# **Explanation**

You specified a user name that could not be found in the user database.

#### **User response**

Specify a valid user name or use a valid numeric user ID.

FSUM6196

command: not executable

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6199

[read error]

#### **Explanation**

An error occurred while attempting to read the indicated file.

FSUM6202

Unknown terminal "term".

A path could not be determined for the terminal name, or none of standard input, standard output, and standard error were a terminal.

#### **User response**

Make sure that standard input is a terminal, not a redirected file or a pipe.

FSUM6203

No terminfo database.

# **Explanation**

The terminfo database could not be found.

# **User response**

Assign the environment variable TERMINFO to point at a valid database of terminal information.

FSUM6210

cannot determine PATH\_MAX

## **Explanation**

A system error indicating the cause is displayed with this message.

#### **User response**

Free up more system resources.

FSUM6213

cannot determine NAME\_MAX

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6214

cannot allocate buffer

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6216** 

Bits must be between num1 and num2

# **Explanation**

You specified a value for the maximum number of bits of compression with the -b option that fell outside of the range num1 to num2.

#### **User response**

Specify a value that falls in the *num1* to *num2* range.

FSUM6217

exec "uncompress"

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6219

output file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6220** 

tempfile

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6221** 

command: (-D) same count exceeded - aborting

## **Explanation**

compress encountered a line where more than the first 255 characters were identical to those of the previous line.

FSUM6229

command: filename has number other links: unchanged

# **Explanation**

You specified an input file that has more than one link.

## **User response**

Remove the additional links and try again.

**FSUM6232** 

command: unable to create tempfile name

#### **Explanation**

A temporary file could not be created in the directory named by /tmp directory, or the current directory.

#### **User response**

Make sure that you have appropriate permissions to create a temporary file in one of these three directories.

**FSUM6233** 

command: tempfile pathname too long

# **Explanation**

uncompress create a tempfile based on the name of the file to be uncompressed. The name of this file can only be PATHMAX charaters long.

#### User response

Move the compressed file closer to the root of the directory hierarchy before decompressing that file. This creates a shorter path name.

**FSUM6234** 

command: can't stat file

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6235** 

command: filename not a regular file: unchanged

# **Explanation**

You specified a file that was not a regular file. You cannot compress or uncompress directories, FIFOs, or other such files.

500 z/OS: z/OS UNIX System Services Messages and Codes

Make sure that the specified *filename* is a regular file.

**FSUM6237** 

no space on device for file "filename"

## **Explanation**

You attempted to copy (or move) a file to filename on a device that has no space for it.

# **User response**

Free up space on the target device or copy (or move) the file to another device.

**FSUM6238** 

cannot unlink source file "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6239** 

cannot unlink target file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6241** 

Unknown option "-option"

## **Explanation**

You specified an option that is not valid for this command.

#### **User response**

Check z/OS UNIX System Services Command Reference for a list of options.

FSUM6242

target "pathname" must be a directory

#### **Explanation**

You attempted to copy (or move) two or more files but the target indicated by name was not a directory.

#### **User response**

When copying (or moving) two or more files, ensure that the final name on the command line is a directory.

**FSUM6243** 

cannot allocate target string

#### **Explanation**

There are not enough free system resources to hold the name of the target file.

## **User response**

Free up more system resources.

**FSUM6244** 

cannot rename "file1" to "file2"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6245** 

link to target "filename" failed

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6246** 

cannot rmdir "pathname"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6247** 

stat error for "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6248** 

unreadable directory "pathname"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6249** 

recursive copy to directory "pathname"

## **Explanation**

You tried to recursively copy a directory to itself.

# **User response**

Choose a different pathname.

FSUM6250

target "pathname" is not a directory

#### **Explanation**

When recursively copying (or moving) multiple files using the -r or -R option, the target must be a directory. You specified a target pathname that is not a directory.

## **User response**

Check spelling of target pathname.

**FSUM6251** 

cannot mkdir "pathname"

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6254

"pathname" is a directory (not copied)

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6255** 

fifo "filename"

A system error indicating the cause is displayed with this message.

**FSUM6256** 

special file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6257** 

cannot allocate I/O buffer

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6258** 

cannot open file "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6259** 

target file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6260

write error on file "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6261

read error on file "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6263

command: must run as setuid root

# **Explanation**

This utility requires its binary file to be setuid root.

#### **User response**

Use the chmod command to do this or contact your system programmer to run this command.

FSUM6310

Can't find user: "user"

# **Explanation**

Can't find crontab or at job's MVS identity in the user database. Typically, this indicates that the user database was modified while cron was running.

#### **User response**

Recreate the crontab or at file, or contact the system programmer to restart cron.

FSUM6311

Can't stat "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6312 Can't find user: "userid"

## **Explanation**

Can't find crontab file's owner in the user database. Typically, this indicates that the user database was modified while cron was running.

# **User response**

Recreate the crontab file, or contact the system programmer to restart cron.

FSUM6313 bad queue: queue

# **Explanation**

A job has been submitted to an invalid queue. (Valid queues are typically the same as the character set on the host machine.)

#### **User response**

Resubmit the job to a valid queue.

FSUM6314

allocating queue entries

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6316 forking process

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6317 unknown process terminated: process\_id

#### **Explanation**

cron was notified of a terminating process which it did not create. (This indicates a POSIX.1 or POSIX.2 logic error.)

#### User response

Contact your system programmer. Follow local procedures for reporting a problem to IBM.

FSUM6318 temporary output file

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6319 temporary file

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6322 couldn't find user

**504** z/OS: z/OS UNIX System Services Messages and Codes

cron was unable to find a user ID in the user database. Typically, this indicates that the user database was modified while cron was running.

#### **User response**

Contact your system programmer.

**FSUM6323** 

notification process

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6324** 

couldn't find user in password file

# **Explanation**

cron could not find the user in the user database to print a log message. Typically, this indicates that the user database was modified while cron was running.

FSUM6325

cron: can't open log file!

#### **Explanation**

cron was unable to open its log file. Permissions on the log file or its directory might be incorrect.

## **User response**

Have your system programmer correct the permissions on the log file or its directory.

FSUM6342

write error

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6349** 

cannot create temporary file

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6352

Badly formed line offset in "offset"

# **Explanation**

You specified an offset that was not a valid integer.

#### User response

Specify a valid integer for offset.

FSUM6353

error in regular expression regexp regular\_expression\_error

### **Explanation**

You have entered a regular expression incorrectly. For more information about regular expressions, see <u>Regular</u> expressions (regexp) in *z/OS UNIX System Services Command Reference*.

**FSUM6354** 

Misplaced {number} repetition count

You specified a { number } repetition count before specifying the splitting criteria, or you specified the count without specifying any criteria at all.

#### **User response**

Make sure that any { number } arguments follow the appropriate criteria specification on the command line.

**FSUM6355** 

Badly formed line number "linenumber"

# **Explanation**

You specified a *linenumber* that was not a valid integer.

## **User response**

Specify a valid integer for linenumber.

**FSUM6357** 

Badly formed {repeat} count "number"

## **Explanation**

You specified a { number } that was not a valid integer.

#### **User response**

Specify a valid integer for number.

**FSUM6358** 

too many file names generated, use "-n" option

# **Explanation**

More files need to be generated than csplit was able to generate names for, given the number of digits in the numeric portion of file names.

#### **User response**

Use the -n option to increase the number of digits in the numeric portion of file names.

**FSUM6359** 

Generated filenames would be too long

# **Explanation**

The argument specified for the -n option, when combined with the length of the specified *prefix* resulted in a generated file name that was longer than the file system permits.

#### **User response**

Specify a shorter *prefix* or a lower value for the argument of the -n option.

FSUM6361

cannot create temp file

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6362

unable to pipe to sort command

A system error indicating the cause is displayed with this message.

FSUM6363

cannot open temp file "filename"

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6364** 

tag file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6365** 

Don't know how to process "filename"

# **Explanation**

A file filename was specified which is not a valid C source file. The file is skipped.

# System action

The command continues.

#### User response

If necessary, reissue the ctags shell command with valid C source files as arguments.

FSUM6371

Missing character after -d

#### **Explanation**

You specified the -d option, but did not provide a field separator character as its argument.

#### **User response**

Provide the missing field separator character.

**FSUM6372** 

Unknown option "option"

#### **Explanation**

You specified an option that is not valid for this command.

#### **User response**

Check z/OS UNIX System Services Command Reference for a list of options.

**FSUM6374** 

out of memory

# **Explanation**

There were not enough free system resources to allocate as internal buffers.

#### **User response**

Free up more system resources and try again.

**FSUM6378** 

date: no permission to set date

## **Explanation**

You do not have proper permissions for changing the system date.

## **User response**

If you need the system date changed, talk to your system programmer.

FSUM6380

The option "option" does not contain a "="

# **Explanation**

You specified option without providing the required equals sign (=).

## User response

Provide the missing equals sign.

FSUM6381

dd: cbs=*number* given without ascii/ebcdic/ibm/block/unblock conversion

# **Explanation**

You specified the cbs= size option but did not specify a conversion option which uses it.

#### **User response**

Provide the missing conversion option.

**FSUM6382** 

dd: out of memory for buffers

# **Explanation**

dd was unable to allocate the system resources that it needed for conversion buffers.

#### **User response**

Free up more system resources.

FSUM6383

option=value is an unknown option

# **Explanation**

You specified an option that is not valid for dd.

#### User response

Check z/OS UNIX System Services Command Reference for a list of options.

**FSUM6384** 

full\_blocks+partial\_blocks records in full\_blocks+partial\_blocks records out

#### **Explanation**

Displays the number of full blocks or partial blocks read from input and written to output.

# System action

The command ends.

#### **FSUM6385**

Warning: *file1* is tagged with a different ccsid type than what you specified for conversion.

# **Explanation**

The ccsid of the specified file is either of type ASCII, EBCDIC, or INVALID. Either the conversion type specified by the conversion does not match the encoding type of the ccsid associated with the file, or the ccsid of the specified file is of type invalid. Data may be incorrectly converted.

# **System action**

Processing continues.

## **User response**

Check that the cosid of the file correctly identifies the encoding of the data. Adjust the conv=... option accordingly.

**FSUM6388** 

dd: unknown conversion "string"

# **Explanation**

You specified a conversion value following conv= that **dd** did not recognize.

#### User response

Check z/OS UNIX System Services Command Reference for a list of options.

**FSUM6389** 

dd: badly formed number "num"

# **Explanation**

You specified *num* as a number (for example, a block size), but *num* did not have the form of a number recognized by dd.

#### **User response**

Make sure that *num* is a valid number, and if it is followed by a letter to indicate the block size unit; check the *Options* bs= option for a list of valid letters.

FSUM6390

dd: absolute I/O must be in *number* byte units

# **Explanation**

You attempted to read from, or write to, a device which requires block sizes to be in multiples of its sector size (in this case, *num* bytes).

#### User response

Specify a block size that is a multiple of the device's sector size.

FSUM6391

seek output

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6392

seek input

A system error indicating the cause is displayed with this message.

FSUM6393

read error

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6398** 

File file1 is a type1 while file file2 is a type2

## **Explanation**

The two files specified on the directory were of different file types. diff can only compare files that have the same file type.

#### **User response**

Specify two files that have the same file type.

**FSUM6404** 

directory "pathname"

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6405** 

insufficient memory (try diff -h)

## **Explanation**

**diff** ran out of system resources when generating the data structures used in the differencing algorithm. For information about the limitations, see the Limits section in <u>diff - Compare two text files and show the differences</u> in *z/OS UNIX System Services Command Reference*. **diff** requires fewer system resources than **diff** algorithm. This may allow it to succeed where the regular algorithm fails.

**FSUM6406** 

cannot allocate name buffer

#### **Explanation**

There is not enough main storage to allocate the name buffer.

#### User response

Free up system resources and try again.

**FSUM6407** 

Missing number after "option" option

# **Explanation**

You specified option but did not specify a number following it.

#### User response

Specify a number following the option option.

**FSUM6408** 

Missing #ifdef symbol after -D

## **Explanation**

You did not specify a conditional label on the command line after the -D option.

510 z/OS: z/OS UNIX System Services Messages and Codes

**FSUM6409** 

only one file may be "-"

# **Explanation**

Only one of the two files being compared may be the standard input.

## **User response**

Specify – (standard input) as, at most, one of the two files to be compared.

**FSUM6411** 

internal error--cannot create temporary file

# **Explanation**

**diff** was unable to create a working file that it needed.

## **User response**

Ensure that you either have a /tmp directory or that the environment contains a variable TMPDIR which names a directory where **diff** can store temporary files. Also, ensure that you have sufficient permissions on this directory to create a temporary file.

**FSUM6412** 

couldn't stat file system for "filesystem"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6417** 

too many lines in file "filename"

# **Explanation**

The file *filename* contained more than the value of the INT\_MAX. **diff** cannot handle a file that large. Try **diff** with the -h option.

**FSUM6418** 

opening temporary file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6420** 

string: you must specify exactly 3 input files

#### **Explanation**

You did not specify exactly three input files on the command line.

# **User response**

Specify three input files.

FSUM6422

diff3: no temporary files available

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6423** 

diff3: child process

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6424** 

diff3: "diff" command failed

# **Explanation**

diff3 was unable to complete its function.

# **User response**

Contact your system programmer.

**FSUM6425** 

diff3: Insufficient memory

## **Explanation**

diff3 was unable to allocate storage for all lines in the input files.

# **User response**

Free up more system resources or break up the files.

**FSUM6426** 

diffnumbervs3: unexpected end of file diff.

#### **User response**

Contact your system programmer.

FSUM6427

diffnumbervs3: bad control line n.

#### **User response**

Contact your system programmer.

FSUM6428

diffnumbervs3: expecting `---'; got `n'

#### **User response**

Contact your system programmer.

**FSUM6432** 

Addressed line out of range

# **Explanation**

You specified an address for a command that referenced a line that does not exist.

## **User response**

Modify the address given to correctly reference the desired lines.

**FSUM6433** 

Unknown option "-option".

### **Explanation**

You specified an option that is not valid for this command.

# **User response**

Check z/OS UNIX System Services Command Reference for a list of options.

**512** z/OS: z/OS UNIX System Services Messages and Codes

**FSUM6434** 

Only one file name is allowed.

# **Explanation**

You specified more than one file name on the command line when you invoked ed.

**FSUM6437** 

File filenamesystem\_error

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6439** 

Temporary file error

# **Explanation**

An error occurred when accessing the paging file. For more information, check <u>ed - Use the ed line-oriented text</u> <u>editor</u> in *z/OS UNIX System Services Command Reference*.

## **User response**

See your system programmer.

**FSUM6440** 

**Badly constructed regular expression** 

# **Explanation**

You made an error in the syntax of a regular expression.

# **User response**

Refer to the documentation on regular expressions in z/OS UNIX System Services Command Reference and correct the error.

**FSUM6441** 

No remembered regular expression

#### **Explanation**

You attempted to use & to refer to a remembered regular expression when there was no remembered regular expression.

#### User response

Issue the command again, but specify a regular expression this time.

**FSUM6442** 

Missing trailing delimiter after pattern.

## **Explanation**

You specified a pattern as part of a ed command but did not delimit it.

#### User response

Provide a trailing delimiter for the pattern.

**FSUM6446** 

Out of memory for lines

#### **Explanation**

ed was unable to allocate system resources while trying to insert or append lines to the buffer.

#### **User response**

Split the file into small pieces.

**FSUM6447** 

**Unknown command** 

## **Explanation**

You entered a command that does not exist in ed.

## **User response**

Check the description of ed in z/OS UNIX System Services Command Reference for a list of valid commands.

**FSUM6448** 

Illegal command suffix

## **Explanation**

You specified a command suffix for a command that does not accept suffixes.

## **User response**

Check the description of ed in  $\underline{z/OS\ UNIX\ System\ Services\ Command\ Reference}$  for a list of valid commands and their syntaxes.

**FSUM6450** 

No match found for regular expression

#### **Explanation**

The / command failed to find any matching lines.

#### **User response**

Try a different regular expression.

FSUM6451

Wrong number of addresses for command

#### **Explanation**

You specified the wrong number of addresses for the command that you entered.

#### **User response**

Check the description of ed in  $\underline{z/OS\ UNIX\ System\ Services\ Command\ Reference}$  for a list of valid commands and the number of addresses that you can specify with each.

**FSUM6452** 

**Need space after command** 

#### **Explanation**

You did not separate a command from its file name argument with a space.

# User response

Reenter the command with the required space.

**FSUM6453** 

Name too long

# **Explanation**

The file name specified on the ed command line was too long.

**514** z/OS: z/OS UNIX System Services Messages and Codes

Use a shorter file name.

**FSUM6454** 

**Badly formed name** 

# **Explanation**

You specified an improperly formed or missing file name with a command which requires a file name as an argument (for example, e or f).

# **User response**

Correct or provide the file name.

**FSUM6455** 

Illegal command redirection

# **Explanation**

You attempted to use the ! command redirection with the f command.

## **User response**

Do not use the ! command redirection with the f command.

**FSUM6456** 

Restricted shell

#### **Explanation**

You invoked the restricted form of ed (red), but then tried to use a command that is not allowed in the restricted editor (the ! command).

#### **User response**

See the Description section of the ed man page for a discussion of the differences between ed and red.

**FSUM6457** 

No remembered file name

#### **Explanation**

You tried to execute a command that uses a remembered file name when there was no remembered file name.

## **User response**

Issue the command again, but specify a file name this time.

**FSUM6458** 

Mark name must be lower case

#### **Explanation**

You attempted to use the  ${\bf k}$  command to mark an addressed line with a character other than a lowercase letter.

# **User response**

Use **k** to mark the line with a lowercase letter.

**FSUM6459** 

**Undefined mark name** 

## **Explanation**

You attempted to reference a mark name that you have not assigned.

Use the **k** command to assign the mark name to a line, or specify a previously assigned mark name.

**FSUM6460** 

'm' and 't' require destination address

## **Explanation**

You issued an **m** or **t** command but did not provide a destination address.

### **User response**

Provide a destination address with the **m** or **t** command.

FSUM6461

Destination cannot straddle source in 'm' and 't'

# **Explanation**

You specified a range of lines to be moved or copied by m or t that included the destination address.

# **User response**

Ensure that the specified range of lines for m or t does not include the destination address.

**FSUM6462** 

command not allowed inside g, v, G, or V

# **Explanation**

You specified a command that cannot be used with the issued global command (g, v, G, or v).

# **User response**

Check the description of ed in z/OS UNIX System Services Command Reference for a list of commands that cannot be used with the various global commands.

**FSUM6463** 

Incomplete regular expression.

#### **Explanation**

You issued a g or G command but did not provide a regular expression as an argument.

## **User response**

Provide a regular expression as an argument to the command.

FSUM6464	the x command has become X (upper case)
FSUM6465	Global command too long

#### **Explanation**

You specified a global instruction (g or v) that was longer than 256 characters, including newlines.

#### **User response**

Specify a global instruction that is less than 256 characters in length.

FSUM6466

command: too many environment variables

You specified more than 512 environment variables in a single **env** command.

## **User response**

Do not specify more than 512 environment variables in a single **env** command.

FSUM6469

command: insufficient memory

# **Explanation**

There were not enough free system resources for the command to carry out the desired operation.

#### User response

Free up more system resources.

**FSUM6470** 

**Bad tab stop specification** 

# **Explanation**

You specified an illegal character in a tab stop specification, or you did not specify tab stops in ascending order.

# **User response**

Reenter the command with a valid tab specification.

**FSUM6473** 

expr: internal tree error

# **Explanation**

You specified an expression that expr was unable to evaluate, due to either syntax errors or unusual complexity.

#### **User response**

Correct the syntax errors, or simplify the expression (perhaps by breaking it into parts).

**FSUM6477** 

file: format error in magic file "filename", line line\_num

#### **Explanation**

You specified *filename* as a magic file, but it does not conform to the syntax described in the magic 4 man page.

#### **User response**

Edit *filename* to fit the magic file syntax, or use a valid magic file.

**FSUM6478** 

Only one "-f" option allowed

# **Explanation**

You specified the given option more than once.

#### **User response**

Specify the given option once only.

**FSUM6484** 

unknown type or cannot open

#### **Explanation**

You specified a file that does not exist, cannot be opened, or whose file type cannot be determined.

## **User response**

Check that the file exists and that the file permissions allow access.

**FSUM6498** 

file: no space for read buffer

# **Explanation**

There were not enough free system resources for **file** to allocate a read buffer.

## User response

Free up more system resources.

**FSUM6499** 

file: line line num bad number in magic file

## **Explanation**

You specified a magic file with a line that should contain a number, but it does not.

## **User response**

Make sure that fields in the specified magic file are separated by tabs.

**FSUM6500** 

file: out of space for magic entries

# **Explanation**

There were not enough free system resources for file to allocate for entries from the magic file.

#### **User response**

Free up more system resources.

FSUM6501

file: misplaced > in magic file

#### **Explanation**

You specified a magic file containing a line beginning with a > that did not follow a regular template line.

#### **User response**

Either create a template line before the line, or remove the line.

FSUM6503

find: unable to allocate memory for expression tree

# **Explanation**

find requires system resources to build an expression tree. There were not enough free resources to do so.

#### **User response**

Free up more system resources or specify a less complex expression.

FSUM6504

find: bad number specification in "string"

You specified an option that takes a numeric value (for example, -atime, -ctime), but you did not specify a valid number after the option.

## **User response**

Ensure that options that take a numeric value are followed by a valid number (only decimal digits, preceded by an optional plus or minus sign).

**FSUM6505** 

find: "-type character" is invalid

# **Explanation**

You specified the -type primary but did not follow with a valid character to represent the file type.

#### **User response**

Check the description of **find** in z/OS *UNIX System Services Command Reference* for a list of valid characters for use with the -type primary.

FSUM6506

find: non-terminated "primary" argument list

#### **Explanation**

You specified the -exec or -ok primary and did not terminate the argument list following it with a semicolon (;).

## **User response**

Terminate the argument list following -exec or -ok with a semicolon.

FSUM6507

find: must specify option after primary

#### **Explanation**

You specified -primary, but did not provide the argument that it requires.

#### **User response**

Specify a valid argument after - primary.

FSUM6508

cannot stat file "filename" for -newer

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6510

find: user name "*user*" is unknown

#### **Explanation**

You specified the -user primary, but did not provide a valid user name. Or you specified -acl\_entry primary and the acl\_text has undefined username.

#### **User response**

Provide a valid user name after the -user primary. Or if specified -acl\_entry, provide valid username in the acl\_text.

FSUM6511

find: group name "name" is unknown

You specified the -group primary but did not specify a valid group name. Or you specified -acl\_entry primary and the acl\_text has undefined groupname.

## **User response**

Specify a valid group name after the -group primary. Or if specified -acl\_entry, provide valid groupname in the acl\_text.

FSUM6512

unable to access "pathname"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6513** 

error reading directory "pathname"

## **Explanation**

You attempted to read the directory *pathname*. You do not have read permissions on this directory.

## **User response**

If you need to access the directory *pathname*, see your system manager about acquiring read permissions for that directory. If you do not need to access it, no corrective action is required.

**FSUM6515** 

cannot execute "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6517

Missing offset.

# **Explanation**

You specified the -p option but did not provide an output page offset as an argument.

#### **User response**

Provide the missing output page offset.

**FSUM6518** 

Missing line length.

#### **Explanation**

You specified the -1 option but did not provide a line length as an argument.

#### User response

Provide the missing line length.

**FSUM6519** 

fmt: length "number" is invalid

#### **Explanation**

You specified a line length that was less than zero or greater than the maximum length (as given by the configuration variable LINE\_MAX).

Use a line length in the range zero to LINE\_MAX.

**FSUM6527** 

no room for buffers

## **Explanation**

There were not enough free system resources for grep to allocate the buffers that it requires.

#### **User response**

Free up more system resources.

FSUM6529

out of space for pattern "string"

# **Explanation**

grep did not have enough system resources available to store the code needed to work with the given pattern (regular expression). The usual cause is that the pattern is very complex.

## **User response**

Make the pattern simpler, or free more system resources.

FSUM6535

Badly formed line/character count "num"

#### **Explanation**

The value num, following a -b, -c, -k, -1, -m, or -n option was not a valid number.

# **User response**

Ensure that num is a valid number. Refer to z/OS UNIX System Services Command Reference for more information on the find command.

FSUM6537	The help comma
	that contains m
	_

The help command provides a summary of the command manual pages that contains more information than the usage messages printed by most commands. For example, type: help find for information on the 'find' command.

**Explanation:** 

(None)

FSUM6541 command: invalid user name: "user"

# **Explanation**

You specified a user name that was not found in the user database.

## **User response**

Check that you spelled the user name correctly.

**FSUM6544** 

Bad file number specification in "string"

#### **Explanation**

You specified a file number that was not 1 or 2 with the -j option.

Specify a file number of 1 or 2 when using the -j option.

**FSUM6545** 

Badly constructed output list at "string"

## **Explanation**

You specified an improperly constructed list of output fields with the -o option.

# **User response**

Check the description of **join** in <u>z/OS UNIX System Services Command Reference</u> for details on constructing a list of output fields for the -o option.

**FSUM6546** 

Missing -e string

# **Explanation**

You specified the -e option without a string argument.

## **User response**

Provide the missing string.

**FSUM6547** 

Missing join field number

## **Explanation**

You specified the -j, -1, or -2 option without specifying which field to use as the join field.

#### **User response**

Provide the missing join field number.

**FSUM6548** 

Bad join field number

#### **Explanation**

You specified a value to indicate the join field that was not a valid number.

#### User response

Make sure to use a valid number to indicate join the field.

**FSUM6549** 

Missing character after -t

# **Explanation**

You specified the **-t** option without specifying a field separator as an argument.

#### User response

Provide the missing field separator.

**FSUM6550** 

Must specify -o with -e

## **Explanation**

You specified the **-e** option without also specifying the **-o** option.

Always specify the **-o** option when using the **-e** option.

FSUM6551

join: too many -o list elements

## **Explanation**

You specified more than 512 fields in the list of output fields given as the argument to the -o option.

### **User response**

Specify no more than 512 output fields.

FSUM6553

Out of dfa move space: increase num from number

# **Explanation**

There were not enough move entries for lex to process your input.

# **User response**

Increase move table size with the hexnum directive.

**FSUM6563** 

Error writing temp file 'filename'

#### **Explanation**

An error occurred while trying to write the temporary file filename.

# **User response**

Check the directory indicated by TMPDIR, or /tmp and ensure that the directory is writable and has sufficient space.

**FSUM6564** 

No lex rules

#### **Explanation**

You specified lex input that did not contain any translation rules, possibly due to empty or badly formatted input.

#### **User response**

Make sure that your input file is specified properly, and that the contents are properly formatted.

FSUM6565

Write error on filename

#### **Explanation**

An error occurred while lex was writing the output file.

#### **User response**

Check that space exists on the output device and that you have appropriate permissions to write the file.

FSUM6569

Out of NFA state space: increase num from number

# **Explanation**

You did not reserve enough space for the NFA tables.

Use the *number* directive to increase the space for the NFA tables.

FSUM6570

Out of DFA state space: increase num from number

## **Explanation**

You did not reserve enough space for the DFA tables.

# **User response**

Use the *integer* directive to increase the space for the DFA tables.

FSUM6571

Too many character classes (more than *num* )

# **Explanation**

lex ran out of space for character classes.

# **User response**

Simplify your scanner input.

**FSUM6572** 

Too many translations (more than *num* )

## **Explanation**

lex ran out of space for translation rules.

# **User response**

Simplify your scanner input.

**FSUM6573** 

Table for item too large for machine (num bytes)

# **Explanation**

You attempted to use the lex Malloc function to allocate a block of memory that is larger than the hardware segment size. This error only occurs on systems with segment architecture.

#### User response

Use Malloc to allocate a block of memory that is small than the hardware segment size.

**FSUM6574** 

No more memory for item

# **Explanation**

There were not enough free system resources to allocate to *item*. Your scanner input was too large or too complicated, or you requested too much space for a table.

### User response

Simplify your input expressions, or request less space for tables.

FSUM6579

Too many move (%num) entries: number

#### **Explanation**

You did not reserve enough space for move tables.

524 z/OS: z/OS UNIX System Services Messages and Codes

Use the *hexnum* directive to increase the space for move tables.

#### **FSUM6582**

#### premature eof in prototype

## **Explanation**

lex encountered an end-of-file character in the prototype file when it was not expecting it, probably due to a badly formatted prototype file.

# **User response**

Ensure that the prototype file is not corrupted. If using a private prototype file, ensure that it has the same layout as the distributed version.

#### FSUM6600

#### Cannot use character class or equivalence class in range

## **Explanation**

You attempted to use a character class or an equivalence class (that is, [: :] or [= =]) in a character range within a regular expression.

## **User response**

Rewrite the regular expression.

#### FSUM6601

#### Poorly formed [char sequence (string)

# **Explanation**

You specified a [...], [= =], or [: :] sequence improperly.

#### **User response**

Specify the sequence correctly.

#### FSUM6602

Unknown class [:class:]

#### **Explanation**

You specified a regular expression containing a character class [:class:] that is not supported in the POSIX locale.

#### **User response**

Rewrite the regular expression.

## **FSUM6603**

Unknown collating element [.col element.]

### **Explanation**

You specified a regular expression containing a collating element that is not supported by the POSIX locale.

#### **User response**

Rewrite the regular expression.

#### FSUM6604

Multi-character collating element [.col\_element.] not supported

You specified a regular expression containing a multicharacter collating element that is not supported by the POSIX locale.

# **User response**

Rewrite the regular expression.

**FSUM6605** 

Collation in [= =] not supported (yet)

# **Explanation**

You attempted to use an equivalence class [=[. collation-symbol .]=] within a regular expression. lex does not support this construct.

## **User response**

Rewrite the regular expression.

**FSUM6606** 

Badly formed equivalence class [=equiv class=]

## **Explanation**

You attempted to use a multicharacter equivalence class in a regular expression. Lex does not support non-POSIX locales.

#### **User response**

Rewrite the regular expression.

FSUM6614

command: Option -option argument missing

## **Explanation**

You did not provide an argument for -option.

#### **User response**

Provide the missing argument.

**FSUM6630** 

compress not initialized

#### **Explanation**

The program detected that the compression file was not properly initialized.

# System action

The program ends.

#### System programmer response

Follow local procedures for reporting a problem to IBM.

#### **User response**

Contact your system programmer.

**FSUM6631** 

bits must be from num1 to num2

You specified a value for the maximum number of bits of compression that outside the range num1 to num2.

### **User response**

Specify a value in the range num1 to num2.

#### FSUM6632

no space for compression tables

## **Explanation**

There were not enough free system resources to allocate to compression tables.

### **User response**

Free up more resources.

#### **FSUM6633**

compression not closed

### **Explanation**

The program attempted to open a compression file that was already open and initialized.

## **System action**

The program ends.

### System programmer response

Follow local procedures for reporting a problem to IBM.

### **User response**

Contact your system programmer.

**FSUM6634** 

compress: unknown error

## **Explanation**

An unknown compression error occurred.

## **User response**

Contact your system programmer.

#### **FSUM6635**

not initialized

### **Explanation**

The program attempted to close a file that was not initialized.

## **System action**

The program ends.

### System programmer response

Follow local procedures for reporting a problem to IBM.

### **User response**

Contact your system programmer.

#### **FSUM6636**

not in compressed format

## **Explanation**

You specified a file to be uncompressed that was not in compressed format.

## **User response**

Specify a compressed file.

FSUM6637

compressed with num1 bits, can only handle num2 bits

# **Explanation**

You specified a file to be uncompressed that was compressed with *num1* bits, but this version of uncompress handles a maximum of *num2* bit compression.

#### **User response**

Request a copy of the file compressed using *num2* bit compression.

**FSUM6638** 

no space for decompress tables

### **Explanation**

There were not enough free system resources for uncompress to allocate to the decompress tables.

#### **User response**

Free up more resources.

**FSUM6639** 

compressed file is corrupt

#### **Explanation**

You specified a compressed file that was damaged.

### **User response**

Get a new copy of file and try again.

**FSUM6640** 

not closed

## **Explanation**

The program attempted to open a file that was already open and initialized.

# **System action**

The program ends.

#### System programmer response

Follow local procedures for reporting a problem to IBM.

Contact your system programmer.

FSUM6641

unknown error

## **Explanation**

An unknown decompression error occurred.

### **User response**

Contact your system programmer.

FSUM6642

**Insufficient memory** 

### **Explanation**

There were not enough free system resources to perform the specified operation.

## **User response**

Free up more resources.

**FSUM6643** 

getgroups failed

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6644

Unknown or missing operator in symbolic mode "modestring"

### **Explanation**

When using the symbolic mode to indicate new access permissions, you specified a string *modestring* which was either missing an operator or contained an unrecognized operator.

#### **User response**

Make sure that all *mode* values in symbolic mode contain one of the following operators: +, -, or =.

**FSUM6645** 

Octal mode may contain only digits [0-7] in numstring

### **Explanation**

When using the octal mode to indicate new access permissions, you specified a string *numstring* which contained a character other than the digits 0 to 7.

#### **User response**

Make sure that all mode values in octal mode are valid octal numbers, containing only the digits 0 through 7.

**FSUM6647** 

failed to match

# **Explanation**

A match was found for the specified regular expression.

### **User response**

No action is required.

#### **FSUM6648**

#### invalid collation element

### **Explanation**

You specified a regular expression that contains an invalid collating element.

## **User response**

Make sure that all collating elements in the regular expression are valid in the locale indicated by LC\_COLLATE.

**FSUM6649** 

trailing \ in pattern

# **Explanation**

You specified a regular expression with a trailing \.

## **User response**

Remove the trailing \ or complete the escape sequence.

**FSUM6650** 

newline found before end of pattern

### **Explanation**

You specified a regular expression that contained a newline before the end of the pattern.

### **User response**

Check the regular expression for a missing /.

FSUM6652

number in \[0-9] invalid

### **Explanation**

You specified a number that was greater than the number of matching subexpressions.

## User response

Specify a number that is less than or equal to the number of matching subexpressions.

**FSUM6653** 

[] imbalance or syntax error

#### **Explanation**

You specified a regular expression that contained a [ ] imbalance.

#### **User response**

Make sure that all [ and ] characters appear in matched pairs in the regular expression.

**FSUM6654** 

() or \(\) imbalance

## **Explanation**

You specified a regular expression that contained a () or  $\setminus$  ( $\setminus$ ) imbalance.

### **User response**

Make sure that all ( and ) characters and all  $\setminus$  ( and  $\setminus$ ) characters appear in matched pairs in the regular expression.

530 z/OS: z/OS UNIX System Services Messages and Codes

**FSUM6655** 

{} or \{ \} imbalance

# **Explanation**

You specified a regular expression that contained a  $\{\}$  or  $\{\}$  imbalance.

## **User response**

Make sure that all  $\{$  and  $\}$  characters and all  $\setminus \{$  and  $\setminus \}$  characters appear in matched pairs in the regular expression.

FSUM6656

invalid endpoint in range

# **Explanation**

You specified a regular expression that contained a range expression with an invalid endpoint.

## **User response**

Specify a valid endpoint.

**FSUM6658** 

invalid character class type

## **Explanation**

You specified a regular expression that contained a reference to an invalid character class.

### **User response**

Make sure that all character classes referenced in the regular expression are valid in the locale indicated by LC\_CTYPE.

FSUM6659

syntax error

# **Explanation**

You specified an invalid regular expression.

#### User response

Correct the syntax of the regular expression.

**FSUM6660** 

contents of { } or \{ \} invalid

# **Explanation**

The contents of  $\{ \}$  or  $\{ \}$  in the specified regular expression were invalid: not a number, too large a number, more than two numbers, first number larger than second.

### **User response**

Make sure that the contents of  $\{\}$  or  $\{\}$  are valid.

FSUM6661

internal error

## **Explanation**

There was an internal error during the processing of a regular expression.

### **System action**

The program ends.

#### **User response**

Follow local procedures for reporting problems to IBM.

#### FSUM6662

unknown regex error

## **Explanation**

The error code that was passed to regerror is not a known error.

### User response

Check your program to verify that errcode was retrieved from regexec or regcomp.

FSUM6700

Charmap information not available.

# **Explanation**

For some reason, locale was unable to list the set of available charmap files.

### **User response**

Contact your system programmer.

FSUM6701

Unknown keyword name 'name'.

# **Explanation**

You specified a *name* that is not a keyword.

### **User response**

Specify a valid keyword name.

#### FSUM6708

The following required symbolic names are missing from the charmap file:

## **Explanation**

You specified a charmap file that did not contain certain required symbolic names.

#### User response

Add the appropriate symbolic names to the charmap file or specify a charmap file that does contain these names.

#### **FSUM6710**

Character \x hexnum not specified in charmap file

#### **Explanation**

You specified a character (with hexadecimal value hexnum) that was not contained in the charmap file.

## **User response**

Add the character to the charmap file or specify a charmap file that contains this character.

#### **FSUM6715**

Implementation restriction. Too many one-to-many mappings; limit *num* 

### **Explanation**

You specified too many one-to-many mappings. The maximum is *num*.

### **User response**

Specify no more than *num* one-to-many mappings.

**FSUM6721** 

unknown category name

## **Explanation**

You specified a category that was not LC\_CTYPE, LC\_COLLATE, LC\_TIME, LC\_NUMERIC, LC\_MONETARY, or LC\_MESSAGES.

### **User response**

Ensure that you have spelled the category name correctly and that it is one LC\_CTYPE, LC\_COLLATE, LC\_TIME, LC\_NUMERIC, LC\_MONETARY, or LC\_MESSAGES.

**FSUM6729** 

regular expr error: regular\_expression\_error

### **Explanation**

You have entered a regular expression incorrectly. See the regular expressions (regexp) section of z/OS UNIX System Services Command Reference for more information.

**FSUM6731** 

Missing order\_start keyword

#### **Explanation**

You failed to specify an order\_start keyword in the LC\_COLLATE category definition.

### **User response**

Provide the missing keyword.

**FSUM6733** 

order\_start: Too many sort-rules; limit COLL\_WEIGHTS\_MAX (num)

### **Explanation**

You specified too many sort-rules with the order\_start keyword. You are limited to *num* rules, as specified by the configuration variable COLL\_WEIGHTS\_MAX.

#### **User response**

Specify fewer sort-rules.

**FSUM6734** 

order\_start: forward/backward are mutually exclusive

# **Explanation**

You specified both the forward and the backward directives as sort-rules with the order\_start keyword. These directives are mutually exclusive; you can specify one or the other but not both.

Remove either the forward or the backward directive.

**FSUM6736** 

order\_start keyword specified *num1* weights; collating element entry for <symbol> gave *num2* weights

## **Explanation**

The entry for the *symbol* collating element specified *num2* weights, while the order\_start keyword specified that should be *num1*. The number of weights should be the same in both place.

### **User response**

Ensure that the number of weights for all collating elements agrees with the number of weights given by the order\_start keyword.

**FSUM6737** 

**Multiple UNDEFINED entries specified** 

# **Explanation**

The special symbol UNDEFINED appeared more than once in the collation order.

## **User response**

Remove extra occurrences of UNDEFINED.

**FSUM6738** 

Too many weights; limit COLL\_WEIGHTS\_MAX (num)

## **Explanation**

You specified too many weights in a collation entry. The maximum number of weights is given by the configuration variable COLL\_WEIGHTS\_MAX (which has the value *num*).

### **User response**

Specify no more than *num* weights for any collation entry.

**FSUM6739** 

Multi-character collating element too long; limit num

### **Explanation**

You specified a multicharacter collating element that was more than *num* characters long.

#### **User response**

Make sure that no multicharacter collating element is more than num characters long.

FSUM6741

reading file "filename"

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6743** 

String too long -- limit 255 bytes

#### **Explanation**

You specified a string that was longer than 255 bytes.

Make sure that all strings are no longer than 255 bytes.

**FSUM6745** 

**Insufficient memory** 

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6747** 

LC\_TIME: keyword keyword: Expecting num1 arguments, found num2

### **Explanation**

You specified an incorrect number of arguments for the keyword keyword in the LC\_TIME category.

### **User response**

Make sure that you specify the correct number of arguments for each LC\_TIME keyword.

**FSUM6748** 

LC\_TIME: keyword keyword: already specified

# **Explanation**

You attempted to specify an LC\_TIME keyword that had already been specified.

# **User response**

Make sure that LC\_TIME keyword is specified only once.

FSUM6749

LC\_TIME: keyword keyword is missing

### **Explanation**

You failed to specify a mandatory LC\_TIME keyword.

### **User response**

Provide the missing keyword.

**FSUM6751** 

Directory "pathname"

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6752

charmap file "string"

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6753** 

sourcefile "filename"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6754** 

<symbolic-name> too long; limit num characters

## **Explanation**

You specified a <symbolic-name> that was longer than *num* characters.

### **User response**

Make sure that no <symbolic-name> is longer than *num* characters.

FSUM6755

Invalid character hexnum in a symbolic-name

## **Explanation**

A symbolic-name included an invalid character which had the hexadecimal value hexnum.

### User response

Make sure that all characters in the symbolic-name are valid.

FSUM6762

console device "dev"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6763** 

writing to console device "dev"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6764** 

logname: cannot get login name

#### **Explanation**

logname was unable to access the system utmpx file, or the process was not a currently logged in user.

### **User response**

Check that the system utmpx file is accessible.

**FSUM6768** 

opening archive arch\_name

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6769** 

string is not a valid archive

# **Explanation**

arch\_name is not a valid archive. The recognized formats are system specific.

### **User response**

Ensure that you specified the correct file.

**FSUM6770** 

insufficient memory

### **Explanation**

A system error indicating the cause is displayed with this message.

**536** z/OS: z/OS UNIX System Services Messages and Codes

**FSUM6771** 

opening temporary archive arch\_name

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6773** 

rename arch\_name1 to arch\_name2

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6776** 

nm: not enough memory for symbol table

### **Explanation**

There are not enough free system resources to allocate to the symbol table.

### **User response**

Free up more resources.

**FSUM6777** 

command: file "string": Not an object, executable, or library file

### **Explanation**

You specified a file on the command line that is not an object file, executable file, or library file.

## **User response**

Make sure that you specify a file that is one of these three types.

**FSUM6780** 

executable file "filename"

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6781

command: file "string": Not an executable file

### **Explanation**

You specified a file on the command line that is not an executable file.

#### **User response**

Specify an executable file.

**FSUM6784** 

cannot allocate memory for sorting

#### **Explanation**

There were not enough system resources available for 1s to sort its output.

### **User response**

Free up more system resources or use option and path names on the command that will produce less output.

**FSUM6785** 

File or directory "name" is not found

You specified a pathname that does not exist.

#### **User response**

Check to make sure that you did not omit or misspell any components of pathname.

**FSUM6786** 

too many directory entries in "dir"

# **Explanation**

1s ran out of dynamically allocated system resources.

### User response

Free up more system resources.

**FSUM6789** 

allocating structure

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6793** 

**EOF** in arg list

# **Explanation**

An end of file was encountered while evaluating the argument list of a macro. The closing parenthesis was not found.

# **User response**

Check for an omitted closing parenthesis, or truncated input file. Remember that unquoted parentheses in macro arguments must be balanced.

**FSUM6795** 

**EOF** in comment

## **Explanation**

An end of file was encountered while copying a comment. The end-of-comment string was not found.

## **User response**

Check for a missing or mis-typed end-of-comment string (set by the \\*[MACRO changecom] macro), or a truncated input file.

**FSUM6796** 

**EOF** in quoted string

#### **Explanation**

An end of file was encountered while scanning a quoted string.

### **User response**

Check for a missing closing string quote (set by the \\*[MACRO changequote] macro), or a truncated input file.

FSUM6802

tempnam() failure

A system error indicating the cause is displayed with this message.

FSUM6803

diversion temporary file "filename"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6807** 

expression syntax error

### **Explanation**

You specified an expression argument that was not a well-formed expression.

#### **User response**

Check for unbalanced parentheses, missing quotes, and undefined variables.

**FSUM6808** 

unbalanced ()

# **Explanation**

An expression contained an unbalanced pair of parentheses.

### User response

Provide the missing parenthesis.

FSUM6809	internal expression tree botch
FSUM6810	defn(builtin) in expression

### **Explanation**

The expression supplied to the \\*[MACRO eval] macro contains the definition of a built-in macro (as yielded by the \\*[MACRO defn] macro).

## **User response**

Either you did not mean to use \\*[MACRO defn] here, or you meant to apply it to a macro of your own definition, rather than to a built-in macro.

FSUM6811

no assignments in `eval'

# **Explanation**

You attempted to pass an expression to the \\*[MACRO eval] macro that contained an assignment operation. The \\*[MACRO eval] macro cannot perform assignments.

#### User response

Do not pass include assignment operations in expressions being passed to \\*[MACRO eval].

**FSUM6813** 

misplaced binary operator

#### **Explanation**

An expression contained a binary operator that was not between two integers.

### **User response**

Make sure that all binary operators have an integer on each side.

**FSUM6815** 

insufficient memory to store evaluation

## **Explanation**

There were not enough free system resources to store the evaluation of the expression.

## **User response**

Free up more resources.

**FSUM6816** 

creating temporary file name

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6817** 

temporary file "filename"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6818** 

Missing number of hops after "-h"

# **Explanation**

You specified the **-h** option without an argument.

#### **User response**

Provide the missing argument.

FSUM6819

Missing address after "-r"

# **Explanation**

You specified the **-r** option without an address argument.

#### **User response**

Provide the missing address argument.

FSUM6820

Missing subject after "-s"

# **Explanation**

You specified the **-s** option without providing a subject string as an argument.

## **User response**

Provide the missing subject string.

**FSUM6821** 

Missing user after "-u"

### **Explanation**

You specified the -u option without a user name argument.

**540** z/OS: z/OS UNIX System Services Messages and Codes

Provide the missing user name.

#### **FSUM6822**

Options applying only to interactive use were given.

## **Explanation**

You specified the -e, -f, -H, -N, or -u options when attempting to send mail. These options are only for use when reading mail.

## **User response**

Check the description of mailx 1 in z/OS UNIX System Services Command Reference for usable options when sending mail.

**FSUM6823** 

command: no interactive rmail use

# **Explanation**

You attempted to use interactive mailx commands after calling mailx with the name rmail.

### **User response**

Do not use interactive commands with rmail.

**FSUM6826** 

variable storage

## **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6827

string: read-only variable

#### **Explanation**

You cannot change the values of some environment variables, such as HOME and MAILRC, from within mailx. You tried to change the value of such a variable.

#### **User response**

Do not try to change the value of read-only variables.

**FSUM6828** 

string: no such variable

### **Explanation**

You tried to make use of a variable that does not exist.

#### **User response**

Check to make sure that you have spelled the variable name correctly or define the variable with a set command.

**FSUM6829** 

building pathname pathname

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6830

Misplaced shell meta-character

## **Explanation**

You provided an invalid file name pattern.

#### **User response**

Ensure that the pattern given is correct.

#### FSUM6831

#### **Expansion memory allocation failure**

# **Explanation**

The system could not allocate sufficient system resources to perform the requested operation.

### User response

Free up more resources.

**FSUM6832** 

**Shell syntax error** 

### **Explanation**

You provided an invalid file name pattern.

### **User response**

Ensure that the pattern given is correct.

**FSUM6833** 

**Ambiguous** 

## **Explanation**

You provided a file name pattern that expanded into more than one file name.

### **User response**

Be more specific in naming the file you want.

**FSUM6834** 

alias storage

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6835** 

string: no such alias

#### **Explanation**

You attempted to unalias alias; however, no alias with this name exists.

### **User response**

Make sure that you spelled alias correctly, or specify an alias that does exist.

**FSUM6860** 

Missing file name

### **Explanation**

You issued a command which requires a file name without providing one.

Specify a file name.

FSUM6861

Missing pipe command

## **Explanation**

You specified the ~ command without providing a shell command.

## **User response**

Provide the missing shell command.

FSUM6864

fork failed

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6865** 

mail to command "command\_name"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6866** 

mail to file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6869** 

No recipients specified

### **Explanation**

You attempted to send a mail message without specifying any recipients.

## **User response**

When sending mail, please specify recipients either on the command line or on the carbon copy (or blind carbon copy) list.

**FSUM6879** 

string: no matching "if" statement

#### **Explanation**

You issued an **else** or **endif** command without a corresponding **if** command.

#### **User response**

Ensure that all **else** and **endif** commands are preceded by an **if** command.

FSUM6880

EOF inside "if" statement

### **Explanation**

While processing an **if** command, mailx encountered an end-of-file condition.

If the **if** command is in your start-up file, ensure that you have included a corresponding **endif** command. If you are entering the **if** in command mode, do not enter the EOF character before issuing the **endif** command.

FSUM6881

cannot lock file "filename"

# **Explanation**

mailx was unable to acquire exclusive access to a mail folder.

## **User response**

Wait for a little while and try again.

**FSUM6882** 

rewriting "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6883** 

allocating message header

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6884** 

allocating message address

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6894** 

No applicable messages.

#### **Explanation**

You specified a message list that does not match any messages in the current mailbox.

## **User response**

No action required.

**FSUM6900** 

**Invalid message number** 

#### **Explanation**

You used a message number of 0 or one that is greater than the number of messages in the mailbox.

### User response

Use a message number in the range from 1 to the number of messages in the mailbox.

FSUM6901

Inappropriate message

### **Explanation**

You tried to perform a command on an inappropriate message. For example, you tried to undelete a message that was not deleted or you tried to respond to a deleted message.

Check the description of the command you are using to ensure that you are using it correctly.

FSUM6902

No applicable messages

## **Explanation**

You specified a message list that does not match any messages in the current mailbox.

### **User response**

No action required.

FSUM6903

Referencing before first message

### **Explanation**

You used the - notation to try to reference the message before the first one in the mailbox.

## **User response**

Do not use - when the current message is the first message in the mailbox.

**FSUM6904** 

Referencing beyond last message

## **Explanation**

You used the + notation to try to reference the next message when the current message was the last one in the mailbox.

#### **User response**

Do not use + when the current message is the last message in the mailbox.

**FSUM6905** 

Non-numeric second argument

#### **Explanation**

The second argument in a message list was not numeric.

### **User response**

Ensure that, when specifying a range of messages as arguments for a command, you indicate the first and last message in the range with integers in the range 1 to the number of messages in the current mailbox.

**FSUM6906** 

No args expected

#### **Explanation**

You specified arguments for a command that does not take arguments.

#### **User response**

Do not specify arguments for this command.

**FSUM6907** 

Only one arg allowed

You attempted to use a command that takes only one argument, but you specified either more or less than one argument.

#### **User response**

Specify only one argument for this command.

**FSUM6908** 

Variable "cmd" not set.

## **Explanation**

You attempted to use the **pipe** command without specifying a shell command to pipe the messages through and the variable cmd was not set.

### **User response**

Either specify a shell command with **pipe** or set the cmd to a default shell command to use with **pipe** when no shell command is explicitly specified.

FSUM6909

command "command"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6911** 

No value set for "folder" variable

# **Explanation**

You have not provided a value for the mailx variable folder.

#### **User response**

Provide a value for the variable folder either in the start-up file or in command mode.

FSUM6912

No previous file.

#### **Explanation**

You used # to represent the file name of the previous file when there was no previous file.

#### **User response**

Use a different file name indicator.

**FSUM6934** 

Cannot nest "if"s

#### **Explanation**

You attempted to nest one if command within another.

### **User response**

Do not nest if commands.

**FSUM6935** 

if: "s" or "r" are permissible arguments

You used an argument other than s or r with the **if** command.

## **User response**

Use only s or r as the argument for an **if** command.

FSUM6939

Missing file after source command

# **Explanation**

You issued a **source** without specifying a file name.

### User response

Specify a file name with the **source** command.

FSUM6940

command file "cmdfile\_name"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6954** 

string: cannot find out who you are

# **Explanation**

The mailx command was unable to find your user ID.

# **User response**

Check with your system programmer.

**FSUM6955** 

fork for shell

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6956** 

copy buffer

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6960

No entry for "entry" in section section of the manual.

# **Explanation**

man found no man page for entry in the specified section of the manual.

# **User response**

Check that you spelled *entry* correctly, that you specified the correct section of the manual, and that the man command will search the path containing its man page.

FSUM6961

No manual entry for "entry".

man found no man page for entry in any section of the manual.

#### **User response**

Check that you spelled entry correctly, and that man command searches the path containing its man page.

**FSUM6962** 

string: nothing appropriate

# **Explanation**

man found no entries for the specified *keyword* in the whatis database.

### User response

Check that you spelled keyword correctly. Try a related keyword.

**FSUM6963** 

system call failed

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6967** 

Unknown operand "string"

### **Explanation**

You specified an operand *string* that was not the required yes or no expression (normally y or n but may differ for other languages).

# **User response**

Specify y or n as operands to mesg. For other languages, check LC\_MESSAGES for the appropriate syntax.

**FSUM6968** 

string: unknown terminal

### **Explanation**

mesg was unable to determine a path for the terminal name, or none of standard input, standard output, and standard error were a terminal.

# **User response**

Make sure that standard input is a terminal, not a redirected file or a pipe.

**FSUM6969** 

terminal "term"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6975** 

fifo file "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM6977** 

Missing major/minor device

You failed to specify the major or minor device type argument for a character or block special file.

### **User response**

Provide the missing argument.

FSUM6978

character special file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

FSUM6979

block special file "filename"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7007** 

Not that many files ...

## **Explanation**

When using the :p or :n commands, you specified a value for n that would move you past the beginning or the end of the file list.

#### **User response**

Specify a smaller value for n.

**FSUM7008** 

No other file ...

#### **Explanation**

When using the :e command, you specified a file name of #; however, there was no previous file.

### User response

Specify the desired file name explicitly.

FSUM7009

Not enough lines to scroll...

## **Explanation**

When using one of the scrolling commands, you specified a value for n that would move you past the beginning or the end of the file.

#### **User response**

Specify a smaller value for n.

FSUM7012

Badly constructed regular expression.

# **Explanation**

more encountered a syntax error in a regular expression.

### **User response**

Check the syntax of the regular expression.

#### **FSUM7013**

No remembered regular expression.

# **Explanation**

You tried to use a remembered regular expression; however, there was no remembered regular expression.

### **User response**

Specify the regular expression explicitly.

FSUM7014

No match found for regular expression.

# **Explanation**

more did not find a match for the specified regular expression.

## **User response**

Check that the regular expression was entered correctly.

**FSUM7015** 

Tag tagname not found.

### **Explanation**

You tried to move to tag tagname, but more could not find it.

### **User response**

Check to see that you entered tagname correctly.

FSUM7016

No tags file present.

### **Explanation**

more was unable to open the tags file.

### User response

Check that the file tags exists, and that you have appropriate permissions.

**FSUM7017** 

filename: Not a text file

#### **Explanation**

You specified the file *filename* which was not a text file.

#### **User response**

Specify a text file.

FSUM7019

string: cannot reopen input file

## **Explanation**

You attempted to view a previously viewed file with the **:e** command, and when more tried to reopen that file, it could not, or you attempted to reopen the current file (due to a **R** command or the completion of a shell escape command) and it failed.

Find out what caused the file become unopenable, and fix the problem.

**FSUM7024** 

command: interactive terminal inaccessible

### **Explanation**

more was unable to open the terminal for input.

### **User response**

Make sure that the standard input is assigned to a terminal.

**FSUM7027** 

invalid command: command

## **Explanation**

The command argument to -p or + was invalid.

## **User response**

Fix the syntax of command.

**FSUM7028** 

No such mark

### **Explanation**

You attempted to move to a mark using the 'letter command, but you never defined the mark letter with a **m**letter command.

# **User response**

Check the name of the mark to which you intended to move, and enter the correct name with the 'command, or define a mark with the name specified.

FSUM7029

command: cannot create temporary file

### **Explanation**

more was unable to create a working file that it needed.

### **User response**

Ensure that you either have a /tmp directory or that the environment contains a variable TMPDIR which names a directory where more can store temporary files. Also, ensure that you have sufficient permissions on this directory to create a temporary file.

FSUM7030

--More--

# **Explanation**

This message is displayed at the bottom of the screen when the more command is running.

**FSUM7031** 

cannot create file "filename"

#### **Explanation**

You attempted to use the **:w** *filename* command, but more was unable to create the file, probably due to the existence of a file with that name, no space on the destination device, or inappropriate permissions on the destination directory.

Check that *filename* does not already exist, that there is space on the destination device, and that you have appropriate permissions on the destination device.

FSUM7033

command: unable to find your user name

### **Explanation**

newgrp was unable to find your user name in the system user database.

### **User response**

Contact your system programmer.

**FSUM7034** 

command: unknown group "groupname"

# **Explanation**

You specified a groupname that was not in the system group database.

### **User response**

Use the id command to get a list of all groups you may access.

**FSUM7035** 

setgroups call failed

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7036** 

set group ID to groupname

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7037

setuid

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7038** 

exec default shell "shell"

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7054

Badly formed number in "string"

#### **Explanation**

You specified an option which requires a numeric argument, but the argument given was not a valid number.

#### **User response**

Provide a valid number as an argument.

**FSUM7057** 

Unknown format character "character"

You specified an unrecognized format character as an argument to the -t option.

## **User response**

Check the description of **od** in  $\underline{z/OS}$  UNIX System Services Command Reference for a list of valid format characters.

FSUM7058

Invalid size modifier for "character" format

## **Explanation**

You specified an invalid size modifier for the *char* format character.

# **User response**

Check the description of **od** in  $\underline{z/OS\ UNIX\ System\ Services\ Command\ Reference}$  for the valid size modifiers for each format character.

FSUM7059

Missing argument for "-character" option

## **Explanation**

You specified the -opt option but did not follow it with the expected argument.

## **User response**

Provide the expected argument. Check the description of **od** in <u>z/OS UNIX System Services Command Reference</u> for a list of valid options and their arguments.

FSUM7060

seek error on input

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7061** 

od: badly formed offset "string"

#### **Explanation**

You specified an offset that was not a decimal or octal value.

### **User response**

Specify a valid *offset*.

FSUM7062

od: offset must be multiple of 512

#### **Explanation**

You specified an offset value that was not a multiple of 512.

### **User response**

Specify an offset value that is a multiple of 512.

FSUM7063

too many output formats, (maximum number)

You specified too many output formats on the **od** command line. The maximum number of output formats is *num*.

### **User response**

Do not specify more than *num* output formats on the **od** command line.

**FSUM7065** 

has links

## **Explanation**

You specified a file that has more than one link.

### **User response**

You can force *filename* to be packed with the -f option.

FSUM7066

already packed

## **Explanation**

You specified a *filename* that appeared to be a pack file.

### **User response**

You can force *filename* to be packed with the -f option.

FSUM7067

no saving

# **Explanation**

You specified a file that was too small or uniform to benefit from packing.

### **User response**

You can force *filename* to be packed with the -f option.

**FSUM7068** 

can't pack in place

## **Explanation**

You specified a file that was too large to pack in place.

### **User response**

Specify an output file with the -o option.

FSUM7070

command: filename already exists

# **Explanation**

pack attempted to write its output to the file filename, but the file already existed.

### **User response**

Delete or rename filename.

**FSUM7078** 

seek on file "filename"

A system error indicating the cause is displayed with this message.

**FSUM7079** 

truncate file "filename" to length number failed

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7080** 

setting time on file "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7081

tempnam() error

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7082** 

tempfile error on "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7083** 

rename filename1 to filename2

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7084** 

not a packed file

# **Explanation**

You specified an input file that was not a packed file.

# **User response**

Make sure that you specified the correct file name. If it is correct, use the **file** utility to see if it was a compressed file.

**FSUM7085** 

decoding tree truncated

#### **Explanation**

You specified a packed file that was damaged.

### **User response**

Specify a packed file that is not damaged.

**FSUM7086** 

tempfile error

## **Explanation**

An error occurred while writing the unpacked file.

### **User response**

Make sure that TMPDIR points to a writable directory, or if TMPDIR is not set, that /tmp is a writable directory.

**FSUM7087** 

data truncated

# **Explanation**

You specified a packed file that was damaged.

### **User response**

Specify a packed file that is not damaged.

**FSUM7089** 

file size for "filename" is greater than or equal to INT\_MAX. Use compress.

## **Explanation**

**pack** does not support files that are of INT\_MAX size or larger and is obsolescent to the compress utility. The **compress** utility can handle large files.

#### **User response**

Use the compress utility.

**FSUM7106** 

cannot determine OPEN\_MAX

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7107** 

paste: must specify input files

#### **Explanation**

You did not specify any input files.

#### **User response**

Specify at least one input file.

**FSUM7108** 

paste: too many files at "filename"

# **Explanation**

You specified more files than paste can handle. *filename* is the first file that paste was unable to open. The number of files that paste can open depends on the number of files that other processes have open.

#### User response

Close files that other processes have open to increase the number of files that paste can open.

**FSUM7119** 

command: Too many file arguments.

#### **Explanation**

You specified more than one file to be patched on the command line.

Do not specify more than one file to be patched on the command line.

**FSUM7120** 

string: missing argument after "-command" option

## **Explanation**

You specified -option without providing the required argument.

### **User response**

Check the *Options* section of the **patch** man page for a list of options and their arguments.

**FSUM7131** 

Out of space or reached the end of the archive file. If you want to go on, type device or file name when ready.

# **Explanation**

There is no more room to write the archive or extract members, or the end of the archive file has been reached. It is also possible that the archive is corrupt.

#### **User response**

Press CTRL-C to terminate the command or enter the name of a device or file to continue. If there is no additional device or file, press CTRL-C to terminate the command and verify that the archive is not corrupt.

FSUM7139

command: compress: string

## **Explanation**

A problem occurred in the compression of the archive.

#### **User response**

See the compress man page for a full list of possible compression errors.

FSUM7140

command: decompress: string

#### **Explanation**

Normally implies that the archive is corrupted.

#### **User response**

See the uncompress man page for a full list of possible compression errors.

FSUM7141

Unable to open terminal "term"

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7142** 

Existing file "filename" is newer

#### **Explanation**

filename was not extracted from the archive because an existing file with the same name was newer.

### **User response**

If you really want to extract filename, use the -u option.

**FSUM7143** 

cannot create parent directory to "pathname"

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7144** 

cannot link "name1" to "name2"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7145** 

command: pathname: links not supported by OS

## **Explanation**

The pax, tax, or cpio file being extracted contained hard links, which are not supported by the operating system. These files are not extracted.

### User response

Since this message appears only on systems with no hard link support, there is no way to extract the file as a hard link. One can manually make a copy of the file referenced by the link.

**FSUM7146** 

name1 symbolic link to name2

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7147** 

name1 link to name2

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7148

cannot create file "filename"

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7151

I/O buffer allocation

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7152

command: -6 not supported

## **Explanation**

You specified the -6 option, which is not currently implemented.

### **User response**

Do not use the -6 option.

558 z/OS: z/OS UNIX System Services Messages and Codes

FSUM7153

command: Unknown option "-option"

### **Explanation**

You specified an option that is not valid for this command.

### **User response**

Check z/OS UNIX System Services Command Reference for a list of options.

**FSUM7154** 

Must specify one of -i, -o, or -p

## **Explanation**

When using cpio, you must specify one and only one of the -i, -o, or -p options.

## **User response**

Specify one of the required options.

**FSUM7155** 

command: -r option disabled with -p

# **Explanation**

cpio cannot use the -r option (rename files) with -p (pass, which copies files from one location to another directory).

### **User response**

When using the -p option, do not also specify the -r option.

**FSUM7158** 

Bad magic number in archive

### **Explanation**

Either the wrong file was passed, or the file has been corrupted.

### **User response**

Check your archive file.

FSUM7159

filename: unsupported file mode mode

# **Explanation**

When creating a cpio archive, the mode (file type) of the specified file on the file system is not valid for including in a cpio archive.

### **User response**

Check the file type of the named file, and correct if possible. (The file type may be an extension to POSIX, which is valid on the host operating system, but shouldn't be included in a portable cpio archive.)

**FSUM7160** 

command: Unknown mode field mode

### **Explanation**

The type of the file specified in the *mode* field of the cpio archive is not supported by the operating system.

### **User response**

No action possible, as the file cannot exist on the host system.

**FSUM7161** 

command: "string" not found.

## **Explanation**

You specified the name of an archive member, but it was not found in the archive.

## **User response**

Get a full table of contents of the archive to see if you are using the correct name.

FSUM7162

command: file "filename": Unable to represent filename in ISO/IEC 8859 -- not saved

# **Explanation**

Characters in *filename* cannot be represented in the character set used in tar archives.

### **User response**

Rename the specified file to contain only characters in ISO/IEC 8859.

FSUM7163

symbolic link filename

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7164** 

**Bad format in header** 

### **Explanation**

Either the wrong file was passed, or the file has been corrupted.

#### **User response**

Check your archive file.

**FSUM7165** 

command: archive file name >num characters

### **Explanation**

The archive contained a path name that was longer than that permitted on the local system.

### **User response**

Re-create the archive using a shorter relative path.

**FSUM7167** 

command: interactive EOF

# **Explanation**

When using the interactive rename option, an end-of-file was encountered.

#### **User response**

None.

#### **FSUM7169**

command: cannot set access/modify time on "filename"

# **Explanation**

While *filename* was being restored, the timestamp could not be restored to its original value. This is most likely due to the lack of appropriate permission to the file.

## **System action**

The program ends.

### **User response**

Obtain the appropriate permission, or disable the restoring of the timestamp by using the -pm option (for pax) or the -m option (for tar).

FSUM7170 filename: cannot set mode

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7171 filename: cannot set uid/gid

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7172

Warning: file "file": character "character"

# **Explanation**

While attempting to convert data in the archive during a read or write, pax encountered a character that could not be converted to the desired code set. The character is not translated.

# System action

The program continues.

#### User response

See z/OS UNIX System Services Command Reference for more information.

**FSUM7173** 

command: out of memory for link tables

# **Explanation**

There were not enough free system resources to create the needed link tables. When archiving files with multiple links, each link must be remembered.

#### User response

Archive in smaller pieces.

FSUM7174 command: missing num link(s) to filename

### **Explanation**

Not all links to a given file were archived.

### **User response**

None.

**FSUM7175** 

Missing file characteristics after "p"

## **Explanation**

You specified the **-p** option without providing an argument that indicated the file characteristics to be preserved.

## **User response**

Provide the missing argument.

**FSUM7176** 

Missing blocking factor after "b"

### **Explanation**

You specified the **-b** option without providing an argument that indicated the size of an output block.

## **User response**

Provide the missing block size.

**FSUM7177** 

Missing filename after "f"

# **Explanation**

You specified the **-f** option without providing a file name as an argument.

### **User response**

Provide the missing file name.

**FSUM7178** 

Missing substitution after "s"

#### **Explanation**

You specified the -s option without providing a substitution command as an argument.

# **User response**

Provide the missing substitution command.

**FSUM7179** 

Missing format after "x"

#### **Explanation**

You specified the -x option without providing an archive format as its argument.

### **User response**

Provide the missing archive format.

**FSUM7180** 

Missing volume pattern after "V"

### **Explanation**

You specified the -V option without providing a volume pattern as an argument.

Provide the missing volume pattern.

**FSUM7181** 

Missing keyword list after "o"

### **Explanation**

You specified the -o option without providing a keyword list as an argument.

### **User response**

Provide the missing keyword list.

FSUM7182

Unable to convert from codeset "codeset1" to codeset "codeset2"

# **Explanation**

The host file name character set ( codeset1 ) was unable to map to and from the archive character set ( codeset2 ).

#### **User response**

Correctly specify to and from keywords with the -o option of pax.

FSUM7183

command: cannot read archive from terminal

### **Explanation**

You attempted to extract or list an archive from a tty device.

#### **User response**

Specify a non-tty file name to pax.

**FSUM7184** 

command: can't use -a or -u with stdout

#### **Explanation**

You specified the  $-\mathbf{a}$  or  $-\mathbf{u}$  option when sending output to the standard output. These options can only be used with archive files.

### **User response**

Make sure that you specify an archive file when using the **-a** or **-u** options.

**FSUM7185** 

command: blocking factor must be at least 512 for read operations

#### **Explanation**

You specified a blocking factor of less than 512 bytes and attempted to perform read operations.

#### **User response**

Use the **-b** option to specify a block size of at least 512 bytes.

FSUM7194

command: badly formed number: "string"

### **Explanation**

You specified an invalid number as the argument of a **-b** option.

### **User response**

Specify a valid number.

**FSUM7195** 

command: overflow in blocking factor: "string"

## **Explanation**

You specified a *blocksize* argument to the **-b** option that was too large.

### **User response**

Use a smaller value for blocksize.

**FSUM7196** 

command: blocking factor of 0 not allowed

## **Explanation**

You specified the **-b** option with an argument that evaluated to zero.

## **User response**

Specify a nonzero value as the argument to the **-b** option.

**FSUM7197** 

command: invalid archive format selected: 'string'

#### **Explanation**

You specified an argument to the -x option that is not a supported format.

# **User response**

Check the description of pax in <u>z/OS UNIX System Services Command Reference</u> for a list of supported archive formats.

FSUM7199

command: medium not seekable

### **Explanation**

You attempted to append to an archive which was not seekable.

#### User response

Create a new archive instead.

**FSUM7200** 

command: pathname: Not a directory

## **Explanation**

You specified pass mode with either the  $-\mathbf{p}$  option for cpio or the  $-\mathbf{r}$  and  $-\mathbf{w}$  options for pax, but the destination given was not a directory.

#### **User response**

Make sure that the destination *pathname* is a directory.

FSUM7203

command: error in string replacement: string

## **Explanation**

An error occurred while string placement was being performed during regular expression processing.

**564** z/OS: z/OS UNIX System Services Messages and Codes

## **System action**

The command ends.

#### **User response**

Verify that the regular expressions used are correct and reissue the command.

FSUM7204

Warning: blocking factor blocksize not portable to UNIX

### **Explanation**

You specified a blocking factor ( *blocksize* ) that was larger than 20. This may create an archive that does not work on a UNIX system.

### **User response**

To guarantee portability to a UNIX system, use a *blocksize* of 20 or less. A larger value may work but is not guaranteed.

**FSUM7205** 

TAR file already set

## **Explanation**

You specified the **f** option more than once on the command line.

## **User response**

Specify the **f** option only once.

**FSUM7206** 

Must specify one of 'c', 'r', 't', 'u', or 'x'

### **Explanation**

tar requires that you specify one of the **c**, **r**, **t**, **u**, or **x** options as the first character of its option string. You failed to do this.

#### User response

Specify one of the required options at the beginning of the option string.

FSUM7207

command: "z" (compress) option unavailable with "option"

#### **Explanation**

The compress option cannot be specified with the "r" (replace) option; compressed archives cannot be appended to.

# **System action**

The program ends.

#### **User response**

To add a file to the end of a compressed archive, you can first use the *uncompress* utility to uncompress the archive, and later use the *compress* utility to recompress the archive.

**FSUM7209** 

command: tape archive medium not seekable

### **Explanation**

You attempted to use the replace  $(\mathbf{r})$  option on an archive file that was not seekable.

### **User response**

Only use the  $\mathbf{r}$  option with archive files that are seekable.

FSUM7210

command: 'u' function not implemented--using 'r'

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7211** 

chdir to pathname

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7218** 

command: string: name too long

## **Explanation**

The path name *filename* was too long to be included in a tar archive.

# **User response**

Rename or move *filename*, such that its path name is shorter.

**FSUM7219** 

command: string: Unknown mode filename

# **Explanation**

The type of the file specified in the *mode* field of the tar archive entry is not supported by the operating system.

# **User response**

No action possible, as the file cannot exist on the host system.

**FSUM7220** 

command: string is a special file--not dumped

### **Explanation**

You attempted to dump a special file *filename* when writing a non-USTAR tar file.

# User response

Do not specify special files to be included in tar archives. If you want to archive special files, use a USTAR format archive.

**FSUM7221** 

command: file "hardlink": hard link to "targetfile" ignored: tar format does not permit links to pathnames longer than n

# **Explanation**

The format of the tar and USTAR archives does not allow the storing of files that are hardlinked to files whose name exceeds n characters. Hard links are files that have the same inode value. The first file stored in the archive with the same inode as subsequently archived hardlinks is considered the target of those subsequently archived hardlinks. The name of the target hard link cannot exceed n characters, because the format of the archive only allows for n characters to represent the name of the target hardlink.

## System action

The program continues.

### **User response**

For z/OS Release 9 or later, pax and tar support an extended USTAT format, which can store hard links whose target exceeds *n* characters. See *z/OS UNIX System Services Command Reference* for more information. For previous versions, the hardlink cannot be stored unless the name of the target hardlink is shortened. For pax, the -i or -s options can be used to rename files.

**FSUM7222** 

command: symbolic link "symlink": tar format does not permit symbolic links to pathnames longer than n

### **Explanation**

The format of the tar and USTAR archives does not allow the storing of symbolic links whose target pathname exceeds *n* characters.

# System action

The program continues.

### **User response**

For z/OS Release 9 or later, pax and tar support an extended USTAT format, which can store symbolic links whose target exceeds *n* characters. See *z/OS UNIX System Services Command Reference* for more information.

**FSUM7223** 

tape read

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7224** 

Incomplete tape block

### **Explanation**

When reading a tape archive header, a block that was not the same size as the archive block size was read.

#### **User response**

Check to see if the archive was corrupted.

**FSUM7226** 

command: filename: name too long...switching to USTAR format

### **Explanation**

The pax or tar command was using the original UNIX tar format when it encountered *filename*, whose name was too long to be represented in the archive using the original UNIX tar format. It switched to the USTAR format for the remainder of the archive.

# **System action**

The program continues.

This is an informational message. No corruption occurred to the archive or to *filename*, and no recovery action is required. To avoid this message, use the "-U" option for tar, to force the use of the USTAR format. For pax, do not use "-x" to specify the tar format; pax will use USTAR as the default.

**FSUM7229** 

scratch file

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7230** 

sorting

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7231** 

updating archive

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7252

Badly constructed regular expression.

## **Explanation**

You specified an incorrect regular expression.

### **User response**

Correct the regular expression.

**FSUM7253** 

No remembered regular expression.

### **Explanation**

You attempted to use the /, ?, or ^ command to repeat a previous search; however, no previous search command identified a regular expression to search for.

#### **User response**

Explicitly specify the regular expression for which you want to search.

**FSUM7257** 

Missing prompt after -p

# **Explanation**

You specified the **-p** option without providing a prompt string as its argument.

#### User response

Provide the missing prompt string.

FSUM7259

Terminfo database not found

# **Explanation**

The terminfo database could not be found.

Set the environment variable TERMINFO to point at a valid database of terminal information.

**FSUM7260** 

term: Unknown terminal type.

### **Explanation**

The terminal type *term* could not be found in the terminal database.

### **User response**

Check that the TERM environment variable is set correctly.

**FSUM7261** 

term: Unknown terminal type, using dumb.

### **Explanation**

The terminal type term could not be found in the terminal database. The terminal type was set to dumb.

## **User response**

Check that the TERM environment variable is set correctly.

**FSUM7263** 

insufficient memory

### **Explanation**

There were not enough free system resources to perform the requested operation.

### **User response**

Free up more system resources.

FSUM7266

Width is insufficient

## **Explanation**

The line was not wide enough to hold the given number of columns with the given column width; or a column was not wide enough to hold the minimum amount of data.

### **User response**

Use the **-w** option to increase the width of the page.

FSUM7267

Too many files for merge(-m) option; limit num

## **Explanation**

You specified too many files for the **-m** option to handle. The limit was *num* files.

#### **User response**

Specify fewer files.

**FSUM7280** 

rm: not allowed to remove pathname

#### **Explanation**

You specified either . (current directory) or . . (parent directory) as the final pathname component of *pathname*. rm will not remove these directories.

### **System action**

Processing for the pathname is skipped, the command continues.

### **User response**

Do not specify . or . . as the final pathname component of *pathname*.

FSUM7282

rm: use "-r" to remove directory "pathname"

## **Explanation**

You attempted to use rm to remove a directory without specifying the **-r** option.

## **User response**

Specify the **-r** option when you want to use rm to remove a directory.

**FSUM7283** 

rm: fatal error during "-r" option

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7286** 

cannot stat entry "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7287** 

cannot open directory "pathname"

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7290

insufficient memory for buffers

# **Explanation**

There were not enough free system resources to allocate as buffers.

#### **User response**

Free up more resources.

FSUM7291

"y" command may not be followed by a newline

# **Explanation**

You followed the  $\mathbf{y}$  command with a newline rather than its required arguments.

## **User response**

Provide the missing arguments.

**FSUM7293** 

non-matching "{" and "}" commands

### **Explanation**

You specified a { command without the matching }.

**570** z/OS: z/OS UNIX System Services Messages and Codes

Provide the missing }.

FSUM7294

garbage after command

## **Explanation**

You specified invalid characters after a script command.

## **User response**

Remove the surplus characters.

FSUM7295

number addresses given for command expecting at most maximum number

## **Explanation**

You specified a command with *number* addresses that uses a maximum of *maximum\_number* addresses.

#### **User response**

Use the correct number of addresses.

**FSUM7296** 

newline or end of file found in pattern

### **Explanation**

sed encountered a newline or end-of-file character when reading a pattern from the script or script file.

### **User response**

Check the pattern for a missing delimiter.

**FSUM7297** 

Missing script

#### **Explanation**

You specified the **-e** option but did not provide a script as its argument.

### **User response**

Provide the missing script.

FSUM7299

label "label" not found in script

## **Explanation**

You specified *label* as an argument to the **b** or **t** command, but *label* does not exist in the script.

## **User response**

Make sure that **b** and **t** commands refer to labels that exist in the script.

**FSUM7300** 

cannot nest "!" command

### **Explanation**

You attempted to execute one! command from within another.

### **User response**

Remove any nested! commands.

FSUM7301

"\" must terminate the "character" command

## **Explanation**

You specified the cmd command, but you did not provide the backslash (\) required to terminate its input.

## **User response**

Provide the missing \.

FSUM7302

End of file in "cmd" command

### **Explanation**

sed encountered an end of file while parsing the command cmd.

## **User response**

Check the script file for missing closing quotes, missing regular expression delimiters, and other syntactical errors.

FSUM7303

"cmd" command needs a label

### **Explanation**

You specified a command that requires a label as an argument, but you did not provide the label name.

#### **User response**

Provide the missing label name.

**FSUM7305** 

no memory file file table

#### **Explanation**

There were not enough free system resources to perform the requested operation.

#### User response

Free up more resources.

**FSUM7306** 

badly formed file name for "cmd" command

## **Explanation**

You specified the *cmd* which requires a file name as an argument, but the given argument does not have the syntax of a file name.

#### **User response**

Specify a valid file name.

**FSUM7308** 

insufficient memory to compile command

## **Explanation**

There were not enough free system resources for sed to compile a given command.

**572** z/OS: z/OS UNIX System Services Messages and Codes

Free up more resources.

**FSUM7309** 

bad regular expression delimiter after \

# **Explanation**

You used a backslash (\) to indicate an alternate regular expression delimiter, but you did not follow it with a valid delimiter.

## **User response**

Provide a valid delimiter following the \ (that is, any character other than newline, space, tab, or EOF).

**FSUM7310** 

no remembered regular expression

# **Explanation**

You issued a command that tried to use a remembered regular expression, but there was no remembered regular expression.

### **User response**

Specify the regular expression explicitly.

**FSUM7311** 

script file "filename"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7315** 

string: restricted

### **Explanation**

You were using the restricted version of the shell (for example, by specifying the  $-\mathbf{r}$  option for sh). The restricted shell does not allow the use of the specified command.

#### **User response**

To use the specified command, you must be using a non-restricted shell.

**FSUM7316** 

string: readonly variable

## **Explanation**

You attempted to change or remove the variable name which was marked as read-only.

#### **User response**

Do not attempt to change or remove a read-only variable.

**FSUM7317** 

temporary file (filename) error using here document

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7318** 

cannot open script "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7320

missing command after -c

# **Explanation**

You specified the **-c** option but did not provide a command as an argument.

## **User response**

Provide the missing command.

**FSUM7321** 

Unknown option "option"

### **Explanation**

You specified an option that is not valid for this command.

## **User response**

Check z/OS UNIX System Services Command Reference for a list of options.

**FSUM7325** 

return: not executing function

# **Explanation**

You specified a return command when you were not executing a function.

# **User response**

Only use return to return from a function.

**FSUM7326** 

reading script

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7327** 

signal number num not conventional

### **Explanation**

You specified a signal number *num* which is not conventional. The signal associated with the signal number is not the same across all platforms. The signal number *num* defined by this system will be used by the command.

# **System action**

The command continues. This message does not affect the exit status.

### **User response**

To avoid this message, specify the desired signal name.

FSUM7328	too many outstanding signals

FSUM7329 <(command) and >(command) not implemented

You attempted to use <(command) or >(command) which are not implemented in this version of the shell.

#### **User response**

Do not use these constructs.

FSUM7330

<<string unclosed

## **Explanation**

The shell encountered an end-of-file character while reading a here document before it encountered name.

### User response

Make sure that *name* appears in the text of the input file.

**FSUM7331** 

too many << in line

### **Explanation**

You specified more than 10 here documents using <<.

#### **User response**

Simplify your command line to use fewer here documents.

**FSUM7332** 

syntax error: got string1 expecting string2

# **Explanation**

When processing your input, the shell encountered string1 when it was expecting string2.

### **User response**

Check the description of sh in z/OS UNIX System Services Command Reference for the correct syntax for various shell commands. Reenter your input with the correct syntax.

**FSUM7333** 

Use "exit"

# **Explanation**

You entered an end-of-file (EOF) character (Ctrl-D), but the ignoreeof shell option is set. The ignoreeof option tells the shell not to exit when an EOF character is entered.

## **System action**

The shell continues.

#### **User response**

Enter the exit command to exit the shell.

**FSUM7334** 

not an identifier

# **Explanation**

You specified a for, function, or select statement, but did not follow it with a valid identifier.

### **User response**

Provide a valid identifier after the statement.

#### **FSUM7337**

#### coprocess not implemented

## **Explanation**

On DOS, you attempted to use an operation or option that depends on coprocesses. DOS does not support coprocesses.

## **User response**

Do not attempt to use coprocesses on DOS.

**FSUM7338** 

execute: internal error (number)

# **Explanation**

This is an internal error in the z/OS shell.

# **System action**

The command ends.

### **User response**

Report this error to IBM Service.

**FSUM7339** 

ambiguous redirection

## **Explanation**

You specified a file name in a redirection construct that expands to other than a single word.

#### **User response**

Ensure that the file name in a redirection construct expands to a single word.

**FSUM7340** 

file descriptor fd already redirected

## **Explanation**

You attempted to redirect the file descriptor fd which was already being redirected in the same command.

#### User response

Only redirect a file descriptor once.

FSUM7341

bad file descriptor "fd"

# **Explanation**

You tried to read from, or write to, the file descriptor fd which was not open for that operation.

### **User response**

Open the file descriptor fd for the appropriate operation.

**FSUM7342** 

file "filename" already exists

You attempted to redirect output into an existing file, but you have turned on the **noclobber** option (see set 1).

### **User response**

Use the construct > | filename to redirect the output into an existing file or turn the **noclobber** option off with set+o noclobber.

**FSUM7343** 

cannot open "filename" for input/output

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7345** 

no file descriptor available

# **Explanation**

You attempted to redirect a file descriptor but none were available. When a file descriptor is redirected, the old value is remembered by the shell by duplicating it to yet another file descriptor. The total number of file descriptors is limited by the system and hence the shell may run out while it looks like your command is using far fewer than the maximum number of descriptors.

#### **User response**

Free up a file descriptor.

**FSUM7346** 

no pipes available

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7347** 

cannot open "filename"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7349** 

only one co-process allowed

### **Explanation**

You tried to create more than one coprocess.

## **User response**

Do not attempt to create more than one coprocess.

FSUM7350

e\_cmd: negative result?

## **Explanation**

This is an internal error in the z/OS shell.

# **System action**

The command ends.

### **User response**

Report this error to IBM Service.

FSUM7351

not found

## **Explanation**

You attempted to execute a command that could not be found.

## **User response**

Ensure that the command exists and that the PATH environment variable is valid.

**FSUM7352** 

recursion too deep

### **Explanation**

You have defined a function that has too many levels of recursion.

## **User response**

Simplify the function to use fewer levels of recursion.

**FSUM7354** 

"string" is not an identifier

### **Explanation**

You attempted to use an nonalphanumeric *name* as an identifier.

# **User response**

Use only alphanumeric names for identifiers.

**FSUM7355** 

bad file descriptor "fd"

### **Explanation**

You tried to read from, or write to, the file descriptor fd which was not open for that operation.

## **User response**

Open the file descriptor fd for the appropriate operation.

**FSUM7356** 

history not available

#### **Explanation**

The shell was unable to open a history file when you logged in.

### **User response**

Make sure that the environment variable HISTFILE is set to a file which is named properly and for which you have appropriate permissions. You may have to log in again.

**FSUM7357** 

no active co-process

# **Explanation**

You attempted to receive input from or send output to a coprocess when there was no active coprocess.

Do not use the **-p** option when there is no active coprocess.

**FSUM7358** 

no HOME directory

# **Explanation**

You attempted to use cd to return to your home directory; however, the environment variable HOME was not defined.

## **User response**

Set the environment variable HOME to the path name of your home directory.

**FSUM7359** 

no previous directory

# **Explanation**

You tried to use the command cd – to return to your previous working directory; however, there was no record of what your previous directory was.

### **User response**

Specify the desired directory explicitly.

**FSUM7360** 

pattern "old" not found in "dir"

## **Explanation**

You tried a command of the form cdold new. However, the name of the current directory dir does not contain any string matching the regular expression old.

### **User response**

Ensure that the name of the current directory contains the regular expression old.

**FSUM7362** 

writing

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7363** 

reading

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7364** 

bad shift count expr

#### **Explanation**

You specified an expression that did not evaluate to a number in the range from 0 to the number of remaining positional parameters.

#### **User response**

Specify an expression that evaluates to a number in the range from 0 to the number of remaining positional parameters.

#### **FSUM7366**

"string" not a valid trap name

# **Explanation**

You specified an unrecognized trap name.

### **User response**

Check that you spelled the trap name correctly.

**FSUM7367** 

base "number" not in [2,36]

## **Explanation**

You used the **-i** option to specify a base for an integer, but the base was not in the range from 2 to 36.

## **User response**

Specify a base in the range from 2 to 36.

**FSUM7369** 

**Cannot restore privileged state** 

### **Explanation**

You specified **+o privileged** or **-p**, but for some reason, the shell cannot restore the affected values.

### **User response**

Exit the current shell and start a new one.

FSUM7411

cannot create temporary file

## **Explanation**

A temporary file was required to perform the requested operations. The shell was unable to create this file, for example, because the disk was full.

### **User response**

Free up more disk space.

FSUM7412

no command matches "command"

## **Explanation**

You asked to edit a command beginning with a particular *string*, but there was no such command in the history file.

#### **User response**

Use the fc command to browse through the history file to ensure that string is entered correctly.

FSUM7421

command is corrupt

# **Explanation**

An internal error occurred in the z/OS shell while it was searching for the command.

_			. •
SW	ctan	n ar	tion
Jγ	sten	ıı ac	LIVI

The command ends.

### **User response**

Report this error to IBM Service.

FSUM7422

name is not found

## **Explanation**

You specified a *name* that type was unable to find.

## **User response**

Check that the *name* exists, was spelled properly, and that you have the appropriate permissions.

FSUM7423

stack overflow

# **Explanation**

You specified an expression that was too complicated for the stack to handle.

## **User response**

Try simplifying the expression.

**FSUM7424** 

misplaced subscript

# **Explanation**

The subscript for an array was missing or invalid.

### **User response**

Make sure that you provide a valid subscript for the array.

**FSUM7425** 

unknown operator

# **Explanation**

You specified an unknown operator.

### **User response**

Check the *Arithmetic Substitution* subsection of the description of sh in <u>z/OS UNIX System Services Command</u> Reference for a table showing the valid arithmetic operators.

**FSUM7426** 

base must be in [2,36]

# **Explanation**

You specified a base that was not in the range 2 to 36.

### **User response**

Specify a base in the 2 to 36 range.

**FSUM7427** 

unmatched?:

## **Explanation**

You specified the? operator without the:.

## **User response**

Specify the missing:.

FSUM7428 expression: internal error

## **Explanation**

This is an internal error in the z/OS shell.

# **System action**

The command ends.

### **User response**

Report this error to IBM Service.

FSUM7429

assign only to variable

## **Explanation**

You specified an assignment where the left hand side that was not a variable.

### **User response**

Only use the assignment operators to assign values to variables.

**FSUM7430** 

error in arithmetic expression "expr"

### **Explanation**

An error occurred in the arithmetic expression expr.

### **User response**

Look up *error* in the error listing for more details.

**FSUM7431** 

error in arithmetic expression "expr" near substr

### **Explanation**

An error occurred in the arithmetic expression *expr* near the substring *substr*.

## **User response**

Look up error in the error listing for more details.

**FSUM7433** 

string: No such job

## **Explanation**

You specified a nonexistent job identifier.

Use the **jobs** command to get a list of jobs that are currently job controlled.

**FSUM7438** 

iob control disabled

# **Explanation**

You attempted to use the **fg** or **bg** command when **set** -o monitor (or **set** -m was not set.

### **User response**

Turn on monitor mode with **set** -omonitor or **set**-m. This mode is not supported on all systems.

**FSUM7439** 

job [job-id] not job controlled

### **Explanation**

You specified the job identifier of a job which was not being job controlled.

## **User response**

Use the jobs command to get a list of jobs currently being job controlled.

**FSUM7440** 

cannot continue job

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7441

"string" not a valid signal

### **Explanation**

You specified a non-integer signal for **kill** that was not a valid signal name, or you specified a signal that is outside the range of valid signal numbers.

#### **User response**

Make sure that you specify a valid signal number or name for signal.

**FSUM7442** 

"string" is not a job

## **Explanation**

You specified a job-identifier that is not valid, or a PID (process ID) that is not valid. One example of an invalid PID is a number greater than 2147483647.

### **User response**

Specify a valid job-identifier or PID.

**FSUM7443** 

j\_freejob(NULL)!

### **Explanation**

An internal function in the z/OS UNIX shell was invoked with a NULL input parameter. If this occurred after a prior failure, it is normal and may be ignored.

## **System action**

The command ends. The shell continues.

#### **User response**

If this occurs repeatedly, or without a prior failure, follow local procedures for reporting problems to IBM.

**FSUM7449** 

pathname: Unknown file type field value 'type'

### **Explanation**

A file with an invalid file type was encountered when extracting or listing an archive's contents.

### User response

This archive is invalid. No action is possible.

**FSUM7452** 

string: Pathname component too long

# **Explanation**

You specified a *directory* with a name that was longer than the maximum length indicated by the configuration variable \\*[VARX PATH\_MAX]. The specified *directory* is invalid, since no directory can exist with a path name that long.

## **User response**

Specify a valid directory.

**FSUM7453** 

Argument to -n must be numeric

### **Explanation**

You specified an argument to the -n option that was not a number.

#### **User response**

Specify a numeric argument for -n.

**FSUM7455** 

command name: warning--file size error in "filename"--file truncated

# **Explanation**

While *filename* was being written to the archive, the size of the file grew. Only the amount of the file that corresponds to the original size of *filename* was archived; the contents of *filename* in the archive no longer match the contents of *filename* on your file system.

# **System action**

The program continues.

#### **User response**

If the truncation of *filename* is a problem, rebuild the archive.

**FSUM7456** 

command name : warning--file size error in " filename "--file padded with spaces

While *filename* was being written to the archive, another unrelated application caused the size of the file to become smaller. *filename* was stored in the archive padded with spaces to its original size, and the contents of *filename* in the archive no longer match the contents of *filename* on your file system.

# **System action**

The program continues.

### **User response**

If the padding of *filename* is a problem, rebuild the archive.

**FSUM7457** 

Checksum error on tape (got hexnum1 expected hexnum2)

## **Explanation**

A bad checksum was found in a tar header.

### User response

Check to see if the archive was corrupted.

**FSUM7458** 

command: non-USTAR header in USTAR archive at "string"

### **Explanation**

When reading a USTAR format archive, pax encountered a header without the USTAR magic number.

## User response

Check to see if your archive has been corrupted.

**FSUM7459** 

string: Component `directory' makes pathname too long.

### **Explanation**

The *name* component of the specified path name makes the overall path name longer than the maximum length indicated by the configuration variable PATH\_MAX.

#### **User response**

Use **cd** to move deeper into the directory structure and try **1c** again. This should result in a shorter overall path name.

FSUM7460

string: try "c" option for ASCII archive

### **Explanation**

The magic number in the **cpio** archive header appeared to be in ASCII.

#### **User response**

Try using the -x **cpio** option instead of -x **cpiob**.

**FSUM7461** 

command: string: final component of name too long

The USTAR format extends the old **tar** file name limit from 100 to 256 bytes; however, this requires breaking up the file name into one piece of 156 bytes or less and another piece of 100 bytes or less. The break occurs between directory components (that is, at a slash). In the case of *pathname*, the second component could not be made to fit into 100 bytes.

## **User response**

Move or rename pathname to have shorter path components.

FSUM7462

command: string: Unable to split name to fit in tar header

# **Explanation**

The USTAR format extends the old **tar** file name limit from 100 to 256 bytes; however, this requires breaking up the file name into one piece of 156 bytes or less and another piece of 100 bytes or less. The break occurs between directory components (that is, at a slash). In this case, the characteristics of *pathname* would not allow it to be broken up in such a manner.

#### **User response**

Move or rename *pathname* to have shorter path components.

**FSUM7473** 

Missing variable assignment

# **Explanation**

You specified the -v option but did not follow it with a variable assignment.

## **User response**

Provide a variable assignment following the -v option.

**FSUM7475** 

command: username is not a member of group groupname

### **Explanation**

The user *username* is not included in the list of users who are members of the group *groupname*, and the group does not have a password or password phrase.

### **User response**

See your system programmer about adding username to the members of groupname.

**FSUM7476** 

-f filename invalid if message given

## **Explanation**

On the logger command line, you used the -f to indicate a file from which logger is to read log messages; however, you also provided the argument *string* to be used as a log message. You cannot use both methods on the same command line.

#### **User response**

Either specify a file to be read with the -f option or provide a log message on the command line, but not both.

**FSUM7477** 

Formatted log message too long -- limit LINE\_MAX (num)

The formatted log message was longer than *num* characters. *num* is the value of the configuration variable LINE\_MAX.

### **User response**

Shorten your log message.

FSUM7478	Warning: newgrp utility probably not setuid to root.
FSUM7483	bad file name in atjobs directory: "pathname"

## **Explanation**

A file in the atjobs directory was not of the form jobid]. queuename. No period (.) was found in the file name.

### **User response**

Have your system programmer remove the file.

**FSUM7488** 

files too large, trying "-h" option ...

### **Explanation**

You specified the -H option, but there were not enough free system resources to handle the files. **diff** will now try to compare the files using the -h option.

### **User response**

If you are comparing these two files again, specify the -h option on the command line for faster operation.

**FSUM7490** 

Missing field separator

### **Explanation**

You specified the -F option but did not follow it with a field separator.

#### User response

Provide a field separator following the -F option.

**FSUM7495** 

Security error: file "filename" owner is #user\_id1, should be #user\_id2

# **Explanation**

The user ID of the owner of a **crontab** file does not match the user ID in the user database corresponding to the name of the crontab file (which is the name of the user who should own it.

#### **User response**

Have your system programmer check the setuid and ownership (root) of the crontab program and remove the file.

FSUM7496 Security error: At job directory "pathname": bad owner/mode: cron exiting

## **Explanation**

An atjob file was found without root ownership, or it had other-writable permission.

Have your system programmer fix the ownership and/or permissions on the file, and check the setuid and ownership of the at program.

**FSUM7497** 

Security error: Crontab directory "pathname": bad owner/mode: cron exiting

### **Explanation**

A cron directory was found without root ownership, or it had other-writable permissions.

#### **User response**

Have your system programmer make root the owner of the directory and turn off the other-writable permission.

**FSUM7499** 

string: command: symbolic links not supported by OS

### **Explanation**

You attempted to extract a file specified as a symbolic link in the archive. Symbolic links are not supported on all operating systems.

## **User response**

Do not use symbolic links on this system.

FSUM7501

command: bad substitution expression: "sub\_pattern"

## **Explanation**

You invoked with a -s option, but the *sub\_pattern* argument was empty, or did not contain a leading delimiter.

#### User response

Specify a valid sub\_pattern argument, such as -s old/new.

FSUM7502

fifo special file "filename": fifo not supported by local o/s

### **Explanation**

You attempted to extract an archive file containing a FIFO file, and the host operating system does not support FIFOs.

#### **User response**

Since the operating system does not support FIFOs, no action is possible.

FSUM7506

Unknown tape density "num"

### **Explanation**

You specified a tape drive number followed by an argument that should be a tape density, but the argument was not 1, m, or h.

#### **User response**

Specify a valid tape density (1, m, or h).

FSUM7507

Missing file name after "f"

You specified the f option but you did not specify the name of an archive file as its argument.

### **User response**

Provide the missing file name.

FSUM7509

Missing blocking factor after "b"

### **Explanation**

You specified the -b option without providing an argument that indicated the size of an output block.

# **User response**

Provide the missing block size.

FSUM7513

Blocking factor "blocksize" is non-numeric

### **Explanation**

You specified the -b option, but the *blocksize* argument was not a valid number.

## **User response**

Specify a valid number as the value of blocksize.

FSUM7514

Blocking factor larger than number

## **Explanation**

You specified the -b option, but the blocksize argument that you provided is too large.

#### **User response**

Use a smaller blocksize.

**FSUM7517** 

command: -O: Must specify -o option

## **Explanation**

You specified the -0 option, but did not specify the -o option.

#### **User response**

To use the -0 option, you must specify the -o option.

FSUM7520

command: -I: Must specify -i option

# **Explanation**

You specified the -I option, but did not specify the -i option.

### **User response**

To use the -I option, you must specify the -i option.

FSUM7522

command: missing directory after -C

You specified the -C but did not provide a directory name as an argument.

### **User response**

Provide the missing directory name.

FSUM7524

Only one character allowed after -t

## **Explanation**

You specified a field separator that was longer than one character as an argument to the -t option.

## **User response**

Use a one-character field separator.

**FSUM7530** 

string: command: msg\_file: message must have id in range [1..line]

# **Explanation**

You specified a message identifier outside the valid range.

# User response

See the DESCRIPTION section of the **gencat** man page and \\*[INCL nls.h] for the valid range for message identifiers.

FSUM7531

writing to name

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7532** 

string: command: msg\_file: missing set identifier

### **Explanation**

You omitted the set-id from a \$set directive.

### User response

See the DESCRIPTION section of the gencat man page for the format of the \$set directive.

**FSUM7533** 

string: command: msg\_file: set id must be in range [1..line]

## **Explanation**

You specified a set identifier outside the valid range.

### User response

See the DESCRIPTION section of the **gencat** man page and \\*[INCL nls.h] for the valid range for set identifiers.

**FSUM7534** 

string: command: msg\_file: EOF in string

### **Explanation**

End of file was encountered in a message text string.

See the DESCRIPTION section of the **gencat** man page for the format of text message.

**FSUM7535** 

string: command: msg\_file: unterminated string

# **Explanation**

An unescaped newline was encountered in a quoted message text string.

## **User response**

See the DESCRIPTION section of the gencat man page for the format of text message.

**FSUM7536** 

string: command: msg\_file: EOF in string escape

### **Explanation**

End of file was encountered in an escape sequence in a message text string.

## **User response**

See the DESCRIPTION section of the **gencat** man page for the format of text message.

**FSUM7538** 

growing set index

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7539

initializing new set

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7540

growing message index

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7542** 

copying text to catalog

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7543

exitializing set index

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7544** 

getting index indirector

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7545** 

writing index to catalog

A system error indicating the cause is displayed with this message.

**FSUM7546** 

allocating set index

## **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7547 <state num1, i = num2 >

FSUM7548 Token buffer overflow

## **Explanation**

Your scanner contained a token that was larger than the token buffer.

### **User response**

Increase the size of the token buffer by editing yylex.c and increasing the size of YYLMAX, then recompile your scanner.

FSUM7552

Push-back buffer overflow

# **Explanation**

Your scanner action code called the unput function too many times in a row, causing the pushback buffer to overflow.

### User response

Increase the size of the pushback by editing yylex.c and increasing the size of YYLMAX, then recompile your scanner.

FSUM7553

seeking index in catalog

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7554** 

reading index from catalog

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7558** 

creating temp file name

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7559** 

allocating index

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM7560

initializing set index

A system error indicating the cause is displayed with this message.

**FSUM7561** 

opening catalog

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7562** 

creating temp file name

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7679** 

getcwd

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7723** 

-- core dumped

## **Explanation**

A program called by the shell terminated with a core dump.

## **User response**

Ensure that the program was called correctly.

**FSUM7725** 

history

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7726** 

cannot fork: reason code = reasoncode

# **Explanation**

A system error indicating the cause is displayed with this message.

### System programmer response

Take appropriate action based on reason code.

**FSUM7727** 

shell metacharacter in wordexp()

## **Explanation**

The wordexp function was called by the shell to expand a string that contained special shell characters.

### **User response**

Check the program which calls wordexp and ensure that the string to be expanded does not contain any special shell characters.

**FSUM7728** 

bad \${} modifier

You specified an invalid modifier in a \${} construct.

#### **User response**

Check the description of sh in z/OS UNIX System Services Command Reference for a list of valid modifiers in  $\{\}$  constructs.

**FSUM7729** 

missing closing "char"

## **Explanation**

You specified a  $\{$ , =,  $\setminus$ ',  $\hat{}$ , ", (, ( (, or [ and did not provide the corresponding closing character.

### **User response**

Provide the missing closing character.

**FSUM7730** 

string: no expansion of unset variables

## **Explanation**

You attempt to expand an unset variable when **set**-o nounset was on.

### **User response**

Use **set**+o nounset to turn nounset off and retry the expansion.

**FSUM7731** 

string: cannot assign

# **Explanation**

You attempted to use the special parameter @ or \* either as part of the undefined variable name in the construct \${name=word} or as part of the empty or undefined variable name in the construct \${name:=word}.

#### **User response**

Do not use the special parameters @ and \* as part of name when using these two constructs.

**FSUM7732** 

string: parameter null or not set

# **Explanation**

You specified a \${ name?} construct where name was not set and no message followed the ?.

#### User response

Set name and specify a message after the ?.

**FSUM7733** 

no command substitution permitted

### **Explanation**

The wordexp function was called by the shell to expand a string that contained command substitution, such as \$(cmd) or f(CW'cmd').

Check the program that called wordexp and ensure that the string to be expanded does not contain any command substitutions.

FSUM7734 substitute: internal error

## **Explanation**

An internal error occurred in the z/OS UNIX shell word substitution function.

## System action

The command ends. The shell continues.

### User response

Follow local procedures for reporting problems to IBM.

**FSUM7739** 

Illegal instruction

## **Explanation**

The shell received an illegal instruction signal. This signal typically occurs when a process tries to execute something that is not a valid machine instruction recognized by the hardware.

## **User response**

Contact your system programmer.

**FSUM7766** 

unbalanced[]

### **Explanation**

You specified a [ without providing the matching ].

#### **User response**

Provide the missing ].

**FSUM7767** 

missing closing)

### **Explanation**

You specified a (as part of the test expression but did not provide the closing).

#### User response

Provide the missing).

**FSUM7768** 

Not a Shell Regular Built-in Utility

#### **Explanation**

You attempted to execute a command that is not a regular built-in utility.

#### User response

Specify only shell regular built-in utilities.

**FSUM7769** 

Not enough memory

### **Explanation**

There were not enough free system resources to perform the requested operation.

#### **User response**

Free up more resources.

FSUM7770

Too many arguments

# **Explanation**

The system limit for the size of an argument list was exceeded.

## **User response**

Specify fewer arguments.

**FSUM7771** 

execl failed

### **Explanation**

The shell could not be executed to run a built-in shell utility.

### **User response**

Have your system programmer ensure that the shell is both accessible and executable.

**FSUM7778** 

Missing -o file

# **Explanation**

You specified the **-o** option without providing a file name as an argument.

### **User response**

Provide the missing file name.

FSUM7780

-position "string" must follow +position

# **Explanation**

You specified a - endpos option either before or without a +startpos option.

### **User response**

Reverse the order of the – and + options on the command line, or provide the missing +startpos option.

**FSUM7828** 

Missing tab list after -t.

# **Explanation**

You specified the **-t** option but did not provide a tab list as its argument.

### **User response**

Provide the missing tab list.

FSUM7829

Missing terminal type after -T.

You specified the -T option but did not provide a terminal type as its argument.

### **User response**

Provide the missing terminal type.

**FSUM7830** 

Illegal tabs in "tablist".

## **Explanation**

You specified a tablist which contained either a negative or nonnumeric value.

### User response

Specified a tablist that contains only numbers in ascending order.

**FSUM7831** 

Cannot set margins on terminal "term".

### **Explanation**

You specified the +m margin option, but the terminfo database does not support margins for the terminal term.

# User response

Check your terminal definition against the terminal's operation manual for missing information. If the terminal's manual does not provide the necessary information then your terminal does not support margins.

**FSUM7832** 

Cannot set tabs on terminal "term".

# **Explanation**

You attempted to set tab stops on the terminal *term*, but the terminfo database does not support tabs on that terminal.

#### **User response**

Check your terminal definition against the terminal's operation manual for missing information. If the terminal's manual does not provide the necessary information then your terminal does not support tabs.

**FSUM7833** 

"string" are not in ascending order.

### **Explanation**

You specified a list of tab stops that was not in ascending order.

#### User response

Specify the tab stops in ascending order.

**FSUM7835** 

not enough memory for buffering

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7836** 

re-opening file descriptor "fd"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7842** 

creating fifo "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7843** 

chowning fifo "filename"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7846** 

command: standard input must be a terminal.

# **Explanation**

You attempted to invoke talk when the standard input was not a terminal.

### **User response**

Set the standard input to be a terminal.

**FSUM7853** 

creating file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7854** 

opening file "filename"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7856** 

**Cannot fork** 

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM7859** 

**Bad date conversion** 

## **Explanation**

You specified an invalid date string on the command line.

#### User response

Specify a valid date string.

**FSUM7860** 

Only one -r (-f) or -t flag allowed

#### **Explanation**

You specified a -f, -r, or -t option on the same command line with one or more other -f, -r, or -t options.

Remove the excess options, leaving only one -f, -r, or -t option.

**FSUM7861** 

stat: age file "filename" inaccessible

## **Explanation**

You specified a *filename* that either does not exist, or one for which you do not have appropriate permissions.

#### **User response**

Check that *filename* exists, was named properly, and that you have appropriate permissions.

**FSUM7864** 

Unknown terminfo capability "action".

## **Explanation**

You specified a value for action that tput did not recognize as valid terminfo capability.

## **User response**

Check the Description section of the tput man page for a list of valid terminfo capabilities.

**FSUM7870** 

command: odd data

# **Explanation**

The input file contained an odd number of tokens.

## **User response**

Ensure that the input to tsort is valid, and try again.

**FSUM7876** 

Missing number of fields to skip

#### **Explanation**

You specified the -f option without providing the number of fields to skip as its argument.

#### User response

Provide the missing number of fields.

**FSUM7877** 

Missing character skip count

#### **Explanation**

You specified the -s option without providing the number of characters to skip as its argument.

### **User response**

Provide the missing number of characters.

**FSUM7878** 

skip not a number in "string"

### **Explanation**

You specified an argument to the +, -, -f, or -s option that was not a valid number.

#### **FSUM** messages

### **User response**

Specify a valid number.

FSUM7880

No begin line

## **Explanation**

uudecode did not find a begin line in the input file.

## **User response**

Make sure that the file was encoded by uuencode.

FSUM7881

Begin line missing filename

## **Explanation**

There was no file name specified on the begin line of the input file, most likely due to a corrupt file.

## **User response**

Get another copy of the encoded file.

**FSUM7882** 

No such user as "user"

### **Explanation**

You specified a file name that used tilde (~) expansion, but there no user with the given *username* exists on the local system.

## **User response**

Specify the file name without using tilde expansion, or specify a username that does exist.

**FSUM7883** 

No end line

#### **Explanation**

uudecode did not find a end line in the input file.

## **User response**

Make sure that the file has not been truncated.

**FSUM7884** 

Unable to set mode on "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

# **System action**

The command ends.

#### **User response**

Refer to the system error message and take appropriate action.

**FSUM7885** 

Short file

uudecode encountered an end-of-file character before encountering the end of the encoded text.

## **User response**

Make sure that the file has not been truncated.

FSUM7888

What? | command: No such command from open/visual

## **Explanation**

In **vi** mode, you attempted to use one of the **ex** commands that are not permitted in this mode.

### User response

Do not use command in vi mode.

FSUM7889

Can't undo within global.

# **Explanation**

You attempted to use an **undo** command within a global command. This is not permitted.

#### **User response**

Do not use an **undo** command within a global command.

**FSUM7890** 

missing lhs

# **Explanation**

You attempted to unmap or unabbreviate a mapping without providing the necessary left-hand-side.

### **User response**

Check the *Ex Commands* subsection of this man page for a description of the **unmap** and **unabbreviate** commands and their syntax.

**FSUM7894** 

ERROR: File is partially loaded due to too many lines. Editing in readonly mode.

### **Explanation**

vi has an upper limit for the number of lines in a file it can handle. The file the user is editing has surpassed that limit.

# **System action**

The program continues.

#### **System programmer response**

None.

#### **User response**

If the edits in the file need to be saved, use a different file name when writing out the file, as data loss may occur.

FSUM7895

Failed to preserve file.

vi attempted to write a recoverable version of the current working file to /etc/recover/\$LOGNAME, using the exrecover utility. It is possible that the exrecover command failed, or that the /etc/recover directory is not configured properly.

## **System action**

The program continues.

## System programmer response

Verify that the /etc/recover directory exists, and that it has proper permissions. Verify that /tmp (or wherever vi temporary files are currently being written) is not corrupted or full. For further assistance, follow local procedures for reporting a problem to IBM.

#### **User response**

To be sure you have a backup copy of your file, issue a :w alternatefilename to write out the current version of the file with this new (not existing) name. Contact your system programmer for further assistance.

**FSUM7897** 

Missing filename

## **Explanation**

You specified a command that required a file name as an argument without providing the file name.

## **User response**

Provide the missing file name.

**FSUM7898** 

System does not support job control

## **Explanation**

You attempted to use a job control command (for example, **stop**) on a system that does not support job control.

### User response

Avoid using commands that require job control. Request that the system manufacturer support job control.

**FSUM7899** 

Write forms are 'w' and 'w>>'

## **Explanation**

You specified an invalid syntax for the write command.

## User response

Check the Ex Commands subsection for a description of the write command and its syntax.

FSUM7901

Missing rhs

### **Explanation**

The right-hand-side expansion of a mapping is missing.

Provide the missing expansion to define a mapping or macro. Use the **unmap** command to remove a mapping or macro.

FSUM7903

No write since last change (:command! overrides)

## **Explanation**

You attempted to run a command before you saved any changes to a file.

## **User response**

Either save the current changes or use the suggested command to override the error.

FSUM7904

No file No current filename

# **Explanation**

You attempted to reread the current file when there was no current file.

## **User response**

Specify a file name with the command.

FSUM7905

Extra chars Extra characters at end of command

## **Explanation**

You specified extraneous characters at the end of the command line that have no function.

### **User response**

Reenter the command without the extraneous characters.

**FSUM7906** 

Not that many lines in buffer

#### **Explanation**

You specified a line range that included at least one value that was greater that the number of lines in the file.

## **User response**

Specify a correct line range. You can use the dollar sign (\$) to denote the last line in the file.

FSUM7907

Insufficient memory string

## **Explanation**

There were not enough free system resources to perform the requested operation.

## **User response**

Free up more resources.

**FSUM7908** 

Restricted environment

### **Explanation**

You tried to use an operation that is not permitted in a restricted environment.

Use an unrestricted version of the editor. Contact your system programmer if you do not have access to an unrestricted editor. Also, once the set variable restrict is enabled, it cannot be disabled during the editor session.

**FSUM7909** 

Negative address - first buffer line is 1

## **Explanation**

You specified a negative number as an address. The address of the first line of the buffer is 1.

## **User response**

Specify a positive number as an address.

**FSUM7910** 

**Unimplemented EX command** 

## **Explanation**

You attempted to use an Ex command that is not implemented on your system.

### **User response**

Do not use unimplemented commands.

FSUM7911

Global within global not allowed.

## **Explanation**

You specified either a  $\mathbf{g}$  or a  $\mathbf{v}$  as the command to be used with the  $\mathbf{e}\mathbf{x}$  global command. The global commands  $\mathbf{g}$  or  $\mathbf{v}$  cannot occur in the list of commands to run globally.

## System action

The program continues.

### **User response**

Verify that the command you entered has no errors, or attempt your action through another method. See z/OS UNIX System Services Command Reference for more information.

**FSUM7913** 

No address allowed on this command

#### **Explanation**

You specified an address for a command which does not use an address.

### **User response**

Reenter the command without the address.

**FSUM7915** 

Undefined mark referenced

### **Explanation**

You attempted to reference a mark which was not yet defined.

Define the mark using the m command.

#### **FSUM7918**

#### Addr1 > addr2 | First address exceeds second

## **Explanation**

You specified two addresses to indicate a range; however, the first address was greater than the second.

## **User response**

When specifying a range, make sure that the first address is less than the second.

FSUM7921

string: No such option@- 'set all' gives all option values

## **Explanation**

You attempted to reference an invalid set variable.

## **User response**

Check the Set Option Variables subsection for a list of valid variables, or use the set all command to see the current settings of all variables.

FSUM7922

String too long in option assignment

## **Explanation**

You attempted to assign a string to a variable using the **set** command, but the size of the string exceeded the allocated storage space.

#### **User response**

Specify a shorter string.

**FSUM7927** 

No File

## **Explanation**

You attempted to reread the current file when there was no current file.

#### **User response**

Specify a file name with the command.

**FSUM7929** 

Nothing in buffer 'buf'.

### **Explanation**

You attempted to use the **put** command to paste text, or the **@** command to execute a macro, from the buffer *buf* which was empty.

#### **User response**

Use the **yank** or **delete** commands to save text to a buffer.

FSUM7930

command: Text conversion cannot be performed between file CCSID file\_ccsid and program CCSID pgm\_ccsid for file. fcntl() failed with error number.

The command cannot convert text data between the specified CCSIDs, or a conversion path between the two CCSIDs does not exist.

## System programmer response

Follow local procedures for reporting a problem to IBM.

## **User response**

Correct the text conversion options specified and try the operation again. See the command documentation in *z/OS UNIX System Services Command Reference* for more information. See the fcntl() system call documentation in *z/OS C/C++ Runtime Library Reference* for more information about the error number. If the error persists, contact your system programmer.

#### FSUM7931

#### Replacement pattern too long - limit num characters

## **Explanation**

You specified a replacement pattern that was too long for the allotted buffer space.

## **User response**

Perform the necessary replacements in increments using shorter replacement patterns.

#### **FSUM7932**

### Regular expression too complicated

## **Explanation**

The regular expression specified by the user is too long.

### **System action**

The command continues.

## **User response**

Specify a shorter regular expression.

#### **FSUM7933**

#### Can't escape newline in visual

### **Explanation**

You attempted to use a backslash at the end of a line to escape a newline. This is not permitted in Vi mode.

### **User response**

Do not use a backslash at the end of a line.

### **FSUM7934**

#### command: Value "option" for -W is not supported

#### **Explanation**

The option format or keyword specified with the –W option is not supported or is not valid on this command.

#### User response

Correct the option value specified and try the operation again. For more information about the command, see *z/OS UNIX System Services Command Reference*.

**606** z/OS: z/OS UNIX System Services Messages and Codes

#### **FSUM7935**

#### No newlines in re's Can't escape newlines into regular expressions

## **Explanation**

You attempted to search for a newline character in a regular expression. This is not possible.

## **User response**

Do not attempt to search for a newline in a regular expression.

#### FSUM7936

#### **Command too long**

## **Explanation**

You entered a command line that exceeded the input buffer size.

## **User response**

Break the command line in smaller workable components. Create macros or source scripts if the task is going to be performed many times.

#### **FSUM7937**

### command where? | command requires a trailing address

# **Explanation**

You attempted to use *command* to move or copy a range of lines without specifying a target address.

## **User response**

Provide the missing target address.

#### **FSUM7938**

#### No filename to substitute for %

## **Explanation**

You attempted to use % to represent the current file name, but there was no current file name.

### **User response**

Specify a full file name for the command.

#### FSUM7939

#### No alternate filename to substitute for #

# **Explanation**

You attempted to use # to represent the alternate file name, but there was no alternate file name.

#### **User response**

Specify a full file name for the command.

#### FSUM7940

#### Filename too long

## **Explanation**

You specified a file name that exceeded the maximum length allowed.

### **User response**

Use a shorter name.

#### FSUM7941

#### Too many file names

## **Explanation**

You specified multiple file names as arguments to a command that only accepts one file name.

### **User response**

Check the Ex Commands subsection of the vi man page for a list of valid Ex commands and their arguments.

#### FSUM7942

#### **Argument buffer overflow**

# **Explanation**

You specified a list of command arguments that, after the expansion of the current file name (%) or the alternate file name (#), overflowed the buffer.

## User response

Specify a shorter list of command arguments.

#### **FSUM7943**

Incomplete shell escape command - use 'shell' to get a shell

## **Explanation**

You attempted to use a shell escape without specifying a command.

## **User response**

To invoke an interactive shell, use the **shell** command.

#### **FSUM7944**

Too long|Result of delete would produce a line too long

# **Explanation**

You attempted to delete a range of text from the middle of one line to the middle of another. This would result in joining the remainders of the lines to form a line, the length of which would exceed the maximum line length indicated by the configuration variable LINE\_MAX.

#### **User response**

Make shorter lines.

#### **FSUM7945**

Line too long

## **Explanation**

You attempted to add text to a line that would cause its length to exceed the maximum indicated by the configuration variable LINE\_MAX.

#### User response

Make shorter lines.

**FSUM7946** 

tagstring: Bad tag file entry

#### **Explanation**

vi encountered an entry in the tags file that it was unable to parse correctly.

See the man page for ctags 1 for information on how to generate a tags file, or ctags 4 for the correct format of a tags entry.

FSUM7949

Too many nested sources

## **Explanation**

You attempted to nest too many source files within other source files.

## **User response**

Reduce the level of nesting.

**FSUM7950** 

Temporary file i/o error--DANGER--write file somewhere else and exit ASAP!

## **Explanation**

A serious error occurred while performing I/O on the temporary files.

### **User response**

Save the work space to a different work file name, exit the editor and reenter using the recently saved work file. If the error persists, contact your system programmer.

FSUM7952

Internal error: bad seek pointer.

## **Explanation**

An internal error occurred while processing ed/vi internal buffers. No file damage has occurred, but ed/vi has lost track of where it is in the file.

### **User response**

Quit editing the current file, and restart the editor again. If the error persists, contact your system programmer.

FSUM7953

Internal error: bad write seek.

### **Explanation**

An internal error occurred while processing ed/vi internal buffers. No file damage has occurred, but ed/vi has lost track of where it is in the file.

#### **User response**

Quit editing the current file, and restart the editor again. If the error persists, contact your system programmer.

FSUM7954

Internal error: Line out of range.

## **Explanation**

An internal error occurred while processing ed/vi internal buffers. No file damage has occurred, but ed/vi has lost track of where it is in the file.

#### User response

Quit editing the current file, and restart the editor again. If the error persists, contact your system programmer.

FSUM7955

Internal error: line too long--DANGER.

An internal error occurred while processing ed/vi internal buffers. No file damage has occurred, but ed/vi has lost track of where it is in the file.

### **User response**

Quit editing the current file, and restart the editor again. If the error persists, contact your system programmer.

**FSUM7957** 

Nonzero address required on this command

## **Explanation**

You specified zero (0) as a line address for a command which does not accept 0 as a valid line address.

## User response

Specify a nonzero line address.

FSUM7960

Internal error: ltsave().

#### **Explanation**

vi's internal tables, which store line table information, have been corrupted.

## System action

The program continues.

## System programmer response

Follow local procedures for reporting a problem to IBM.

#### **User response**

If you want to try to save the latest changes, use : w newfilename (where newfilename doesn't already exist) to avoid overwriting the current \_file. Check the original file and the new file ( newfilename) for corruption, and contact your system programmer.

**FSUM7963** 

command: Value "option\_value" specified for option\_keyword is not supported for text conversion.

### **Explanation**

The specified value is not supported on the command for the specified keyword. The value was specified either with the –W option or as part of the \_TEXT\_CONV environment variable.

## User response

Correct the value specified and try the operation again. See the command documentation in z/OS UNIX System Services Command Reference for a description of supported values.

**FSUM7964** 

command: Could not turn autoconversion off for file. fcntl() failed with error\_number.

# **Explanation**

The command could not disable autoconversion.

## System programmer response

Follow local procedures for reporting a problem to IBM.

## **User response**

See the fcntl() system call documentation in  $\underline{z/OS}$  C/C++ Runtime Library Reference for more information about the error number. If the error persists, contact your system programmer.

**FSUM7969** 

File is read only

## **Explanation**

You attempted to write to a file that is considered to be read-only by the file system, or you had enabled the **set** variable readonly.

## **User response**

Save the changes you have made to a different file name. Use **chmod** to change the file access permissions, and reread the file. If you set the readonly variable to on, you can set it to off before writing the file with set noreadonly or you can use the **w!** command to force the write.

FSUM7971

Write error (out of space?)

# **Explanation**

A write error occurred. It is possible that there was no remaining disk space.

#### **User response**

Make room on the current disk, or save to another disk that you know has space available.

FSUM7972

File exists - use "w! filename" to overwrite

## **Explanation**

You attempted to write to a file that already exists.

#### **User response**

Specify an unused file name, or use the suggested command to overwrite the existing file.

**FSUM7976** 

No previous command to substitute for!

#### **Explanation**

You attempted to repeat a previous shell command when no initial shell command had been made.

### **User response**

Specify the shell command explicitly.

**FSUM7988** 

Buffers are 1-9, a-z

### **Explanation**

You specified an invalid buffer name. Buffers A to Z are valid in both **ex** and **vi** mode, while buffers 1 to 9 are valid only in **vi** mode and are read-only.

Specify a valid buffer name.

#### FSUM7992

#### Line overflow Result line of join would be too long

# **Explanation**

You attempted to use the **join** command to combine several lines into a single line, the length of which would exceed the maximum line length indicated by the configuration variable LINE\_MAX.

## **User response**

Specify fewer lines to be joined.

**FSUM7994** 

Too dangerous to map that.

# **Explanation**

You specified a multikey mapping that did not begin with a nonalphabetic character.

## **User response**

Choose a multikey mapping that begins with a nonalphabetic character.

FSUM7995

No identity mappings allowed.

## **Explanation**

You specified a mapping of the form: **map***lhs rhs* where *lhs* and *rhs* were identical strings. **vi** reached its limit on the number of mappings, macros, and abbreviations allowed.

### **User response**

Use the **map** and **abbreviate** commands to view the current list of mappings and abbreviations, the use the **unmap** and **unabbreviate** commands to remove those that are not currently required.

**FSUM7998** 

Mapping "macro" is not defined

#### **Explanation**

You attempted to use *macro*, which was not defined with a **map** command.

#### **User response**

Use **map** to create *macro*.

FSUM8000

Nothing to repeat

#### **Explanation**

You attempted to use the . command to repeat the previous command; however, you had not entered a previous command.

#### **User response**

Only use the . command once you have entered at least one command.

**FSUM8001** 

Last repeatable command overflowed the repeat buffer

You attempted to repeat a command that overflowed the fixed size repeat buffer.

## **User response**

Reenter the command in full.

FSUM8002

No previous regular expression

## **Explanation**

You attempted to repeat a regular expression search when no initial search had been made.

#### **User response**

Specify a regular expression explicitly in your search command.

FSUM8004

Not enough memory for screens

## **Explanation**

**vi** attempted to set up the necessary structures for full-screen operation and failed. There are not enough free system resources to run **vi**.

### **User response**

Free up more resources.

**FSUM8008** 

Digits required after =

# **Explanation**

You attempted to assign a nonnumeric value to a numeric variable using **set**.

#### **User response**

Specify a valid number.

**FSUM8009** 

Bad tag|Give one tag per line

## **Explanation**

You attempted to reference more than one tag on a line.

#### User response

Specify only one tag name on a line.

FSUM8010

No tags file

## **Explanation**

You specified a tags file with the tags variable that vi was unable to find.

#### **User response**

Check the *Ex Commands* subsection of the vi man page for information on using the **set** command to set the tags variable, or the man page for ctags for information on generating a tags file.

**FSUM8011** 

string: No such tag@in tags file

You attempted to reference a tag that was not present in the tags file.

## **User response**

Either use ctags to regenerate the tags file, or add the entry by hand to the tags file.

FSUM8020

write: user logged in more than once ... writing to tty

## **Explanation**

You tried to write to the user's terminal but *user* was logged in multiple times. **write** writes to the user 's session on the terminal *tty*.

## **User response**

If you want to write to a different terminal than the one that **write** chose, specify the terminal argument on the command line.

FSUM8023

write: user not logged in on that tty

## **Explanation**

You tried to write to user at a specific terminal but user was not logged in on that terminal.

## **User response**

Retry your **write** command without specifying *terminal*.

FSUM8024

write: user not logged in

#### **Explanation**

You tried to write to user 's terminal but user was not logged in.

#### **User response**

Send e-mail to user.

**FSUM8025** 

target terminal "tty"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8030** 

size for -option must be <num>

#### **Explanation**

You specified a numeric argument for – option that was greater than or equal to num.

## **User response**

Specify a numeric argument that is less than *num*.

FSUM8054

Code started at line *num* never ends

## **Explanation**

Your grammar contained a **yacc** action that was not terminated with a \{\}.

614 z/OS: z/OS UNIX System Services Messages and Codes

Provide the missing \{.

**FSUM8055** 

union declaration started at line num never ends

### **Explanation**

Your grammar contained a union { declaration that lacked an ending }.

## **User response**

Provide the missing \{.

FSUM8058

Variables aren't allowed here

# **Explanation**

Your grammar attempted to set precedence/association of a variable (nonterminal).

## **User response**

You can only set precedence or association of tokens.

**FSUM8059** 

Sorry, value *num* is reserved for *EOF/error* 

#### **Explanation**

Your grammar attempted to use a yacc internal token number.

## **User response**

Use a different token number.

**FSUM8061** 

Start symbol must be a variable

#### **Explanation**

Your grammar used a token as a start symbol.

#### User response

You must use a variable (nonterminal) as a start symbol.

**FSUM8062** 

Warning: start symbol redefined; was value

**Explanation:** 

Warning: start symbol redefined; was value.

FSUM8069

ITEM and lookahead TOO BIG

## **Explanation**

**yacc** was unable to create a human-readable state list due to a lack of available system resources. This only occurs when **yacc** reports on conflicts in the grammar.

#### **User response**

Fix conflicts in the yacc grammar.

FSUM8070

ispace: should be ni , is %ip-ispace

#### **FSUM** messages

### **Explanation**

This is an internal error within yacc.

# **System action**

The program ends.

## **System programmer response**

Follow local procedures for reporting a problem to IBM.

## **User response**

Contact your system programmer.

FSUM8071

Unknown reserved word: word

## **Explanation**

Your grammar contained a % keyword that yacc did not recognize, most likely due to a misspelling in word.

### **User response**

Correct the spelling of word.

FSUM8072

Comment started at line num never ends

# **Explanation**

Your grammar contained a comment that did not have a closing \*/.

### **User response**

Provide the missing \*/.

FSUM8073

End of file in character constant

# **Explanation**

Your grammar contained a character constant that was missing the closing quote.

## **User response**

Provide the missing quote.

**FSUM8074** 

**Empty character string** 

## **Explanation**

Your grammar contained a quoted character string with no characters.

### **User response**

Make sure that all quoted strings contain characters.

**FSUM8076** 

**Mangled character constant** 

Your grammar contained an illegal character constant.

## **User response**

Check and correct grammar.

FSUM8103

Out of memory at num bytes

## **Explanation**

yacc has run out of system resources for this input grammar.

# **User response**

Simplify your grammar, or free more system resources.

**FSUM8105** 

pspace: should be num1 is num2

## **Explanation**

An internal error occurred during yacc processing.

## **System action**

The command ends.

#### User response

Follow local procedures for reporting problems to IBM.

**FSUM8145** 

Undefined nonterminal 'name'

## **Explanation**

A grammar rule referenced a rule or token which is not defined.

### **User response**

Add the appropriate grammar rule or token.

FSUM8149

write: no permission to write to user on terminal tty

### **Explanation**

You tried to write to a user who had disabled communication with mesg.

## **User response**

Send e-mail to user.

**FSUM8155** 

Missing keydefinition after -k

## **Explanation**

You specified the -k option without providing a key definition as an argument.

#### **FSUM** messages

## **User response**

Provide the missing key definition.

#### **FSUM8181**

String started at line num never ends.

## **Explanation**

Your grammar contained a string in a yacc action that was not terminated.

## **User response**

Make sure the string is terminated.

**FSUM8183** 

Code segment started at line num never ends.

## **Explanation**

Your grammar contained a code segment that lacked an ending %}.

## **User response**

Provide the missing %}.

**FSUM8193** 

Mark must be a lowercase letter.

### **Explanation**

You used the **m** command to mark a position in the file; however, you attempted to name the mark with a character other than a lowercase letter.

## **User response**

Use lowercase letters for all mark names.

**FSUM8194** 

Cannot edit standard input.

### **Explanation**

You attempted to use the  $\mathbf{v}$  command to edit text that was coming from the standard input stream.

## **User response**

Store the input text in a temporary file and then use more to view that file. This allows you to edit the text if necessary.

**FSUM8196** 

Syntax error in word expansion.

### **Explanation**

You provided an invalid file name pattern.

## **User response**

Check the pattern and try again.

**FSUM8210** 

file "filename...": Line too long

### **Explanation**

A line in the file containing the list of file names is too long.

618 z/OS: z/OS UNIX System Services Messages and Codes

Inspect the file containing the list of file names for invalid input.

**FSUM8211** 

**Null to Expand** 

### **Explanation**

The system encountered an internal error while trying to expand a null string.

## **System action**

The program ends.

# System programmer response

Follow local procedures for reporting problems to IBM.

### **User response**

Contact your system programmer.

**FSUM8213** 

Invalid hop count: num

## **Explanation**

You specified the -h option, but the argument that you provided with it is not a valid number.

#### User response

Provide a valid number as the argument to the -h option.

FSUM8214

**Badly specified macro** 

## **Explanation**

The syntax of the macro is incorrect.

#### **User response**

Use the correct syntax to specify the macro.

FSUM8219

tsmail: writing mailbox "mailbox"

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8223** 

**Expansion too long** 

# **Explanation**

After expansion, the macro is too long for the supplied buffer.

### **User response**

Modify the macro so that it expands to less than STRING\_SIZE (8192) bytes.

FSUM8226 make: Error code retcode

Make exited for one of these reasons:

- make itself encountered an error while executing a recipe. See the <u>z/OS UNIX System Services Command</u> Reference for a complete description of error codes returned by make.
- A recipe command executed by make returned with an error code. In this case the error code is the exit status
  of the failed command.

## **User response**

Make treats this as an error unless the . IGNORE attribute has been used, or if the recipe line was preceded by a - character. If a nonzero return code is acceptable, modify the recipe line in the makefile so that the return code from this command line is ignored.

#### FSUM8229

#### Incomplete rule recipe group detected

## **Explanation**

You specified a group recipe but omitted the closing ].

## **User response**

Add the closing square bracket.

#### **FSUM8230**

#### Cannot mix single and group recipe lines

## **Explanation**

You attempted to mix recipe lines with group recipes for the same rule.

### **User response**

Either make the entire recipe a group, or remove the group.

#### **FSUM8231**

## Found unmatched 'l'

## **Explanation**

You specified a ] in your makefile for a group recipe without providing the matching [.

#### User response

Provide the missing [.

#### **FSUM8232**

#### Expecting macro or rule defn, found neither

## **Explanation**

Make expected this line in the makefile to contain a macro or rule definition, but it didn't. This probably indicates a syntax error in the makefile, or a comment which is missing the # symbol.

### **User response**

Correct this line in the makefile so it follows Make syntax rules. If the line is a comment, ensure that it starts with the # symbol.

### **FSUM8233**

#### Illegal parser state state

Internal error.

# **System action**

The program ends.

## **System programmer response**

Follow local procedures for reporting problems to IBM.

## **User response**

Contact your system programmer.

#### **FSUM8236**

Only a single % allowed in a target pattern

## **Explanation**

A metarule target contained more than one '%'. It may only contain one.

### **User response**

Remove the additional percent signs.

#### **FSUM8241**

Unable to determine current directory.

# **Explanation**

make was unable to find out what its current directory was.

## **User response**

Verify that you have all necessary permissions to determine your current directory.

#### FSUM8242

Operator after special target treated as ':'

## **Explanation**

You specified a modifier, such as !, with a rule defining a special target. make ignores any such modifiers.

### **User response**

Remove the extraneous modifier.

#### **FSUM8244**

Multiple targets are not allowed in % rules.

## **Explanation**

You specified a metarule with more than one target. A metarule can have only one target specified.

### **User response**

Refer to the section in z/OS UNIX System Services Programming Tools on inference rules and correct the makefile.

#### **FSUM8245**

Special target must appear alone.

You specified a special target which cannot appear with any other target in a rule. For example, a rule with .ERROR as a special target cannot mention any other target.

### **User response**

Correct the line.

**FSUM8247** 

Syntax error in % rule, missing % target

## **Explanation**

You specified your meta-rule incorrectly. The target must contain a %.

## **User response**

Correct the syntax of the rule.

**FSUM8249** 

Missing targets or attributes in rule

## **Explanation**

When reading input, make encountered a rule that had no targets or attributes specified.

## **User response**

Correct the syntax of your makefile.

FSUM8253

No .INCLUDE file(s) specified

# **Explanation**

You specified a . INCLUDE special target without providing the names of the files to be included.

## **User response**

Refer to the description of the .INCLUDE target in z/OS UNIX System Services Programming Tools and add the missing file names.

**FSUM8257** 

Attributes possibly ignored

## **Explanation**

A special target may inherit attributes, but only certain attributes take effect on specific special targets.

#### User response

Refer to the description of make in z/OS *UNIX System Services Command Reference* for more information about which attributes may be applied to which special targets.

**FSUM8260** 

Nonglobal attributes ignored

### **Explanation**

You specified attributes that are nonglobal. make will ignore them.

### User response

Remove the attributes.

**FSUM8263** 

**Invalid library format** 

# **Explanation**

make attempted to access a library that was not in the correct format.

## **User response**

Verify that your library is correct and rebuild it if necessary.

**FSUM8267** 

Too many arguments -- limit num

# **Explanation**

Too many arguments were produced when make tried to execute a line in a recipe.

## **User response**

Simplify the recipe line.

**FSUM8565** 

tsmail: temporary file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8566** 

tsmail: writing temporary file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8703** 

No 'makefile' present

### **Explanation**

make was unable to find Makefile or makefile, and did not have any default rules.

### User response

Create the missing makefile, or add default rules to startup.mk.

**FSUM8704** 

Missing .END for .IF

### **Explanation**

You specified a . IF statement without the corresponding . END statement.

### **User response**

Provide the missing . END statement, or remove the extra . IF statement.

**FSUM8705** 

No target

# **Explanation**

make had a makefile to process, but did not find a rule defining a target to be made.

### **User response**

Add a target rule to your makefile, or specify a target on the command line.

FSUM8707

Openfile: bad name

# **Explanation**

make attempted to open a file with an invalid or NULL name.

## **User response**

Edit the makefile and correct the file name.

**FSUM8708** 

file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8710** 

command: file "string": Incorrect format for -D option

## **Explanation**

You attempted to use the -D option to decompress a file that was not compressed with the -D option of compress.

## User response

Only use the -D option of uncompress to decompress files compressed with the -D option of compress.

**FSUM8714** 

No more memory

## **Explanation**

make was unable to allocate storage space.

#### **User response**

Free up some resources and try again.

**FSUM8716** 

pipe to command "cmd"

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8717** 

tmp file "filename"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8718** 

name: cannot open: string

### **Explanation**

Could not open the file. This message is followed by a system error describing the specific reason for the error.

# **System action**

The program ends.

Refer to the system error message and take appropriate action.

FSUM8721

list file "filename"

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM8723

**Unmatched** "quote

## **Explanation**

You specified an opening " on a line that did not contain a closing ".

### **User response**

Correct the line.

**FSUM8724** 

.ELSE without .IF

## **Explanation**

You specified a .ELSE statement without a corresponding . IF statement.

### **User response**

Provide the corresponding . IF and . END statements (if necessary), or remove the . ELSE statement.

**FSUM8725** 

**Unmatched** .END

### **Explanation**

You specified a .END statement without the corresponding .IF statement.

## **User response**

Provide the missing . IF statement, or remove the extra . ELSE statement.

**FSUM8726** 

No macro name

### **Explanation**

A macro assignment = appears without a macro name.

## **User response**

Correct the line.

**FSUM8728** 

Write error on temp file

## **Explanation**

An error occurred while trying to write on a diversion or group recipe temporary file.

#### **User response**

Ensure that there is space on the file system containing the temporary file.

FSUM8730

&lt+ diversion unterminated

#### **FSUM** messages

### **Explanation**

You specified a &1t+ to begin a diversion, but did not specify the corresponding +> to end it.

## **User response**

Provide the closing +>.

FSUM8731

Directory stack empty in pop.

# **Explanation**

Internal error.

# System action

The program ends.

# **System programmer response**

Follow local procedures for reporting problems to IBM.

## **User response**

Contact your system programmer.

FSUM8732

&lt+ missing before +>

## **Explanation**

You specified a +> to end a diversion before specifying the corresponding <+ to begin it.

### **User response**

Ensure that corresponding <+ and +> symbols appear in the correct order.

**FSUM8733** 

file: misplaced & in magic file

# **Explanation**

You specified a magic file containing a line beginning with a & that did not follow a regular template line.

### **User response**

Either create a template line before the line, or remove the line.

**FSUM8734** 

cannot access file "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8735** 

Too many mail folders specified on command line.

## **Explanation**

The -f flag was specified, and more than one mail folder was named on the command line.

List only one file name on the command line.

FSUM8736 tsmail: invalid user "user"

### **Explanation**

The name user, which was specified as a recipient of the message, is not a valid user on the system.

#### **User response**

Check the spelling of the recipient's name, and try to send your message again.

FSUM8737 tsmail: cannot lock file "filename"

## **Explanation**

The mailbox *filename* could not be locked, so the message could not be delivered.

## **User response**

Wait a little while and try to send the message again.

FSUM8738 tsmail: re-opening temporary file "filename"

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM8739 tsmail: chowning mailbox "mailbox"

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM8740 command: input file "filename": error

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM8741 Number "string"

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM8742 window size too large

# **Explanation**

You specified a window size (lines per page) with the - or -n option that was greater than the number of lines on the screen (as given by the environment variable LINE).

#### **User response**

Specify a smaller window size.

FSUM8743 window size too small

You specified a window size (lines per page) with the - or -n option that was less than three.

#### User response

Specify a window size of at least three lines.

**FSUM8745** 

line line\_num: Bad length

## **Explanation**

The length of a line did not match the length indicated by the first character in the line; perhaps the input file was corrupted.

## User response

Check that the input is valid uuencoded data.

**FSUM8746** 

line line num: Line too short (num1 bytes, expecting num2)

## **Explanation**

The length of a line did not match the length indicated by the first character in the line; perhaps the input file was corrupted.

## User response

Check that the input is valid uuencoded data.

**FSUM8747** 

No last buffer executed

### **Explanation**

You attempted to repeat a macro when no macros had been previously executed.

#### **User response**

Execute a specific macro before attempting to repeat it.

**FSUM8749** 

What? command: Not an editor command

## **Explanation**

You specified command in Ex mode; however, command is not a valid editor command.

#### User response

Check the Ex Commands section of the vi man page for a list of valid editor commands.

**FSUM8750** 

Badly formed re Regular expression \ must be followed by / or?

#### **Explanation**

When using a regular expression in an address, you followed a backslash ( $\setminus$ ) with a character other than / or ?.

#### User response

Delimit the regular expression with  $\ \ \$ ?.

**FSUM8754** 

Too long | Result of substitute would produce a line too long

You specified a replacement string in a **substitute** (or **s**) command that would result in a line that is too long for vi to handle.

## **User response**

Specify a shorter replacement string, or break the original line into two or more shorter lines before performing the substitution.

**FSUM8755** 

Bad RE delim|Regular expressions cannot be delimited by letters or digits

## **Explanation**

You attempted to use an alphanumeric character to delimit a regular expression.

## **User response**

Use a nonalphanumeric character as the delimiter.

**FSUM8756** 

Environment variable HOME not defined.

## **Explanation**

You attempted to change the current working directory to your home directory by using the **cd** or **chdir** command without specifying a path name; however, the environment variable HOME was not defined.

## **User response**

Set HOME to your home directory, or specify the complete path name of your home directory when using **cd** or **chdir**.

**FSUM8764** 

Unknown uid *num* Unable to recover

## **Explanation**

Your user ID could not be found. This ID (typically your login name) is used to locate files that were lost or preserved by the use for subsequent recovery at a later time.

### **User response**

Contact your system programmer.

**FSUM8765** 

Internal error: glob routine: Code code

### **Explanation**

While attempting to get a list of all recovered files, the C/C++ Run-Time Library function glob() failed, for the reason specified by *Code*. It is possible that an attempt to allocate memory failed.

## **System action**

The program continues.

### **User response**

The return codes of glob are specified in glob.h. Look in glob.h to find the exact reason for the failure, and attempt the command again.

FSUM8766

"string": File not found

## **Explanation**

You specified the name of a file that does not exist.

### **User response**

Ensure that you spelled the file name correctly, and that you have appropriate permissions to access the file.

FSUM8770

\&ltdigit> value too large

## **Explanation**

When using a numerical reference to a subexpression within the regular expression, the number used exceeded the number of subexpressions present.

## **User response**

Ensure that numerical references to subexpressions are valid.

**FSUM8772** 

**Internal Error:** 

## **Explanation**

An internal error occurred.

#### **User response**

Contact your system programmer. Follow local procedures for reporting a problem to IBM.

**FSUM8774** 

%prec needs a token; string isn't

**FSUM8785** 

grammar file "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8786** 

header file "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM8787

listing file "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8788** 

parser file "filename"

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM8789

file I/O error

A system error indicating the cause is displayed with this message.

FSUM8810	Use yaccp to generate Turbo Pascal code on DOS.
FSUM8811	The prototype for Pascal code is /etc/yyparse.pas.
FSUM8813	Warning: newline in character constant

## **Explanation**

The lexical analyzer encountered a character constant that begins on one line and ends on another. This often indicates a missing quote.

# **System action**

The command continues.

## **User response**

Add the missing quote.

FSUM8819

unlink temp file "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8820** 

write error on temporary file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

FSUM8821

file "filename" is binary

## **Explanation**

You specified the binary file *filename* as a diff input file. diff only works on text files.

### **User response**

Only specify text files as diff input files.

**FSUM8822** 

file "filename": line too long: limit LINE\_MAX

# **Explanation**

The input line is too long.

#### **User response**

Try again with a shorter input line.

**FSUM8824** 

yacc bug:

### **Explanation**

An internal error occurred.

Contact your system programmer. Follow local procedures for reporting a problem to IBM.

#### **FSUM8842**

#### codeset translation initialization

### **Explanation**

The iconv\_open() function failed. A system error indicating the cause is displayed with this message.

## System programmer response

Determine why the iconv\_open() function failed.

## **User response**

Contact the system programmer.

#### **FSUM8843**

codeset translation

# **Explanation**

The inconv() function failed. A system error that indicates the cause may be displayed with this message.

## System programmer response

Determine why the iconv() function failed.

## **User response**

Contact the system programmer.

#### FSUM8913

unexpected end of file.

## **Explanation**

The end of the file was encountered prematurely.

# **System action**

The program ends.

## **User response**

Check the input file for truncation.

#### **FSUM8955**

couldn't allocate memory (num bytes requested)

# **Explanation**

The system did not have enough free resources to allocate *num* bytes.

### **User response**

Free up more resources.

# FSUM8957

**Unexpected EOF in escape sequence** 

While reading the input data, col discovered an escape sequence which was terminated by an unexpected EOF.

## **User response**

Check the input data for unexpected truncation.

**FSUM8958** 

read error on "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8960** 

can't stat file "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM8961

output file "(standard output)"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8976** 

Error writing "sourcename" to PDSE member "targetname".

## **Explanation**

An error occurred while attempting to write a data member to a PDSE containing program object members. A PDSE cannot contain both program object members and data members.

## **System action**

The command ends.

#### **User response**

Use the -X option on the **cp** or **mv** command to specify that the member to be copied or moved is a program object member, and try the request again.

**FSUM8977** 

command: source "name1" and target "name2" are identical

# **Explanation**

You specified source and target files that are actually the same file (for example, because of links).

#### **User response**

No further action is required.

FSUM8979

target "filename" must exist

### **Explanation**

The destination directory must exist for this utility to work.

### **User response**

Check the command line arguments. You may need to create the target directory.

#### **FSUM8980**

cannot create parent directory for target "filename"

## **Explanation**

An error occurred while trying to create the parent directory of the specified target file.

### **User response**

Make sure you have permissions to create the directory.

FSUM8981

Error copying file file1 to file2

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8982** 

command: internal error: unknown return code from m\_cp: string

## **Explanation**

An internal error occurred.

### User response

Contact your system manager.

FSUM8983

Cannot reset times on file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8984** 

Cannot reset permissions on file "filename"

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8985** 

Cannot reset uid or gid on file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM8986** 

must run as setuid root

### **Explanation**

The program issuing this message must run with effective user ID of root-- the setuid bit should be set on and the program should also have root ownership.

## User response

Contact system administrator. For security reasons, verify that the program issuing this message should run setuid root. If so, turn on setuid bit for the program ("chmod u+s program") and ensure root ownership ("chown root program").

**FSUM8987** 

you are not authorized to use at. Sorry.

The system programmer had not configured at to allow you to use it.

### **User response**

Contact your system programmer about gaining access to at.

FSUM8988

bad time format

### **Explanation**

You specified a time format that at does not recognize.

## **User response**

Check the Time Specification subsection of the at man page for a list of valid time formats.

FSUM8989

unable to spool at job.

# **Explanation**

at was unable to create a spool file, in which to store the job.

### **User response**

Contact your system programmer.

**FSUM8990** 

at job "at\_job": insufficient permission.

## **Explanation**

You attempted to remove an  $\alpha t_{job}$  which but you did not submit.

#### **User response**

Only the user root can remove arbitrary at-jobs.

FSUM8991

No time specified

### **Explanation**

You did not specify a time specification on the command line.

#### **User response**

Specify a time specification.

FSUM8992

**Invalid time keyword** 

#### **Explanation**

You specified what appeared to be a time keyword, but at does not recognize it as a valid time keyword.

#### **User response**

Use only noon, midnight, next, and now as time keywords.

FSUM8993

Two digits must follow ":"

You specified a colon (:) to separate hours from minutes, but you did not follow it with two digits.

### **User response**

When specifying minutes after a colon (:), you must use a two digit number.

FSUM8994

hour must be 1-12 for 12 hour clock

## **Explanation**

You provided an a.m./p.m. designation, but you specified an hour that was not in the range 1 to 12.

### User response

When using the 12 hour clock, specify an hour in the range 1 to 12.

FSUM8995

hour or minute out of range

## **Explanation**

When specifying a time in the format hh:mm, the hour value (hh) was not in the range 0 to 23 or the minute value (mm) was not in the range 0 to 59.

### **User response**

Specify a time where the hour and minute values fall within the ranges 0 to 23 and 0 to 59 respectively.

FSUM8996

TZ environment variable must be set

# **Explanation**

The environment variable TZ was not set.

## **User response**

Assign a value to the variable TZ (see the timezone man page for more details.), or specify a time zone in the time specification.

**FSUM8997** 

date must follow month

# **Explanation**

You specified the day of the month before the month name in your time specification.

#### **User response**

Always specify the month name before the day of the month.

**FSUM8998** 

year must follow ","

#### **Explanation**

You specified a comma (,) in your time specification, but you did not provide a year following it.

#### User response

Provide the missing year.

FSUM8999

invalid year

636 z/OS: z/OS UNIX System Services Messages and Codes

You specified a year that was less than 1970.

### **User response**

Specify a year greater than or equal to 1970.

#### FSUM9000

increment requires number

### **Explanation**

You specified a + to indicate an increment, but you did not provide a number following it.

## **User response**

Provide the missing number following the +.

#### FSUM9001

invalid increment unit

# **Explanation**

You specified an invalid unit for the increment in the time specification.

#### **User response**

Check the Time Specifications subsection of the at man page for a list of valid units.

#### FSUM9002

garbage after time specification

## **Explanation**

You specified extra characters after the end of the time specification on the command line.

#### **User response**

Check the *Time Specifications* subsection of the at man page for the proper syntax of time specifications and remove the extra characters.

### **FSUM9003**

"next" must not specify year

### **Explanation**

You specified the next time format with a year. at does not support this form of time specification.

#### User response

Do not specify a year with next.

#### FSUM9004

"next" requires either date or weekday

#### **Explanation**

You attempted to use the next time format without specifying a date or weekday.

#### **User response**

Specify a date or weekday when using the next time format.

#### FSUM9005

string: invalid year

#### **FSUM** messages

### **Explanation**

You specified a year that was not in the range 1970 to 2000.

### **User response**

Specify a year in the range 1970 to 2000.

#### FSUM9007

#### Field delimiter specified by -d must be one character

### **Explanation**

You specified a field delimiter (as an argument to the -d option) that was more than one character long.

### User response

Specify a single character field delimiter.

**FSUM9008** 

file "[standard input]"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9010** 

date: bad format or date output longer than number bytes

### **Explanation**

The format string supplied to date is invalid, or the output is longer than the size of the date buffer.

## **User response**

Confirm that the date format string on the command line is valid.

**FSUM9086** 

no space for line table

## **Explanation**

There were not enough free system resources to allocate initial resources for ed.

## **User response**

Free up more system resources and restart program.

**FSUM9087** 

Input line too long

#### **Explanation**

You entered an ed command which was too long.

#### **User response**

Simplify the command and try again.

**FSUM9088** 

no memory for pages

#### **Explanation**

There were not enough free system resources to allocate initial resources for ed.

Free up more system resources and restart program.

FSUM9090

no memory for line number tables

### **Explanation**

There were not enough free system resources to allocate initial resources for ed.

### **User response**

Free up more system resources and restart program.

FSUM9091

Result of substitution would produce a line too long

## **Explanation**

You specified a replacement string in a substitution command that would produce a line that is too long for ed to handle.

### **User response**

Specify a shorter replacement string or split the original line into shorter lines before performing the substitution.

FSUM9092

Result line of join too long

### **Explanation**

You attempt to use the  $\mathbf{j}$  command to join a range of lines into one line; however, the resulting line would be too long for ed to handle.

#### **User response**

Specify a smaller range of lines to be joined.

**FSUM9094** 

find: must specify a command after -exec/-ok

#### **Explanation**

You specified either the -exec or the -ok primary without specifying a command to be performed.

#### **User response**

Provide the missing command.

FSUM9104

terminfo definition file "filename"

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM9105

terminfo database "filename"

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM9106

terminfo database directory "pathname"

A system error indicating the cause is displayed with this message.

**FSUM9110** 

Not enough memory for use\_list element

### **Explanation**

There were not enough free system resources to allocate for the use\_list element.

#### **User response**

Free up more resources.

**FSUM9118** 

Failed to allocated memory.

## **Explanation**

There were not enough free system resources to perform the desired operation.

### **User response**

Free up more resources.

**FSUM9139** 

Failed to allocate required memory.

#### **Explanation**

There were not enough free system resources to perform the desired operation.

### **User response**

Free up more resources.

FSUM9140

Terminal "term" has insufficient capabilities for Curses.

### **Explanation**

Your TERM environment variable setting provides insufficient functions from the curses library to support this program. This most likely occurs when running vi from the OMVS shell, which sets TERM=dumb.

#### **User response**

vi cannot be run from the OMVS shell. vi can only be run via a "raw-mode" session, such as telnet or rlogin. The value of TERM should not be changed from the setting assigned by your terminal.

**FSUM9153** 

Cannot chdir to directory-name

#### **Explanation**

Could not change directory to directory-name.

# System action

The program ends.

#### User response

The system error displayed with this message indicates the cause.

**FSUM9154** 

Shell (filename) not executable.

640 z/OS: z/OS UNIX System Services Messages and Codes

The newgrp utility attempted to invoke a new shell named *filename*, but it could not be run.

# **System action**

The newgrp command ends, and the shell from which newgrp was issued is terminated (because newgrp has already replaced the shell's process image).

#### **User response**

Check that the filename is a valid shell (command interpreter) and that it has the correct permissions.

FSUM9156

login: cannot fork passwd command

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM9164

Internal error: 10 too small in Get token()

### **Explanation**

An internal error occurred.

#### **User response**

Contact your system programmer. Follow local procedures for reporting a problem to IBM.

FSUM9165

.IF .ELSE ... .END nesting too deep

## **Explanation**

The nesting of .IF.ELSE ... .END structures is too deep.

#### **User response**

Modify your makefile so that these structures are not nested as deep.

FSUM9169

Internal, buildList buffer too small

## **Explanation**

Internal error.

#### **System action**

The program ends.

#### **System programmer response**

Follow local procedures for reporting problems to IBM.

#### **User response**

Contact your system programmer.

**FSUM9170** 

<+ diversion cannot be nested

You attempted to put one < + diversion inside another &lt; + diversion. make does not permit this.

#### **User response**

Remove the nested < + diversion.

FSUM9174

reading file

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9179** 

seek past EOF on input

### **Explanation**

The seek offset specified on the command line was greater than the size of the input file.

## **User response**

Check the offset and try again.

**FSUM9181** 

string: component too long.

### **Explanation**

- p

One of the components of the path name provided is longer than is allowed by the filesystem (or by POSIX, if was specified).

#### **User response**

Try to shorten the component or components of the path name.

FSUM9182

string: pathname too long.

### **Explanation**

The length of the path name provided is longer than that allowed by the filesystem (or by POSIX, if -p was specified).

#### User response

Try to shorten some of the components of the path name, in order to reduce the overall length of the path name.

FSUM9183

string: Not searchable.

#### **Explanation**

You specified a path name pathname that was not searchable.

#### **User response**

Specify a different path name.

FSUM9184

string: requested format differs from the existing archive format

You used the -a option with -xformat, where the archive already existed with a different format.

### **User response**

Do not specify the format when appending to an existing archive, or specify the correct format.

FSUM9185

Symbolic link name too long: Not extracted

### **Explanation**

Couldn't allocate enough memory to hold the symbolic link's name.

### **User response**

Archive contains symbolic name which is too large; no action possible.

FSUM9186

Missing format specification

# **Explanation**

You did not specify a format specification on the command line.

#### **User response**

Provide the missing format specification.

**FSUM9188** 

unused argument at "arg"

## **Explanation**

You specified a format string without any conversion specifications.

#### **User response**

Add at least one conversion specification to your format string.

FSUM9190

not a valid real argument "string"

### **Explanation**

You specified a format specification that was expecting a real (that is, floating-point) number, but you provided the argument *string* which was not a valid real number.

#### **User response**

Provide a valid real number in place of string.

FSUM9191

cannot allocate buffer for pathname

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM9192

cannot determine working directory

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9195** 

cannot unlink entry "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9196** 

cannot remove directory "pathname"

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM9199

input line too long

## **Explanation**

A line in the input file was longer than 10240 bytes.

## **User response**

Make sure that the input file is a text file.

**FSUM9200** 

reading from file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

FSUM9201

input file "filename" is binary

# **Explanation**

You specified the binary file filename as a sed input file. sed only works on text files.

#### **User response**

Only specify text files as sed input files.

FSUM9203

unmatched {} commands

# **Explanation**

There is a '{' command in your script which does not have a corresponding '}' to terminate it.

#### **User response**

Make sure that there are as many '}' as there are '{'.

FSUM9204

pattern space overflow during G command

#### **Explanation**

The content of the hold buffer was too long to be appended to the pattern buffer.

#### **User response**

Place a smaller amount of text in the hold buffer.

**FSUM9205** 

hold space overflow during H command

You attempted to "hold" more data than would fit in the sed hold buffer.

### **User response**

Reorganize your script to require less data in the hold buffer.

FSUM9206

Can't chain "cmd" command

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9208** 

cannot redirect (dup2)

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM9209

cannot execute: reason code = reasoncode

### **Explanation**

A system error indicating the cause is displayed with this message.

### System programmer response

Take appropriate action based on reason code.

FSUM9210

Traced functions not effective unless -o korn is set

#### **Explanation**

"typeset -ft function" (turn on tracing for the named function) was specified, but KornShell mode wasn't enabled.

### **User response**

Don't specify "typeset -ft", or enable KornShell mode with "set -o korn".

**FSUM9221** 

get limit failed

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9222** 

set limit failed

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM9224

bad number "num"

### **Explanation**

Invalid string given where a number was expected. (MAILCHECK, TMOUT, OPTIND, HISTSIZE, and COLUMNS environment variables, or array subscript.)

Specify a decimal number (containing only the digits 0 through 9) to the appropriate environment variables or subscripts.

**FSUM9225** 

no memory: system\_error

## **Explanation**

A memory allocation failed with the error indicated.

## **User response**

This message could indicate that the user heap is exhausted. To avoid exhausting the user heap, set (export) the \_CEE\_RUNOPTS="HEAP(,,,FREE)" environment variable before reissuing the command or script. When this environment variable is set, it is unlikely that the user heap will be exhausted during normal use because all unused storage will be freed, but processing performance could be negatively impacted. Also take appropriate action based on the indicated error to make virtual memory available.. For more information about heap tuning, see z/OS Language Environment Programming Reference.

FSUM9230

Internal error: j\_close: no processes

#### **Explanation**

An internal error occurred.

#### **User response:**

Contact your system programmer. Follow local procedures for reporting a problem to IBM.

**FSUM9247** 

"filename"

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9249** 

Failed to allocate required memory.

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9259** 

Need an explicit type for \$n when n <= 0

### **Explanation**

In a grammar with a union declaration, an action references a Yacc symbol value n, where n <= 0, but no type is specified for n.

#### **User response**

Add an explicit type, of the form \$typen.

**FSUM9261** 

Need a type for name

## **Explanation**

In a grammar with a union declaration, an action is referencing a Yacc symbol value that does not have a type associated with it.

Use %type type rule to assign a type to a rule, or %token type tokenname to assign a type to a token. Alternatively, you can use explicit types within the action, in the form \$\fitypen.

FSUM9268

Too many makefiles specified.

# **Explanation**

You specified too many files using the -f option.

## **User response**

Combine one or more files into a single file.

**FSUM9270** 

Too many open files. Max nesting level is num

### **Explanation**

You have exceeded the maximum limit of .INCLUDES.

#### **User response**

Check to see if you have recursively included a make file, or simplify your makefile.

FSUM9271

Could not create string "string1/string2"

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9272** 

"TTY" group not found -- contact your system administrator

#### **Explanation**

Unable to find the group that owns all the terminals. The name of this group is an installation option. The getgrgid() function reported the failure.

#### **User response**

Contact your system administrator.

FSUM9273

Not setgid to group 'term\_group' -- contact your system administrator

## **Explanation**

The process does not belong to the term\_group group. It must belong to this group in order to run successfully.

#### **User response**

Contact your system administrator.

**FSUM9276** 

can't pass scalar to 'var[]'

#### **Explanation**

You tried to pass a scalar value to a function expecting an array parameter.

#### **User response**

Correct your program.

#### **FSUM9277**

can't pass array to 'var'

## **Explanation**

You tried to pass an array into a function expecting a scalar parameter.

#### **User response**

Correct your program.

**FSUM9278** 

built-in 'var' can't be used as a parameter or auto variable

# **Explanation**

You tried to use the name of a built-in function or variable as a parameter or local variable in a function.

### **User response**

Correct your program.

FSUM9279

string() is not a function

## **Explanation**

You tried to use *name* as a function when it was not defined as such.

### **User response**

Correct your program, or make sure that the spelling of *name* is the same as was used when defining the function.

**FSUM9280** 

'string' can only have values from num1 through num2

# **Explanation**

You tried to assign a value to a built-in variable that is outside the permitted range.

# **User response**

Check *z/OS UNIX System Services Command Reference* and correct your program to use a value that is within the acceptable range for that variable.

FSUM9281

while executing function funcname()

### **Explanation**

An error occurred while executing the named function.

#### **User response**

Determined by remainder of message.

FSUM9283

internal error: Converting wide character back to MB

# **Explanation**

An internal error occurred.

Contact your system manager.

**FSUM9285** 

Number "string" not in range num1.. num2

### **Explanation**

An invalid user ID was specified.

### **User response**

Ensure that the command line arguments are correct.

FSUM9309

Multibyte to wide character conversion error in "string"

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUM9310

Badly formed line/byte count "num"

### **Explanation**

You gave an invalid number for the -n option.

## **User response**

Correct the command line.

FSUM9311

Missing number after "-option" option

### **Explanation**

You specified the -option option without providing a number as its argument.

### **User response**

Provide the missing number.

**FSUM9312** 

byte count not in range num1..num2

#### **Explanation**

You gave an invalid byte count.

#### **User response**

On the command line, correct the byte count to a number that can be expressed by the machine architecture.

**FSUM9353** 

Bad multibyte delimiter after -t

### **Explanation**

The field separator specified for the -t flag was not a valid multibyte sequence.

#### **User response**

Check the command line and try again.

**FSUM9356** 

string: Internal error: nextrecord: Unexpected status return from

m\_fgetws: status

### **Explanation**

An internal error occurred.

#### **User response**

Contact your system manager.

**FSUM9357** 

Writing to standard output

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9358** 

**Writing unpaired records** 

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9364** 

Bad date conversion: string

## **Explanation**

The string passed to m\_readdate was not in a format that the function recognized.

## **User response**

Check the format of the date and try again.

**FSUM9366** 

invalid multibyte character

#### **Explanation**

An invalid multibyte character was encountered during the processing of a regular expression.

### **System action**

The command ends.

#### **User response**

Check the regular expression for invalid multibyte characters and reissue the command.

**FSUM9368** 

command: Only printable characters are permitted in log messages.

#### **Explanation**

You specified a nonprintable character in a log message.

#### **User response**

Replace the nonprintable character with one or more printable characters.

**FSUM9369** 

cannot allocate storage for environment

There is not enough free memory to build the new shell environment.

# **System action**

The command ends.

#### **User response**

Free up more resources and issue the command again.

FSUM9370	cannot set supplementary groups
FSUM9374	command: Failed to strip file "string".

## **Explanation**

An error occurred while trying to strip an executable file.

## **User response**

No action possible.

**FSUM9378** 

Special target [target] cannot be a prerequisite

#### **Explanation**

You tried to use a special target as a prerequisite.

# **User response**

Edit the makefile, and remove the special target from the prerequisite list.

FSUM9379

Option -c failed to change directory to "pathname": system\_error

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM9380

command: Unknown option -option

## **Explanation**

You specified an option that is not valid for this command.

#### **User response**

Check z/OS UNIX System Services Command Reference for a list of options.

FSUM9381

command: Option -string argument missing

#### **Explanation**

You specified the -option option without providing its required argument.

#### **User response**

Provide the missing argument.

**FSUM9383** 

Configuration file `filename' not found

Could not open the MAKESTARTUP configuration file.

### **User response**

The MAKESTARTUP file may be either misnamed or missing. Ensure that the MAKESTARTUP file exists, and that it is accessible. This may require setting the \\*[MACRO MAKESTARTUP] macro or MAKESTARTUP environment variable.

**FSUM9384** 

Unable to return to directory `pathname'

### **Explanation**

Make could not set the directory back to the original directory. The original directory may have been deleted, renamed, or had its permissions changed since Make was started.

### **User response**

Ensure that the directory exists and has the correct permissions. Attempt the make operation again.

**FSUM9385** 

file "filename"

# **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9387** 

Unable to change directory to `pathname'

## **Explanation**

Make could not set the directory back to the specified directory. The specified directory may have been deleted, renamed, or had its permissions changed since Make was started.

#### **User response**

Ensure that the directory exists and has the correct permissions. Attempt the make operation again.

**FSUM9392** 

file is binary

### **Explanation**

A file that was supposed to contain rules contained binary data.

#### **User response**

Ensure that the correct file name is specified and that the contents of the specified file are correct.

**FSUM9393** 

line too long: limit num

### **Explanation**

The makefile contains a line that exceeds the LINE\_MAX limit.

#### **User response**

Shorten the line. You can use the continuation character (backslash) to spread long rules over several lines in the makefile.

**FSUM9394** 

error reading file

A system error indicating the cause is displayed with this message.

#### FSUM9401

#### Inference rules result in circular dependency for [target]

### **Explanation**

The inference rules result in a target that depends upon itself.

### **User response**

Verify that the recipe lines are correct. Ensure that the meta rules or suffix rules are correctly specified. In some cases, you may need to use an explicit rule to override the action of the inference rules.

#### **FSUM9415**

Don't know how to make target

# **Explanation**

Make does not know how to make the given target.

### **User response**

Ensure that the target is defined in the makefile. The target may be declared directly by an explicit rule or indirectly by an inference rule.

#### FSUM9419

Mismatched braces in token 'token'

#### **Explanation**

The number of open braces ({) does not match the number of close braces ({}) in this token.

#### **User response**

Edit the token so that each open brace has a matching close brace.

#### **FSUM9424**

Argument string to (modifier) must be quoted with "

#### **Explanation**

The argument to this macro expansion must be quoted using double quotes.

#### **User response**

Modify the macro expansion so that the argument is quoted using double quotes.

#### **FSUM9428**

Ambiguity in target\_list targets [target], chose string

#### **Explanation**

The target list supplied to make is ambiguous and make chose string as the target from this list.

#### **System action**

The command continues.

## **User response**

If the target chosen by make is not the intended target for the current rule, then reformat the target list to be unambiguous and reissue the make command.

**FSUM9429** 

meta-rule too long: "rule"

### **Explanation**

The meta-rule contained its maximum number of characters before Make reached the end of the meta-rule.

#### **User response**

Shorten the meta-rule so it fits in DONE\_STATE characters.

FSUM9430

Internal, bad current dfa state num in [node\_name]

### **Explanation**

An internal error occurred.

### **User response**

Contact your system administrator.

FSUM9431

Only one .SETDIR attribute allowed in rule line

### **Explanation**

You have a rule with more than one .SETDIR attribute.

### **User response**

If you want Make to search for a file in a number of different directories, use the . SOURCE special target.

FSUM9432

Duplicate entry [target] in target list

### **Explanation**

The makefile has duplicate entry target in target list.

## **System action**

The command continues.

# **User response**

Edit the makefile to remove the duplicate entry from target list.

**FSUM9433** 

Duplicate entry [prereq] in prerequisite list

#### **Explanation**

The makefile has duplicate entry prereq in the prerequisite list.

#### **User response**

Edit the makefile to remove the duplicate entry from the prerequisite list.

**FSUM9434** 

Multiply defined recipe for target target

### **Explanation**

You specified more than one recipe for target in different rules, and the rules use the: operator.

Either use the: operator to handle independent recipes, or correct your makefile.

**FSUM9435** 

Empty recipe for special target target

#### **Explanation**

The special target specified requires that a recipe also be specified for it.

### **User response**

Refer to the documentation for the target and add an appropriate recipe.

**FSUM9436** 

string ignored on suffix rule [.SETDIR]

### **Explanation**

The attribute is ignored, so it cannot be applied to this suffix rule.

## **User response**

Remove the attribute from the suffix rule.

**FSUM9437** 

Imported macro `macroname' not found in environment

#### **Explanation**

make attempted to import a macro that was not present in the program environment.

## **User response**

Define the appropriate environment variable, remove the import rule, or add the . IGNORE attribute to the import rule.

**FSUM9439** 

Include file filename not found

#### **Explanation**

make couldn't find the file filename.

### **User response**

Check that the file exists, was named properly and that you have the appropriate permissions. Also check the prerequisites of the .INCLUDIRS target to make sure that it specifies the correct path.

**FSUM9441** 

Target `target' cannot mix `:' and `::' rules

#### **Explanation**

You defined a rule for *target* using the :: operator, and then followed this with another rule for target using the : operator.

#### **User response**

Either modify the second rule to use :: or remove it.

FSUM9453

library(member): Can't touch library member

Warning: The command failed when trying to touch the library member to force the modify time to the present.

### **System action**

The program continues.

### **User response**

Check the library and try again.

**FSUM9454** 

string macro not defined

## **Explanation**

You tried to execute a recipe that required the shell and either the \\*[MACRO GROUPSHELL] macro or the SHELL macro was not defined.

### **User response**

Make sure that the macro is defined properly in your makefile or startup.mk file.

**FSUM9456** 

Cannot open 'pathname'

### **Explanation**

make was unable to open a temporary file for a diversion or group recipe. You may not be able to write to your **TMPDIR** directory.

### User response

Make sure that the **TMPDIR** environment variable is set up properly, that you have the appropriate permissions in that directory and that there is space on the file system.

**FSUM9464** 

allocating buffer for backslash interpretation

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9465** 

internal error: Converting "number" format argument from wide to MB

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9466** 

internal error: unexpected return value from bs()

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9467** 

argument "arg"

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM9503

cannot open file "filename" in "cmd" command

The file named in the *cmd* command could not be opened, either because the maximum number of files was already open, or because you were not permitted to write to *file*.

### **User response**

Either simplify your script, so that it requires fewer open files, or check to ensure that you do have permission to write to the file.

FSUM9505

Warning: unknown process process\_id terminated

### **Explanation**

This process has either ended normally or was terminated by a signal. The shell issued this message because even though this process is a child of the shell, its process id is unknown to the shell.

### System programmer response

The receipt of this message generally indicates an error in fork() processing.

FSUM9514

Input read error.

# **Explanation**

While in Vi mode, the editor received an EOF as command input- which terminated the editing session. This occurs when the standard input is a file rather than a terminal and the file ends without an **exit** command.

### **User response**

Add a proper exit command to the command file.

FSUM9526

Could not change name of utmpx database to "filename"

# **Explanation**

An error occurred while attempting to change the utmpx database name to *filename*. It is possible there were not enough free system resources to allocate an internal buffer.

#### System action

Program ends.

#### User response

Double-check the name of the file or free up some system resources and reissue the command.

**FSUM9527** 

filename is not a valid utmpx file

# **Explanation**

While reading entries from the utmpx database, specified by *filename*, a value for the **ut\_type** field of the utmpx structure was out of range. See *z/OS UNIX System Services Command Reference* for more information.

## System action

Program ends.

### System programmer response

Verify /etc/utmpx is not corrupted.

### **User response**

If the file used by the who utility is the default /etc/utmpx file, then contact system programmer. If a different file was specified, then verify this file is not corrupted and in the proper format.

**FSUM9528** 

file "filename" is binary

## **Explanation**

A system error indicating the cause is displayed with this message.

FSUM9529

file "filename": line too long: limit LINE\_MAX

### **Explanation**

A system error indicating the cause is displayed with this message.

FSUM9532	can't open parser resource file "filename"
FSUM9533	disk error: cannot write temp file

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9545** 

no string given

# **Explanation**

The command tried to read *string* from the command line but there were none.

## **System action**

The command ends.

#### User response

Provide string and try again.

#### **FSUM9546**

'z' option not allowed if strings given

#### **Explanation**

The command cannot determine which strings should be chosen if both the 'z' option and the *string* argument are provided.

#### **System action**

The command ends.

#### User response

Remove *string* to read strings from [=file] or standard input.

FSUM9564

Insufficient disk space on device or Bad temporary file (read)

Yacc encountered a problem while reading a temporary file.

#### **User response**

Ensure that the disk is not full or defective.

FSUM9566

expanded length of string too long; limit char\_set\_size

### **Explanation**

You specified a string that expanded to a length greater than the number of characters in the character set. Since a given character may appear only once in the first string, you specified a character more than once in that string.

#### **User response**

Remove any repeated characters in the first string.

FSUM9567

Starting endpoint *hexnum1* does not precede the second endpoint *hexnum2* 

### **Explanation**

The starting point of a range of characters is after the end point you have indicated.

## **User response**

Reverse the start and end points of the range.

FSUM9569

Invalid character class *class* 

#### **Explanation**

You specified a character class class that is not defined in the locale indicated by LC\_CTYPE.

#### **User response**

Specify a character class that is defined in the locale indicated by LC\_CTYPE.

**FSUM9570** 

Collation string is not supported in [=equiv=]

## **Explanation**

You specified a string for *equiv* in a [=*equiv*=] expression that contained more that one character. tr accepts only a single character for the equivalence class.

#### **User response**

Specify a one-character equivalence class.

FSUM9571

syntax error in [x\*n] expression expression.

#### **User response**

Provide the missing ].

FSUM9572

[x\*0] construct may only occur once

You tried to fill the string using the [x\*0] construct more than once.

#### **User response**

Remove the second fill request.

FSUM9573

Multibyte conversion

### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9575** 

Corrupt multibyte character file "filename"

### **Explanation**

File filename contains incomplete multibyte characters.

# **System action**

The command continues.

### **User response**

Make sure that file *filename* contains complete multibyte characters.

**FSUM9581** 

memory allocation failure

## **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9585** 

Only classes [:upper:] and [:lower:] are valid as a translate result, and then only if the corresponding character class is specified

#### **Explanation**

You specified a *class* in a [:*class*: construct in *string2* that was not lower or upper, or you specified [:lower:] or [:upper:] in *string2* without specifying the other one at the corresponding spot in *string1*.

### **User response**

Specify *string2* in a form that gives an equivalent result without using the [:class:] construct, or specify [:upper:] or [:lower:] (as appropriate) at the correct point in *string1*.

FSUM9586

input file *filename* 

#### **Explanation**

A system error indicating the cause is displayed with this message.

**FSUM9587** 

command: input line too long in filename

#### **Explanation**

A line in the input file *filename* was longer than LINE\_MAX bytes.

Use cmp to compare non-text files.

#### **FSUM9588**

command: input file filename is a binary file

### **Explanation**

You specified *filename* as the input file; however, *filename* is a binary file. uniq only works with text files.

### **User response**

Specify a text file as the input file.

#### FSUM9593

dd: only one of conv=ucase and conv=lcase may be specified

## **Explanation**

You specified both ucase and lcase. These options are mutually exclusive; you can specify only one.

# **System action**

The program ends.

### **User response**

Select ucase or lcase and rerun the command.

#### FSUM9594

dd: only one of conv=block and conv=unblock may be specified

## **Explanation**

You specified both block and unblock. These options are mutually exclusive; you can specify only one.

### **System action**

The program ends.

### **User response**

Select block or unblock and rerun the command.

#### **FSUM9595**

dd: only one character set translation option may be specified

#### **Explanation**

The ascii, ebcdic, ibm, and convfile translation options are mutually exclusive. You specified more than one of these options.

### **System action**

The program ends.

#### **User response**

Select only one translation option and rerun the command.

#### **FSUM9602**

unable to create tempfile name

A temporary file could not be created. A system error indicating the cause follows this message. The problem is usually caused by lack of space on the output device, or lack of appropriate permissions to create the file.

## **System action**

The program ends.

### **User response**

Refer to the system error message and take appropriate action.

#### **FSUM9603**

output path or file name too long

## **Explanation**

The pathname of the temporary file exceeds system limits.

## **System action**

The program ends.

## **User response**

Because the name of the temporary file is based on the pathname of the input file, shorten the pathname of the input file by renaming it and/or moving it to a directory with a shorter name.

FSUM9604

file " filename " already exists; not overwritten

# **Explanation**

The output file " filename " already exists and will not be overwritten.

# **System action**

The program ends.

# User response

Remove or rename "filename".

#### **FSUM9620**

File read error

## **Explanation**

ed experienced a problem reading the file. A system error message follows.

### **System action**

The program continues.

#### **User response**

Respond to the accompanying system error message.

**FSUM9630** 

Number " num " not in range min.max

The number you specified, " num ", is not within the allowable range of numbers.

### **System action**

The program ends.

### **User response**

Specify a number in the range min and max.

#### FSUM9631

Number " num " not in range min.max

## **Explanation**

The number you specified, " num ", is not within the allowable range of numbers.

### **System action**

The program ends.

## **User response**

Specify a number in the range *min* and *max*.

#### FSUM9632

Number " num " not in range min.max

### **Explanation**

The number you specified, " num ", is not within the allowable range of numbers.

#### **System action**

The program ends.

#### **User response**

Specify a number in the range min and max.

#### **FSUM9636**

System does not support querying the set of character sets

#### **Explanation**

The -l option is not supported.

#### **System action**

The program ends.

#### **User response**

Consult your system programmer if this is a needed feature.

#### **FSUM9637**

Warning: multibyte locale not supported

## **Explanation**

lex currently does not support multibyte locales. If you are attempting to run lex in a multibyte locale, you may experience additional errors. See *z/OS UNIX System Services Command Reference* for more information.

#### **FSUM** messages

### **System action**

The program continues.

#### **User response**

Run lex in POSIX locale.

FSUM9638

Number " num " not in range min.max

### **Explanation**

The number you specified, " num ", is not within the allowable range of numbers.

## **System action**

The program ends.

## **User response**

Specify a number in the range min and max.

**FSUM9639** 

Number " number " not in range 0 ... unsigned long max

## **Explanation**

Input data fell outside of the accepted range, because you attempted to enter a negative number.

### System action

The program ends.

#### **User response**

Enter only non-negative numbers.

FSUM9661

pipe buffer

# **Explanation**

While attempting to pipe a message through a command, mailx was not able to allocate enough memory.

### System action

The program continues.

#### **User response**

Free up system resources and retry the command.

**FSUM9666** 

No messages satisfy: subcommand line

### **Explanation**

No messages in the mailbox matched the subcommand given.

# **System action**

The program continues.

#### **FSUM9667**

No applicable messages about " subcommand line "

## **Explanation**

No messages in the mailbox had a subject line that matched the one given by the user.

## **System action**

The program continues.

**FSUM9668** 

No applicable messages from " subcommand line "

# **Explanation**

The system could not find a mail message from the specified user.

# **System action**

The program continues.

**FSUM9669** 

Unrecognized scrolling command " command "

## **Explanation**

The user gave a scrolling command that was not valid.

## **System action**

The program continues.

## **User response**

To scroll forwards, use '+' or "z+". To scroll backwards, use '-' or "z-".

**FSUM9673** 

pathname: Nonportable character 'c' (xx) found.

### **Explanation**

pathname contains the character c (represented in hex by xx), which is not in the portable filename character set.

# System action

The program ends.

#### **User response**

Rename pathname so that it does not include this character.

**FSUM9674** 

pathname: Nonportable byte xx found.

#### **Explanation**

pathname contains the non-printable character with hex byte value of xx, which is not in the portable filename character set.

# System action

Rename pathname so that it does not include this character.

#### **FSUM9679**

Existing file " filename " exists; it will not be overwritten

### **Explanation**

The -k (do not overwrite) option was specified for a pax restore, and pax has determined that *filename* already exists on the file system. The version of *filename* in the archive will not be restored.

## System action

The program continues.

### **User response**

This is an informational message. No response is required.

FSUM9681

n.illegal character sequence(s) for codeset extracting file " filename "

### **Explanation**

While *filename* was being extracted, n characters could not be translated from and to codesets specified on the "-o to=" option. The n characters are left untranslated.

## **System action**

The program continues.

## User response

Verify that the *filename* as stored in the archive is not corrupted, and use the iconv utility to verify that the file can be successfully converted in its original form.

#### FSUM9682

Cannot append to compressed archive

#### **Explanation**

The -a (append) option cannot be used on a compressed archive.

# **System action**

The program ends.

#### User response

To add a file to the end of a compressed archive, you can first use the *uncompress* utility to uncompress the archive, and later use the *compress* utility to recompress the archive.

FSUM9684

Error: -o "option string": Invalid syntax

#### **Explanation**

The -o option was used with an invalid syntax near option string.

## **System action**

Correct the -o syntax near option string.

**FSUM9696** 

!write error on file "filename"

### **Explanation**

An error occurred writing to *filename*. A system error message that indicates the reason for the error follows this message. The problem is usually caused by lack of space on the output device, or lack of appropriate permissions to write the file.

### **System action**

The program ends.

### **User response**

Refer to the accompanying system error message and take appropriate action.

**FSUM9697** 

Badly formed sort key position " position "

## **Explanation**

The key position was not specified correctly.

# **System action**

The program ends.

# **User response**

Check the format and try again.

**FSUM9698** 

Must specify number in " -option "

#### **Explanation**

Only numeric input data is accepted.

#### **System action**

The program ends.

#### **User response**

Use proper numeric data and try again.

**FSUM9700** 

too many key field positions specified

#### **Explanation**

sort is limited in the number of key positions that can be specified. See z/OS UNIX System Services Command Reference for more information.

## **System action**

#### **FSUM** messages

#### **User response**

Use fewer key fields.

#### FSUM9701

key value in "string" out of bounds

### **Explanation**

The key value must be between 1 and LINEMAX.

## **System action**

The program ends.

## **User response**

Change the key value.

FSUM9702

invalid key specification " key "

## **Explanation**

If you specify a key using m.n notation, you cannot specify 0 in the n position.

## **System action**

The program ends.

## **User response**

Respecify the command using proper key syntax. See <u>z/OS UNIX System Services Command Reference</u> for more information.

**FSUM9704** 

file " filename ": no newline at end of file

# **Explanation**

The file did not end in a newline character. A newline character was added.

# **System action**

The program continues.

### **User response**

To avoid this message in the future, add a newline to the end of the file.

**FSUM9705** 

file " filename ": line too long: limit max -- truncated

### **Explanation**

The line exceeded the allowed length, and as a result was truncated. This could be due to a missing newline character.

# **System action**

The program continues.

To avoid this message in the future, make sure the line length does not exceed the stated limit and that the file is not missing newline characters.

FSUM9707

file "filename": line linenumber: non-unique key in record: record

### **Explanation**

The field selected is not suitable as a key field because its values are not unique for each record.

## System action

The program ends.

### User response

Select a different key field and try again.

**FSUM9708** 

file "filename": line linenumber: not ordered properly at: record

### **Explanation**

The fields of the given record were apparently out of sequence in comparison with previous records.

# **System action**

The program ends.

## **User response**

Check for missing field(s), or reorder the given record to match the previous records.

FSUM9710

!temporary file error "filename"

### **Explanation**

crontab was unable to open the named temporary file. This could be due to insufficient free storage, or a problem with the /tmp directory.

### **System action**

The program ends.

#### **User response**

Make sure that /tmp exists and is not full, try freeing up system resources, and retry the command.

**FSUM9712** 

Upper/lower case conversion must be specified in the same relative positions

#### **Explanation**

The upper or lower character class specified in *string2* does not correspond to the opposite lower or upper class specified in *string1*.

## **System action**

Change the position of the upper or lower character class in *string2* to correspond with the lower or upper character class in *string1*.

FSUM9771

string: cannot use TCP device with cu.

## **Explanation**

A TCP Device was specified for this system. cu cannot connect to another system over the TCP/IP network.

## **User response**

Use another device type.

**FSUM9835** 

initialization failed.

# **Explanation**

Common initialization for uucp commands failed, due to an error in reading the uucp configuration file.

### **User response**

Make sure the uucc command has been run to create the uucp configuration file. See the uucc command description.

FSUM9922

internal execution tree error at " string "

### **Explanation**

awk encountered an error at the named step.

# **System action**

The program continues in an error state and may end later.

#### **User response**

See z/OS UNIX System Services Command Reference for more information on awk.

**FSUM9926** 

error reading file

## **Explanation**

An unspecified error occurred in trying to read the file. A system error message that explains the error follows this message.

# **System action**

The program continues.

#### **User response**

Respond to the system error message.

**FSUM9927** 

error splitting record: line

# **Explanation**

awk encountered a syntax error on the given line.

670 z/OS: z/OS UNIX System Services Messages and Codes

The program continues.

#### **User response**

Correct the error and retry. See *z/OS UNIX System Services Command Reference* for more information.

#### FSUM9928

invalid wide character hex character code

## **Explanation**

awk encountered a character that was not a valid wide character.

# System action

The program continues.

## System programmer response

Follow local procedures for reporting a problem to IBM.

#### **User response**

Contact your system programmer.

FSUM9942

" argument " ignored, same basename as " argument ".

## **Explanation**

Duplicate arguments are not allowed.

#### **System action**

The program continues.

### **User response**

To avoid this message in the future, remove the duplicate argument.

#### **FSUM9943**

file(s) contain a character outside the domain of the collating sequence

#### **Explanation**

One or more characters in the file(s) has an incorrect character, based on information in the LC\_COLLATE category of the current locale.

#### **System action**

The program continues.

#### **User response**

Review the file(s) for incorrect characters (see LC\_COLLATE).

### **FSUM9948**

Warning: useless variables:

## **Explanation**

The listed variables are either redundant or not used.

The program continues.

## **User response**

Review your code to see if the listed variables can be eliminated, or if the code that uses them is missing.

FSUM9949

invalid character "character"

## **Explanation**

awk encountered a character that it did not recognize as alphanumeric, whitespace, or a special character to awk (such as a metacharacter).

# **System action**

The program ends.

## **User response**

Check your input for characters that are not valid, and check that the codeset of the input data matches the codeset of the shell environment.

FSUM9950

input lines truncated - result questionable

# **Explanation**

One or more input lines are longer than grep can handle, grep assumes that the file it is searching has lines terminated by newline characters. When no newline character is found, the line is either truncated or split into multiple lines. A common cause of this message is the use of a binary file as input to the grep command.

# **System action**

The program continues. This message does not affect the exit status.

# **User response**

Shorten the line or lines, if possible. Do not use grep to search binary files.

**FSUM9952** 

history file \$HISTFILE " file "

#### **Explanation**

The z/OS shell command history file specified by the HISTFILE variable could not be opened.

## **System action**

The shell continues to run with the default history file: \$HOME/.sh\_history.

#### User response

Take appropriate action based on the specific error description at the end of this message.

FSUM9954

bad month "month number"

# **Explanation**

Months range from 1 to 12.

The program ends.

#### **User response**

Enter again with a valid month number.

FSUM9955

invalid year "yeαr"

## **Explanation**

Years range from 1 to 9999.

## **System action**

The program ends.

## **User response**

Enter again with a valid year.

**FSUM9956** 

bad month "month"

## **Explanation**

The month name, spelling, or abbreviation was incorrect.

# **System action**

The program ends.

#### **User response**

Check the spelling of the month, or use the first 3 letters of the month name as an abbreviation.

**FSUM9988** 

!cannot determine PATH\_MAX

# **Explanation**

The program was unable to get the size limit for filenames (including their directory path) from the system.

## System action

The program ends.

#### System programmer response

Follow local procedures for reporting problems to IBM.

#### **User response**

Contact your system programmer.

**FSUM9989** 

invalid queuename 'queuename'

#### **Explanation**

queue name must be a single-byte character long, and must not be a space, tab, newline, or NULL.

#### FSUM9991

#### time specified has already expired

# **Explanation**

You specified a time that was in the past.

#### **User response**

Reissue the command with a correct time.

#### FSUM9992

#### must run as root, and be run by root

# **Explanation**

cron can only be started by a superuser. See z/OS UNIX System Services Command Reference for more detailed information.

## System action

The program ends.

## **User response**

Contact your system administrator to start cron.

#### **FSUM9993**

cron already running, pid # pid number

## **Explanation**

You may only start cron once, and it is already running.

# **System action**

The cron that is already running continues to run.

#### **FSUM9994**

cron already running

#### **Explanation**

You may only start cron once, and it is already running.

## **System action**

The cron that is already running continues to run.

#### **FSUM9995**

bad format in queuedefs

#### **Explanation**

There is a bad format in the queuedefs file. The queue format is quename.#j#n#w, where quename is a single character and # is a numeric value followed by a letter: j for the maximum number of jobs, n for null value, or w for wait to reschedule.

# **System action**

The program ends.

# **User response**

Check the queuedefs file for errors. See z/OS UNIX System Services Command Reference for more details.

674 z/OS: z/OS UNIX System Services Messages and Codes

#### FSUM9996

#### insufficient permission for -u

## **Explanation**

The -u option can only be used by a superuser.

# **System action**

The program ends.

#### FSUM9997

You are not authorized to use cron. Sorry.

## **Explanation**

Either your user ID is not in cron.allow, or it is in cron.deny.

## **User response**

Contact your system administrator.

#### **FSUM9998**

can't remove your crontab file

# **Explanation**

crontab was unable to remove the crontab file.

# **System action**

The program ends.

## **User response**

Check the permissions on the crontab file and verify that write permission has been granted.

#### FSUMA003

Unexpected character found in line: line

## **Explanation**

crontab was expecting to find either a valid number or an '\*' character followed by a non-blank (space or tab) character.

# **System action**

The program continues.

#### **User response**

Check the input line. See z/OS UNIX System Services Command Reference for the correct format.

#### FSUMA004

Number out of bounds in line: line

#### **Explanation**

crontab encountered a number in the input line that is outside of the allowed range.

# System action

The program ends.

Check the input line. See z/OS UNIX System Services Command Reference for the correct format.

FSUMA005

Missing command on line: line

# **Explanation**

crontab was expecting to find a command on the given input line and failed to detect one.

# **System action**

The program ends.

## **User response**

Check the input line for incorrect format.

FSUMA007

Warning: string already defined in filename

## **Explanation**

A duplicate identifier was found in the given file.

## **System action**

The program continues.

FSUMA008

DLL in use

# **Explanation**

The system is unable to run the program while the DLL is in use by another program or another instance of this program.

# **System action**

The program ends.

# User response

Make sure diff isn't running in a background process (use ps to detect this). If it is, either use the kill command to end it or use the fg command to bring it to the foreground. If the problem persists, contact your system administrator.

FSUMA009

filename: Not a directory

## **Explanation**

dircmp can only be used to compare directories.

#### **System action**

The program ends.

#### **User response**

If you are comparing files, use diff or cmp; otherwise, verify that both arguments todircmp are directories.

FSUMA051

filename: not executable, object, or library format

## **Explanation**

The input to the nm command must be a single executable file, a single object file or an archive library of object files.

# **System action**

The program ends.

## **User response**

Specify the appropriate type of file as input to nm and execute the command again.

FSUMA081

database file " file "

# **Explanation**

The program was unable to open the named file for reading.

# **System action**

The program continues.

## **User response**

Check to make sure the file exists and that you have permission to read it.

FSUMA083

command: Unknown terminal "term"

## **Explanation**

The terminal type *term* could not be found in the terminal database.

#### **User response**

Check that the TERM environment variable is set correctly. and that an entry exists in the terminfo database for that terminal type.

FSUMA084

Multibyte conversion error.

#### **Explanation**

An error occurred in converting between types wide character and multibyte. It is possible that an incorrect multibyte character was encountered.

#### **User response**

Check the data for incorrect multibyte characters, and try again.

FSUMA093

write error on standard output

#### **Explanation**

The program was unable to write to standard output.

# **System action**

The program ends.

## System programmer response

Follow local procedures for reporting problems to IBM.

#### **User response**

Contact your system programmer.

#### FSUMA094

file is not a normal file--can't patch.

## **Explanation**

You attempted to patch a file that is not a regular file.

# System action

The program ends.

## **User response**

Make sure there were no typos in the filename, then check the file itself for errors.

#### FSUMA096

Not enough memory to try swapped hunk! Assuming unswapped.

## **Explanation**

patch was unable to allocate memory from the system. This may be due to insufficient storage space in the system.

## **System action**

The program continues.

#### **User response**

Free up system resources and retry the command.

#### FSUMA099

Hunk *number* failed at *line number* 

# **Explanation**

patch was unable to process the given hunk. Unless you specify otherwise, those hunks that failed will be saved in a file in the current directory.

## System action

The program continues.

#### **User response**

It is possible that the patchfile was applied to the wrong file. Double-check patch files, source files, and any reject files that were created to ensure proper order.

#### FSUMA104

Ran out of memory using Plan A--trying again...

# **Explanation**

patch was unable to allocate enough memory to perform an action.

The program continues, attempting to apply the remaining patches (hunks) from the file.

#### FSUMA107

You may not change to a different patch file.

# **Explanation**

Only one patch file may be used per patch.

# **System action**

The program continues.

## **User response**

See z/OS UNIX System Services Command Reference for more information.

#### FSUMA108

Unable to change directory to 'directory'

# **Explanation**

The directory you specified may not exist; or you may have insufficient permissions to access it.

## **System action**

The program continues.

## **User response**

Double-check the directory path and its permissions.

#### FSUMA110

Fatal internal error in abort\_hunk()

### **Explanation**

While attempting to output information from a failing hunk, patch encountered a character it did not recognize.

# **System action**

The program ends.

#### **User response**

Check the patch file for corruption or truncation. Also check that the codeset in which the patch file is encoded matches that of the current environment.

#### FSUMA111

Out-of-sync patch, lines *starting line*, *ending line* --mangled text or line numbers, maybe?

#### **Explanation**

While attempting to apply the current hunk, patch encountered an error.

# **System action**

The program ends.

Check the patch file for corruption.

#### FSUMA112

patch: misordered hunks! output will be garbled.

## **Explanation**

A problem arose with the patch file (a diff file): patch could not properly match a line in the patch file with the file being updated.

# **System action**

The program continues.

## **User response**

Restore the file from backup, and retry.

#### FSUMA116

This appears to be the wrong kind of patch.

## **Explanation**

The diff type you specified did not match the actual type of the patch.

# **System action**

The program continues.

## **User response**

Respecify the diff type (context, ed, or normal) so that it matches the actual type of the file. For more information, see *z/OS UNIX System Services Command Reference* under "diff" and "patch".

#### FSUMA130

Unexpected end of file in patch.

# **Explanation**

While processing a segment of the patch file, patch ran across an unexpected end of file. The patch file could be corrupted.

# **System action**

The program ends.

#### User response

Recreate the patch file, restore the file to be updated from backup, and rerun the program.

#### FSUMA131

Unexpected end of hunk at line line number.

#### **Explanation**

patch came across the end of the current hunk (segment) of the patch file sooner than expected.

# **System action**

Examine the patch file for errors.

#### FSUMA132

Unexpected \*\*\* at line line number: line

## **Explanation**

patch came across the start or end of a hunk or segment sooner than expected.

## **System action**

The program continues.

## **User response**

Examine the patch file for errors.

FSUMA133

Duplicate "---" at line *line number* --check line numbers at line *line number*.

## **Explanation**

patch came across the start or end of a hunk or segment sooner than expected. This may be due to an extraneous "---" marker.

# **System action**

The program continues.

# **User response**

Examine the patch file for errors.

FSUMA134

Premature "---" at line *line number* --check line numbers at line *line number*.

## **Explanation**

The "---" indicator of the next section of the patch file was encountered sooner than expected.

## **System action**

The program continues.

## **User response**

Check the line numbers specified; the patch file may have been edited or otherwise corrupted.

FSUMA135

Overdue "---" at line *line number* --check line numbers at line *line number*.

#### **Explanation**

The "---" indicator of the next section of the patch file was expected and not found.

# **System action**

Check the line numbers specified; the patch file may have been edited or otherwise corrupted.

#### FSUMA136

Hunk too large (quantity lines) at line line number: line

## **Explanation**

The current hunk exceeds the maximum allowable hunk size.

## System action

The program continues.

#### System programmer response

Follow local procedures for reporting problems to IBM.

#### **User response**

Consult your system programmer.

#### FSUMA137

No --- found in patch at line line number

## **Explanation**

The "---" marker, which marks the beginning of replacement text was expected and not found.

## System action

The program continues.

#### **User response**

Examine the patch file for corruption.

## FSUMA139

Replacement text or line numbers mangled in hunk at line *line number* 

## **Explanation**

The patch file may have been corrupted or applied in the reverse order.

#### **System action**

The program continues.

#### **User response**

Examine the patch file for corruption.

## FSUMA140

Unexpected end of file in patch at line line number

#### **Explanation**

patch encountered the end-of-file marker before it had finished processing the patch file.

# **System action**

Check the patch file for corruption or truncation.

#### FSUMA144

#### Not enough memory to swap next hunk!

# **Explanation**

This message occurs only when you use the -R option on the command line. patch was unable to allocate memory to swap a hunk to/from the patchfile.

# **System action**

The program continues.

## **User response**

To avoid this problem in the future, try freeing up system resources.

#### FSUMA145

Malformed patch at line line number: line

#### **Explanation**

patch was expecting to find a digit and did not find one.

# **System action**

The program ends.

## User response

Check the patch file for errors.

#### FSUMA157

at ".so filename ", file nesting level too deep

#### **Explanation**

You attempted to push more than 64 files onto the stack.

# **System action**

The program ends.

#### **User response**

Try breaking up the **spell** command so that you do not need to examine more than 64 files at one time.

#### FSUMA162

hash table

# **Explanation**

The system was unable to allocate storage for the hash table.

# **System action**

The program ends.

#### **User response**

Free up system resources, or add more main storage.

#### FSUMA163

hash file "file"

# **Explanation**

The program was unable to open the named file.

# **System action**

The program ends.

# **User response**

Check the file permissions. If the failure persists, contact your system administrator.

#### FSUMA164

hash file "file" write

# **Explanation**

The program was unable to write to the named file.

# **System action**

The program ends.

#### **User response**

Refer to the system error message that accompanies this message.

#### FSUMA176

Incomplete multibyte sequence on command line

# **Explanation**

The multibyte character sequence specified in the input or output translation string is incomplete.

# **System action**

The program ends.

# **User response**

This is most likely due to a missing \SI (shift in) character following a \SO (shift out).

#### FSUMA186

Internal error: wcfputs().

#### **Explanation**

In attempting to write a wide character string to a stream, an internal error occurred during conversion to multibyte.

# **System action**

The program continues.

## System programmer response

Follow local procedures for reporting a problem to IBM.

Consult your system programmer, or follow local procedures for reporting a problem to IBM.

#### FSUMA187

Failed to expand words.

## **Explanation**

vi was unable to expand the %, #,! commands on the input line.

## **System action**

The program continues.

#### System programmer response

None.

#### **User response**

Check the input line for mistyped arguments or files.

#### FSUMA194

Problem creating pathname (path)

## **Explanation**

This is a system error that may have been caused by either of the following situations (though other causes are possible): 1. pathname length exceeds PATH\_MAX. 2. insufficient memory to create the pathname.

# **System action**

The program ends.

## System programmer response

Follow local guidelines for reporting the problem to IBM.

#### **User response**

Contact your system programmer.

#### FSUMA196

temporary file error

#### **Explanation**

wall was unable to open a temporary file. There could be insufficient system resources, for example, not enough storage or open file pointers.

#### **System action**

The program ends.

#### **User response**

Free up system resources and try again if necessary.

#### FSUMA197

write error on temporary file

#### **FSUM** messages

#### **Explanation**

An error occurred while the program was attempting to write to a temporary file.

## **System action**

The program ends.

# **User response**

Make sure that system resources have not been used up, as insufficient free storage could cause this problem.

#### FSUMA860

Recursive alias "alias" not expanded

# **Explanation**

This alias was part of another alias, and exceeded the maximum recursive depth allowed.

# **System action**

The program continues.

## **User response**

Redefine the alias so that an alias name is not part of the definition.

#### FSUMA872

cannot open file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

FSUMA873

!cannot create or open file for writing " pathname "

### **Explanation**

" pathname " could not be opened. A system error indicating the cause follows this message. The problem is usually caused by lack of space on the output device, or lack of appropriate permissions to create the file.

# **System action**

The program ends.

#### **User response**

Refer to the system error message and take appropriate action.

FSUMA874

csplit argument must be one of: /regex/[+-offset] regular expression,
%regex%[+-offset] non copied
regular expression,
number line number,
{number} repetition count for
previous argument

# **Explanation**

You entered a csplit argument that did not look like a regular expression, line number, or repeat count.

Check the syntax of your command line, correct any mistakes, and reenter it.

#### FSUMA875

Badly formed regular expression "regexp"

#### **Explanation**

You specified a regular expression that did not conform to the rules for regular expressions.

## **User response**

Correct the regular expression.

FSUMA876

invalid number (num) specified with -n option (max max allowed)

## **Explanation**

The number num that was specified for the -n option exceeds the allowable value max.

# **System action**

The program ends.

## **User response**

Respecify a number that is less than or equal to max.

FSUMA877

!read error on file " pathname " at line n

# **Explanation**

An error occurred in file " pathname " at line n that prevented the file from being read. A system error indicating the cause follows this message.

## **System action**

The program ends.

## **User response**

Refer to the system error message and take appropriate action.

FSUMA878

file " pathname ", line n: contains binary data

#### **Explanation**

" pathname " at line n contains data that is not text. This program requires text data.

# **System action**

The program ends.

#### **User response**

Verify that "pathname" is a text file.

FSUMA879

file " pathname ", line n: line length exceeds limit of max

#### **FSUM** messages

## **Explanation**

The length of line *n* in " *pathname* " exceeds the maximum allowed value *max*.

# **System action**

The program ends.

# **User response**

Because the name of "pathname" is based on the pathname of the input file, shorten the pathname of the input file by renaming it and/or moving it to a directory with a shorter name.

FSUMA882

" string " : Premature end of file

# **Explanation**

csplit encountered the end of file before it was expected. This usually indicates that the last line of the input file is not terminated by a line-end character.

# System action

The program ends.

# **User response**

csplit operates on text files. Verify that the file consists of complete text lines.

FSUMA883

" string " : Out of range

# **Explanation**

This is most likely the result of specifying a negative offset from a regular expression that resulted in a negative number of lines to output.

# **System action**

The program ends.

# **User response**

Reattempt the command with a smaller negative offset, or change the regular expression.

FSUMA884

!memory allocation error

# **Explanation**

You ran out of memory.

## System action

The program ends.

#### **User response**

Obtain more memory.

FSUMA885

find: could not execute cpio utility

## **Explanation**

popen failed to execute cpio. Another message is displayed describing the error.

## **System action**

The program ends.

#### **User response**

Look up the associated error message.

FSUMA888

Nice priority must range from num1 to num2

## **Explanation**

You specified a *priority* value that was not in the range *num1* to *num2*.

#### **User response**

Specify a priority value that falls in the given range.

FSUMA891

No such user as " user "

## **Explanation**

The user specified with the -u option is not known on this system. Either the user name or the numeric user ID is not defined in the user database.

## **System action**

The command ends.

#### **User response**

Specify a valid user name or user ID.

FSUMA893

renice nice\_val [-v] [-p] pid ... [-g gid ...] [-p pid ...] [-u user ...]

#### **Explanation**

Usage messages display the correct syntax for a command that you may have entered incorrectly.

FSUMA894

renice nice\_val [-v] -g gid ... [-g gid ...] [-p pid ...] [-u user ...]

#### **Explanation**

Usage messages display the correct syntax for a command that you may have entered incorrectly.

FSUMA895

renice nice\_val [-v] -u user ... [-g gid ...] [-p pid ...] [-u user ...]

#### **Explanation**

Usage messages display the correct syntax for a command that you may have entered incorrectly.

FSUMA897

pathchk: warning: pathconf("pathname", varcode) returns 'syserror'.
Using varcode2 = rc

## **Explanation**

An error occurred executing the C-runtime function pathconf() on *pathname* using varcode= *varcode*.

The program ends.

## **User response**

Refer to the system error message and take appropriate action. Contact your system programmer for additional help.

FSUMA902

can't access your terminal

## **Explanation**

The invoking process does not have a controlling terminal.

## **User response**

When running ps without a controlling terminal, you must specify one of the -G, -g, -p, -t, -U, or -u options to identify the processes on which ps is to report.

FSUMA903

process table

## **Explanation**

A system error indicating the cause is displayed with this message.

FSUMA904

no matching processes found.

## **Explanation**

ps did not find any find any processes which matched the specified search criteria.

#### **User response**

Confirm the command options for ps.

FSUMA905

badly constructed format string "format"

#### **Explanation**

The output format string was not correct.

#### **User response**

Check the description of ps in z/OS UNIX System Services Command Reference for a list of possible format specifications.

FSUMA906

parsing format string

#### **Explanation**

A system error indicating the cause is displayed with this message.

FSUMA907

out of memory

#### **Explanation**

There were not enough free system resources to allocate the required space.

Free up more resources and try again.

#### FSUMA909

bad numeric ID at "-command option"

## **Explanation**

You specified a numeric identifier for a process, group, or session that was not a valid number.

## **User response**

Make sure that all numeric IDs are valid numbers.

FSUMA910

unknown user ID at "-u command"

## **Explanation**

You specified an unknown login name or a bad user ID as an argument to the -u option.

## **User response**

Check the arguments to the -u option carefully.

FSUMA911

undefined function

## **Explanation**

The command is identified as an undefined function. Possible causes: 1. The command name was marked with the "typeset -u" or "autoload" command, and the definition was not found in FPATH. 2. A filename matching the command name was found in FPATH, but the file did not contain a function definition of that name.

# **System action**

The command ends.

#### **User response**

Define the function, or set the FPATH variable to include a directory that contains a file with the command name. The contents of this file must include a function definition for the command name.

FSUMA912

Cannot set locale: The internationalization variable settings are invalid.

#### **Explanation**

The shell called the "setlocale(LC\_ALL, "")" function, which failed. This is probably a result of an invalid or corrupted locale file.

FSUMA917

job control disabled

## **Explanation**

You attempted to use the fg or bg command when set-o monitor (or set -m was not set.

#### **User response**

Turn on monitor mode with set -omonitor or set-m.

FSUMA921

Option -option argument missing

#### **FSUM** messages

#### **Explanation**

You did not provide an argument for -option.

#### **User response**

Provide the missing argument.

#### FSUMA922

-1 number too large

## **Explanation**

You specified the -1 option with a numeric argument that was greater than 1023.

## User response

Specify an argument to the -1 option that is less than 1024.

FSUMA923

-n number too large

## **Explanation**

You specified the -n option with a numeric argument that was greater than 1023.

## **User response**

Specify an argument to the -n option that is less than 1024.

FSUMA924

!could not fork()

# **Explanation**

xargs could not fork a new process. A system error indicating the cause is displayed with this message.

# **System action**

The program ends.

## **User response**

Take appropriate action based on the reason code.

FSUMA925

path: command not found

#### **Explanation**

The command *path* cannot be found, or you do not have permission to access it.

# **System action**

The program ends.

#### **User response**

Verify that you spelled the command correctly and that you have the correct permission to access it.

FSUMA930

command: Unknown option -option

## **Explanation**

You specified an option that is not valid for this command.

## **User response**

Check z/OS UNIX System Services Command Reference for a list of options.

#### FSUMA932

argument: input file can't be a directory

## **Explanation**

Directories may not be used as input source.

# System action

The program ends.

## **User response**

Specify a non-directory file as input source.

#### FSUMA934

Warning: increment number changed to number

## **Explanation**

The increment specified on the **nice** command resulted in a nice value that was not valid. The increment was adjusted to result in a valid **nice** value.

# System action

The command continues.

## **User response**

No action is needed. To avoid this warning, specify a priority increment that, when added to the current nice value, results in a valid **nice** value (0-39).

#### FSUMA935

command not executable

#### **Explanation**

The command specified as an argument on the nice command could not be run. A specific error description follows this message.

# System action

The nice command ends.

#### **User response**

Specify an executable command as an argument on the nice command.

#### FSUMA957

translation code code not valid unsigned char

#### **Explanation**

The value of *code* fell outside the range of values for an unsigned character.

#### **FSUM** messages

## **System action**

The program continues.

#### **User response**

Change either the variable type or the value assigned to it.

#### FSUMA958

duplicate translation on 'character'

## **Explanation**

During the processing of a new translation table, a character was redeclared.

# **System action**

The program continues.

## **User response**

Remove the extraneous declaration.

#### FSUMA959

undefined start condition 'name'

## **Explanation**

A <start state&gt; was used in a pattern, but lex was unable to find it in the list of declared start states.

# System action

The program continues.

#### **User response**

Declare the start state, or correct the name if it is misspelled.

#### FSUMA960

bad {NAME} syntax

# **Explanation**

lex encountered a character in a {NAME} that was not an alphabetic, numeric, or '\_' (underscore). There could be a missing '}' at the end of a previous declaration.

# **System action**

The program continues.

#### **User response**

Remove the illegal character(s) from the {NAME} declaration or add the missing '}'.

#### FSUMA961

definition not defined

## **Explanation**

After seeing a {definition}, lex was unable to find it in the list of declared substitutions.

# **System action**

Replace the declared substitution, or define it in the definition section.

#### FSUMA962

#### nested { definition } expansion

# **Explanation**

You may have attempted to place a call to a macro with the definition of that macro.

## **System action**

The program continues.

## **User response**

Remove the recursive macro call, or change the macro to a function that can be called recursively.

#### FSUMA963

?possibly non-portable character class

# **Explanation**

The defined character class may not be fully portable because of the inclusion of system or locale-specific characters, numbers, or symbols.

# **System action**

The program continues.

## User response

If you want to find a more portable (POSIX-defined) definition of the desired character class, consult <u>z/OS UNIX</u> System Services Command Reference or a lex manual.

#### FSUMA964

#### **Incomplete %{ declaration**

#### **Explanation**

lex could not find the trailing %}, which needs to be the first and only thing on a line.

## **System action**

The program ends.

#### User response

Add or correct the missing %}.

#### FSUMA965

#### Too many start conditions

#### **Explanation**

During processing of the definition section, the number of *start conditions* exceeded the size of lex's static internal table. The default number of start conditions is 100.

# **System action**

The program ends.

Use fewer start conditions.

FSUMA966

can't determine look ahead

## **Explanation**

lex ran into a conflict in lookahead tokens, and did not know how to resolve it.

## **System action**

The program continues.

## User response

Simplify or expand the grammar rules to remove the conflict.

FSUMB031

?, \*, + or - not preceded by valid regular expression

## **Explanation**

You specified a regular expression that contained a ?, \*, +, or - which was not preceded by a valid regular expression.

#### **User response**

Make sure that every unquoted ?, \*, +, or - in the regular expression is preceded by a valid regular expression.

FSUMB039

error setting termios attributes

# **Explanation**

A system error indicating the cause is displayed with this message.

FSUMB040

unknown mode string

#### **Explanation**

You specified an unknown stty operand.

### **User response**

Check the description of stty in z/OS UNIX System Services Command Reference for a list of valid stty operands.

FSUMB041

Mode " mode " not supported in this window

#### **Explanation**

The system was unable to set the number of rows in this window.

# System action

The program ends.

FSUMB042

missing number after string

#### **Explanation**

You did not specify a numeric value as the argument of operand.

696 z/OS: z/OS UNIX System Services Messages and Codes

Supply an appropriate number as the argument of operand.

FSUMB043

internal error 1

## **Explanation**

An internal error occurred in stty while trying to set the stty modes.

# **System action**

The command ends.

## **User response**

Follow local procedures for reporting problems to IBM.

FSUMB045

failed to get termios attributes

# **Explanation**

A call to tcgetattr() failed to return the necessary information.

## **User response**

Contact your system programmer.

FSUMB046

missing character after "command"

# **Explanation**

You did not specify a control character as the argument of command.

## **User response**

Supply an appropriate argument for command.

FSUMB047

badly formed operand character "char"

## **Explanation**

You specified operand as the argument to command but operand is not a valid control character.

#### **User response**

Specify a valid control character.

FSUMB048

missing speed after "command"

# **Explanation**

You did not specify a baud rate with the **ispeed** or **ospeed** operand.

#### **User response**

Supply a valid baud rate.

FSUMB049

argument "arg" not valid after operand

#### **Explanation**

You specified an invalid baud rate, arg, after the **ispeed** or **ospeed** operand.

## **User response**

Contact your system programmer or check your reference manuals for a list of baud rates supported by your machine.

#### FSUMB077

Detected circular dependency using [target]

## **Explanation**

After expansion, a target depends upon itself. Make does not permit this.

## **User response**

Modify the makefile to eliminate the circular dependency.

FSUMB082

result of substitution too long

## **Explanation**

The resulting filename after the substitution specified on the "-s" option exceeds the maximum filename length allowed.

# **System action**

The program continues.

# User response

Use a shortened substitution string.

FSUMB083

Unknown option "+option"

#### **Explanation**

You specified an option that is not valid for this command.

#### **User response**

Check z/OS UNIX System Services Command Reference for a list of options.

FSUMB084

Option "option" requires an argument

#### **Explanation**

You specified an option that is not valid for this command.

## **User response**

Check z/OS UNIX System Services Command Reference for a list of options.

FSUMB085	Invalid XQT file format - 'U' line not found (jobname)
FSUMB091	literal newline characters are not allowed in EREs

# **Explanation**

An attempt was made to place a newline character after the '\'.

698 z/OS: z/OS UNIX System Services Messages and Codes

The program continues.

## **User response**

Remove the literal newline from the extended regular expression.

FSUMB261

Bad list for -f, -b, or -c option [list]

## **Explanation**

You specified a list for the -f, -b, or -c option that contained non-numeric entries.

## User response

Specify a list that contains only numeric entries.

FSUMB262

Badly formed range in list [list]

## **Explanation**

You specified a list that contained a range that was not in the form: *num1* to *num2*.

## **User response**

Reenter the command line using the proper syntax for a range.

FSUMB263

Must specify "-f", "-b" or "-c" option

# **Explanation**

You did not specify any of the -f, -b, or -c options.

#### **User response**

Specify one of the three options.

FSUMB264

Bad range "num1-num2" in list

# **Explanation**

You specified a list containing the range *num1* - *num2* where *num2* was less than *num1*. Ranges must be specified with the lower value first.

#### User response

Reenter the command line, making sure to list the lower value first when specifying the range.

FSUMB265

no fields specified in list [list]

## **Explanation**

cut did not recognize anything in list as indicating a field.

#### **User response**

Check the syntax of the list and reenter the command.

FSUMB291

Invalid number "number".

#### **Explanation**

The *number* must be between the LONGLONG\_MAX and the LONGLONG\_MIN.

#### **User response**

Respecify command with an appropriate number.

FSUMB293

Invalid option character " unit\_character " in " user\_string "

## **Explanation**

The unit character unit specified by the user is invalid. Valid unit characters are b, c, k, l or m.

# **System action**

The command ends.

#### **User response**

Reissue the command with a correct unit.

FSUMB294

Argument " *unit1* " is mutually exclusive with previously specified " *unit2* " option.

# **Explanation**

The unit character *unit1* cannot be specified by the user because *unit2* was already specified. There cannot be two unit specifiers on the same command line.

# **System action**

The command ends.

#### User response

Reissue the command specifying only one unit character.

FSUMB322

Argument to -n must be numeric.

## **Explanation**

The -n option requires a numeric argument. This message occurs when a non-numeric value is detected as the argument to -n.

#### User response

Make sure that the command was entered correctly and use a numeric value for -n.

FSUMB407

submit: 'filename' Could not open file. errno=reason

#### **Explanation**

The specified file cannot be opened.

# **System action**

The command fails for the file specified in the error message.

Check the system error message displayed with this message.

FSUMB408

submit: target Not accepted by JES.

#### **Explanation**

The specified file or data set is not accepted as a JES job.

## **System action**

The command fails for the file or data set specified in the error message.

#### User response

Verify that the file or data set member is in the correct JES format and reenter the command.

FSUMB409

submit: target Could not submit empty job.

# **Explanation**

The specified file or data set is empty and cannot be submitted to JES.

## **System action**

The command fails for the file or data set specified in the error message.

## **User response**

Verify that the file or data set member contains data and reenter the command.

FSUMB410

Unknown option "-option"

### **Explanation**

You specified an option that is not valid for this command.

#### **User response**

Check z/OS UNIX System Services Command Reference for a list of valid options.

FSUMB411

submit: data set Could not allocate data set.

#### **Explanation**

The specified data set cannot be allocated.

# **System action**

The command fails for the data set specified in the error message.

#### **User response**

A system error message may have been displayed with this message. Verify that the specified data set exists.

FSUMB451

tsocmd: TSO/E command "command\_string" not found.

## **Explanation**

The specified TSO/E command cannot be found.

# **System action**

The **tsocmd** command ends.

## **User response**

Verify that a valid TSO/E command was specified, and try the request again. Note that quotes can be used around the command string to avoid shell parsing.

FSUMB452

tsocmd: Unexpected error occurred processing TSO/E command "command\_string", return code return\_code.

## **Explanation**

An unexpected error occurred while processing TSO/E command "command\_string". The associated system error messages precede this error, and the TSO/E return code was return code.

# **System action**

The tsocmd command ends.

## System programmer response

Take appropriate action based on the system error messages and return code *return\_code*.

# **User response**

Refer to <u>z/OS TSO/E Programming Services</u> for more information on the system error messages. Verify that the correct TSO/E command was entered, and try the request again. Note that quotes can be used around the command string to avoid shell parsing. If unable to resolve, contact your system programmer.

FSUMB453

tsocmd: Unexpected error occurred processing environment variable "variable name", return code return code.

#### **Explanation**

An unexpected error occurred while processing environment variable *variable\_name*. The associated system error messages precede this error, and the TSO/E return code was *return\_code*.

# **System action**

The tsocmd command ends.

## System programmer response

Take appropriate action based on the system error messages and return code return\_code.

#### **User response**

Refer to the tsocmd command description in z/OS UNIX System Services Command Reference for more information. Verify that the environment variable has been properly specified, and try the request again.

FSUMB454

tsocmd: Unexpected error occurred processing environment variable "variable name".

## **Explanation**

An unexpected error occurred while processing environment variable *variable\_name*. The associated system error messages precede this error.

## System action

The tsocmd command ends.

#### System programmer response

Take appropriate action based on the system error messages.

## **User response**

Refer to the  $\pm$ socmd command description in z/OS UNIX System Services Command Reference for more information. Verify that the environment variable has been properly specified, and try the request again.

FSUMB455

tsocmd: Data set not allocated to *DD\_name:data\_set*, return code return code.

## **Explanation**

Data set *data\_set* could not be allocated to DD name *DD\_name*. The associated system error messages precede this error, and the TSO/E return code was *return\_code*.

## System action

The tsocmd command continues.

# System programmer response

Take appropriate action based on the system error messages and return code return\_code.

#### **User response**

Refer to the tsocmd command description in <u>z/OS UNIX System Services Command Reference</u> for more information. Verify that the TSOALLOC, SYSEXEC or SYSPROC environment variable has been properly specified, and try the request again.

FSUMB456

tsocmd: Data set not allocated for DD *DD\_name* with command "command\_string", return code return\_code.

## **Explanation**

The data set could not be allocated to DD name *DD\_name* using the information in *command\_string*. The associated system error messages precede this error, and the TSO/E return code was *return\_code*.

#### System action

The tsocmd command continues.

#### **System programmer response**

Take appropriate action based on the system error messages and return code return\_code.

Refer to the tsocmd command description in <u>z/OS UNIX System Services Command Reference</u> for more information. Verify that the TSOALLOC, SYSEXEC or SYSPROC environment variable has been properly specified, and try the request again.

#### FSUMF004

Unknown or missing operator in symbolic audit mode "operator"

## **Explanation**

There is a missing or invalid operator in the specified symbolic -audit or -aaudit.

## **User response**

Refer to the description of the find command in z/OS UNIX System Services Command Reference for the correct values and reenter the command.

#### FSUMF005

Octal audit mode may contain only digits [0-7] in option

# **Explanation**

When you specify attributes in octal audit mode, the possible values are expressed by some combination of the digits 0 through 7 (for example, 777). You have specified a number outside that range or you have specified characters along with or instead of digits.

## **User response**

Check the description of the find command in z/OS UNIX System Services Command Reference for the correct values and reenter the command.

#### FSUMF006

getgroupsbyname failed

#### **Explanation**

This message indicates a system error.

#### **User response**

Record any other messages and return codes that appear with this one and consult your system programmer or follow local procedures for reporing a problem to IBM.

#### FSUMF007

Invalid printer format: "forms"

## **Explanation**

You specified too many arguments for -d (*dest*) on the 1p command. "Destination\_name", "class" and "forms" are the only permissible arguments on -d. They must be specified in that order.

#### **User response**

Reissue the command with valid arguments on -d.

FSUMF008

Invalid class: "class"

## **Explanation**

You specified the *class* operand of the 1p command incorrectly. *class* can't be longer than one character. Valid values are A-Z and 0-9, but your installation may not have all values defined.

Reissue the command with an appropriate value for class.

#### FSUMF009

Unable to access printer.

## **Explanation**

Dynamic allocation to SYSOUT could not be made. The MVS system did not recognize one or more of the operands you specified on the -1p command.

## **User response**

Check what you specified for "destination\_name", "class", and "forms". You may need assistance from your local help desk or a system programmer.

#### FSUMF010

Unable to open printer ddn('ddn')

## **Explanation**

The system could not OPEN the SYSOUT data set.

## **User response**

This message probably indicates a system error. Consult your system programmer or follow local procedures for reporting a problem to IBM.

FSUMF011

logger: Priority: Priority must be 1-13

## **Explanation**

You have specified an invalid priority value on the logger command. The priority value you specify on logger is used as the descriptor code by the \_\_console2() service.

### **User response**

Provide the appropriate priority value and reissue the command.

FSUMF012

logger: Dest: Destination must be 1-128

#### **Explanation**

You have specified an invalid destination number on the logger command. This number is used as a route code by the \_\_console2() service.

#### User response

Provide the correct destination number and reissue the command.

FSUMF013

logger: wto failed, rc= rc

#### **Explanation**

The logger command could not write your message to the operator console.

#### **User response**

Record the return code and any associated messages that appear with this one and consult your system programmer.

FSUMF014

There is no function provided for this utility

#### **FSUM** messages

## **Explanation**

The function is not supported on z/OS UNIX.

FSUMF015

Unexpected EOF on "string"

## **Explanation**

End of file was reached unexpectedly.

FSUMF016	Writing archive file "file"
FSUMF017	string(string): Bad magic #hexnum

# **Explanation**

Either the wrong file was passed, the file has been corrupted, or if file is of goff object format, records are not fixed at 80 bytes.

## **User response**

Check your archive file.

FSUMF018

Bad byte count on ESD card: offset

## **Explanation**

The object deck was corrupted.

# System action

The program ends.

## **User response**

Recompile the source to create another object deck.

FSUMF019

Bad length on XSD card: offset, length

#### **Explanation**

The object deck was corrupted.

# **System action**

The program ends.

#### User response

Recompile the source to create another object deck.

FSUMF020

File " filename ": Unexpected end of file or archive member

## **Explanation**

The file or archive member does not end with an End record. The file or archive member was corrupted.

# **System action**

The program ends.

Reprocess the file or archive member. You may need to recompile the specified file.

#### FSUMF021

Write permission required to strip "input\_file"

# **Explanation**

The user or process does not have write permission to the input file.

## **User response**

Make sure that your user ID or process has write permission to the file.

FSUMF022

**Cannot set priority** 

# **Explanation**

The request to set or change the scheduling priority of one or more processes failed.

FSUMF047

**Cannot update cron** 

## **Explanation**

Check to make sure that the command you are using: crontab, at, or batch is owed by uid=0 and has set-user-ID bit on.

FSUMF060

man: glob() failure

## **Explanation**

The glob() function failed to generate a pathname. Possible reasons include: insufficient permission to fully search directory paths, inability to allocate memory, or an internal error that caused the function to end.

## System action

The program ends.

## **User response**

The pathname that was attempted is printed if the -x option was selected. It may be necessary to contact your system administrator if permissions are not set to allow access. If insufficient memory or storage was the cause, try freeing up system resources and reattempting the program.

FSUMF061

**Cannot format** *string* 

## **Explanation**

man cannot format this man page because there is no troff formatter shipped with z/OS UNIX.

#### **User response**

Format this man page on a system that supports nroff or troff. Then return the formatted man page to z/OS UNIX and install it in the appropriate /usr/man/LANG/catN directory. Then man will be able to find it.

FSUMF062

man: mkdir( path ) failure

#### **Explanation**

The mkdir() function failed to create the named directory. Possible reasons for the failure include: the pathname names a symbolic link; the process did not have search permission on some component of the pathname; the

#### **FSUM** messages

pathname is too long (it exceeds PATH\_MAX); there is insufficient storage; a component of the pathname prefix is not a directory; or the parent directory is on a read-only file system.

# **System action**

The program ends.

## **User response**

Check the pathname for any of the above errors. It may be necessary to contact your system administrator for errors involving permissions. In the event of insufficient storage, try freeing up system resources or adding more storage.

FSUMF063

string has been corrupted.

# **Explanation**

Previous goff card read specified that it was to be continued on next card, but when next card was read it was not of goff type.

#### User response

Recompile the file, run utility again.

FSUMF068

WARNING: syslist data invalid for *file system*. offset: *syslist offset* length:

## **Explanation**

The system list data returned from a call to w\_getmntent() is in a state that should not occur. This may not affect your operation.

# **System action**

df continues without error.

#### System programmer response

Follow local procedures for reporting problems to IBM.

#### User response

Note the error indicated as part of this message and contact your system programmer. Obtain internal debug info by issuing df with -D option, and supply that data to system programmer as well.

FSUMF070

name1 external link to name2

## **Explanation**

A system error indicating the cause is displayed with this message.

FSUMF072

internal error creating file "filename" -- BPX1CHR failure.

#### **Explanation**

An unexpected error occurred while restoring the external attributes of *filename*.

# **User response**

This problem cannot be fixed by the user. Follow local procedures for reporting the problem to IBM.

**708** z/OS: z/OS UNIX System Services Messages and Codes

FSUMF073

filename: user not authorized to restore extended attribute "c"

## **Explanation**

The user attempted to set the "a", "p", or "l" extended attribute but does not have the proper authorization.

#### **User response**

To be able to set the "a" attribute, you must have at least READ access to the BPX.FILEATTR.APF facility class profile. To be able to set the "p" attribute, you must have at least READ access to the BPX.FILEATTR.PROGCTL facility class profile. To be able to set the "l" attribute, you must have at least read access to the BPX.FILEATTR.SHARELIB facility class profile. See *z/OS UNIX System Services Planning* for more information.

FSUMF074

Cannot append to an archive which is a PDS member.

## **Explanation**

You attempted to append to an archive which is a PDS member. This is not supported.

## **User response**

To append to an archive which is a PDS member, the archive must first be copied into an HFS file or an MVS sequential dataset.

FSUMF075

cmd: A special header file was created for "filename"

## **Explanation**

The pax or tar utility created a special header file in order to preserve file characteristics of *filename* that could not otherwise be preserved using the specified archive format. This message will be followed by one or more messages indicating the specific characteristics that were preserved.

#### **User response**

This is an informational message and does not indicate an error with the archive created. Refer to the z/OS UNIX System Services Command Reference for more information about the pax/tar special header files.

FSUMF076

target of linktype link ("filename") exceeds n chars.

#### **Explanation**

The target of the specified link exceeds the number of characters supported by the pax/tar USTAR format. To store it in the archive requires the use of a special header file.

#### **User response**

This is an informational message. Due to pathname length limitations, the specified link cannot be stored in the archive using the standard archive format. The use of special header records will be required to store the link. Refer to the *z/OS UNIX System Services Command Reference* for more information about the pax/tar special header files.

FSUMF077

cmd: Format error in special header file: "reason"

## **Explanation**

A pax/tar special header file could not be processed due to an error in its format. The reason is shown.

This in an internal error that should not occur under normal circumstances and is most likely an indication that a portion of the archive is corrupted. Verify that the archive was not corrupted (generally due to incorrect transfer between systems). If problem persists, follow local procedures for reporting a problem to IBM.

FSUMF078

Special header ignored. Version number n not supported.

# **Explanation**

The pax/tar archive being read contains a special header which is at a higher level than your version of pax/tar supports. The header will be ignored and any characteristics described within the header will not be applied to the file the header pertains to.

## **User response**

The special header summary file for this archive contains a description of all attributes defined in the special header files for this archive and can be used to manually restore the characteristics. Refer to the z/OS UNIX System Services Command Reference for more information about pax/tar special headers.

FSUMF079

Warning: unsupported field "name" in special header.

## **Explanation**

The special header file describes a file characteristic that is not supported by your present level of pax/tar and so cannot be restored. This is most likely due to the archive having been created with a newer version of pax/tar.

## **User response**

The special header summary file for this archive contains a description of all attributes defined in the special header files for this archive and can be used to manually restore the characteristics that could not be restored in this file. Refer to the *z/OS UNIX System Services Command Reference* for more information about pax/tar special header files.

FSUMF080

cmd: error writing summary special header to archive.

# **Explanation**

An error occurred while writing the summary special header file to the archive. An error message describing the reason for the error will also be provided.

## **User response**

If possible, correct the underlying cause of the error as described by the reason message. For additional help, contact your system programmer or follow local procedures for reporting a problem to IBM.

FSUMF081

*cmd*: Special header file(s) were created for one or more component files in this archive.

# **Explanation**

The purpose of this message is to inform you that one or more special header files were created during the writing of the archive.

#### **User response**

This is an informational message and does not indicate an error with the archive created. Its purpose is to inform you that one or more files had attributes which could not normally be stored using the default pax/tar archive and so were stored using special header files. Refer to the <u>z/OS UNIX System Services Command Reference</u> for more information about pax/tar special header files.

#### FSUMF082

warning: file "pathname" not extracted from archive, substitution resulted in empty filename

## **Explanation**

The substitution pattern specified by the pax -s option resulted in *pathname*" being replaced by an empty string, consequently, *pathname* was not extracted from the archive.

# **System action**

pax continues without error.

#### **User response**

This is an informational message. If you wish "pathname" to be extracted, specify a different substitution pattern or extract "pathname" in a separate command.

FSUMF083

warning: file "pathname" not added to archive, substitution resulted in empty filename

# **Explanation**

The substitution pattern specified by the pax -s option resulted in *pathname*" being replaced by an empty string, consequently, *pathname* was not written to the archive.

## **System action**

pax continues without error.

# **User response**

This is an informational message. If you wish "pathname" to be written, specify a different substitution pattern or append "pathname" in a separate command.

FSUMF084

warning: file "pathname" not copied, substitution resulted in empty filename

# **Explanation**

The substitution pattern specified by the pax -s option resulted in *pathname*" being replaced by an empty string, consequently, *pathname* was not copied to the target directory.

## **System action**

pax continues without error.

## **User response**

This is an informational message. If you wish "pathname" to be copied, specify a different substitution pattern or copy it manually using the cp utility.

FSUMF115

ps internal error return code processing BPX1GTH.

#### **Explanation**

An unexpected error occurred while processing the results from a call to the callable service BPX1GTH (\_\_getthent: "get thread data").

This problem cannot be fixed by the user. Follow local procedures for reporting the problem to IBM. Please note the "internal error" number. If the problem can be recreated, run the same ps command with the "-z" (debug) option and save the debug file created.

FSUMF125

fldata() failed for MVS data set "name"

## **Explanation**

cp/mv failed when trying to retrieve information about the name MVS data set.

#### **User response**

Check the MVS data set *name* based on the error indicated as part of this message.

FSUMF127

cannot reset File Format for file "filename"

## **Explanation**

Not all file systems support the file format.

## **User response**

Check that the file system you are using for your target supports file formats.

FSUMF128

user not authorized to restore File Format for file "filename"

## **Explanation**

File format could not be restored for the *filename*.

#### **User response**

Check file permissions.

FSUMF129

cannot reset extended attribute "attribute" for file "filename"

#### **Explanation**

Not all file systems support the extended attributes.

#### **User response**

Check that the file system you are using for your target, supports the extended attribute you are trying to set.

FSUMF130

cannot reset extended attributes for file "filename"

#### **Explanation**

Not all file systems support the extended attributes.

#### **User response**

Check that the file system you are using for your target, supports the extended attributes you are trying to set.

FSUMF131

appending "suffix" to file "filename" exceeds PATH\_MAX

## **Explanation**

You are trying to append a suffix which will cause the filename to exceed the PATH MAX length.

712 z/OS: z/OS UNIX System Services Messages and Codes

FSUMF132

suffix "suffix" and filename "filename" are the same

# **Explanation**

You are trying to drop a suffix which is the same as the filename. Dropping *suffix* will leave the filename to be an empty string.

FSUMF133

source "filename" is not a supported type of file for this operation

# **Explanation**

You are trying to do an operation on a file that is not supported.

## User response

Check the documentation for this command to see which type of files are supported.

FSUMF134

source "filename" is a directory, not allowed for MVS data set target

## **Explanation**

You are trying to do an operation where the source is a directory and the target is an MVS data set. This source/target combination is not supported.

FSUMF135

source "filename" is either a sequential data set or a partitioned data set, not allowed for partitioned data set target

## **Explanation**

You are trying to do an operation where the source is either a sequential data set or a partitioned data set and the target is a partitioned data set. This source/target combination is not supported.

FSUMF136

sequential data set source and director target is not supported

# **Explanation**

You are trying to do an operation where the source is a sequential data set and the target is a directory. This source/target combination is not supported.

FSUMF137

partitioned data set source and a file target is not allowed

## **Explanation**

You are trying to do an operation where the source is a partitioned data set and the target is a file. This source/target combination is not supported.

FSUMF138

partitioned data set "name" must exist

#### **Explanation**

You specified a partitioned data set that was not found.

# User response

Check that you specified the correct partitioned data set name and that it exists.

FSUMF139

fetch() failed for IEWBIND

## **Explanation**

fetch() of IEWBIND for copying/moving executables to/from PDS failed.

Note the error indicated as part of this message and contact your system programmer.

FSUMF140

IEWBIND function "function" failed with return code return\_code and reason code reason\_code

# **Explanation**

IEWBIND failed for the given function.

# **User response**

Look in z/OS MVS Program Management: Advanced Facilities to check the return code and reason code.

FSUMF141

filename exceeds the pathname limit for IEWBIND

# **Explanation**

The filename specified exceeds what is allowed for pathname length in IEWBIND.

FSUMF142

format is not a supported File Format

# **Explanation**

The file specified has an unsupported File Format.

FSUMF143

name exceeds the maximum data set length

## **Explanation**

The specified data set name was too long. It must be 44 characters or less.

#### **User response**

Make the data set name shorter and try again.

FSUMF144

remove() failed for file filename

#### **Explanation**

cp/mv was unable to remove filename.

#### **User response**

Check the *filename* based on the error indicated as part of this message.

FSUMF145

error when traversing the PDS(E) name

# **Explanation**

While traversing the PDS(E) for a member list, an error was encountered.

#### User response

Check the partitioned data set and try again.

FSUMF146

cannot find member in PDS(E)

The member cannot be found in the PDS(E) anymore.

#### **User response**

Check the partitioned data set and try again.

#### FSUMF147

either name or name2 not found in name3

# **Explanation**

One of the members cannot be found in the partitioned data set anymore.

#### User response

Check the partitioned data set and try again.

FSUMF148

command: spanned records are not supported

## **Explanation**

You tried to cp/mv to/from an MVS data set which has spanned records.

## **User response**

Move the data to a data set with non-spanned records.

FSUMF149

sequential data sets cannot be copied nor moved as executables

# **Explanation**

You specified to cp/mv an MVS sequential data set as an executable.

#### **User response**

Check to make sure you have the correct MVS data set name.

FSUMF154

filename is not a load module

### **Explanation**

You specified to cp/mv the *filename* as an executable but it's not a load module.

#### **User response**

Check to make sure you have the correct file name.

FSUMF155

filename must be in undefined record format to store a load module

# **Explanation**

You specified to cp/mv an executable to an MVS data set that is not in undefined record format.

#### **User response**

Check to make sure you have the correct target name or chose one that is in undefined record format.

FSUMF156

"filename" is a partitioned data set, not supported for MVS target

You tried to cp/mv from a partitioned data set, to an MVS data set. This source/target combination is not supported.

#### **User response**

Check the documentation for the supported source/target combinations.

FSUMF157

filename is an existing sequential data set, no member allowed

# **Explanation**

You specified a member name for an MVS sequential data set. MVS sequential data sets do not have members.

# User response

Check to make sure you have the correct file name.

FSUMF158

Dynalloc failed with error code=*error\_code*, info code=*info\_code* for *filename* 

# **Explanation**

The dynamic allocation failed for *filename*.

# **User response**

Check the dynalloc() error and info codes.

FSUMF159

command: localtime() failed

#### **Explanation**

A system call to convert the calendar to local time has failed.

#### System programmer response

There may be a problem with the TZ environment variable or the current LC\_TOD locale category (assuming a POSIX environment).

#### **User response**

Contact your system programmer.

FSUMF160

Unable to change back to current working directory "pathname"

#### **Explanation**

Could not set the directory back to the original directory. The original directory may have been deleted, renamed, or had its permissions changed since command was started.

#### User response

Ensure that the directory exists and has the correct permissions and cd back to it.

FSUMF161

No recovery files for "name"

You specified a file name that does not contain any recovery files in /etc/recover/\$LOGNAME.

# **User response**

Check value of TMP\_VI environment variable, and run the exrecover utility. Search your file system for any VI\* files which may have been written during another session using a different value for TMP\_VI.

FSUMF162 fuser: Options -c and -f are mutually exclusive.

# **Explanation**

You have specified both the -c and -f options. You can specify one or the other, but not both.

## **User response**

If you want the specified *file* argument to represent a file system, use -c. Otherwise, use -f for fuser to report only *file*.

FSUMF165

Could not send SIGKILL signal to process process.

## **Explanation**

The SIGKILL signal could not be sent to the process because the process does not exist or the user does not have permission to send the SIGKILL signal to the process.

# **User response**

If the target process is still running, the program sending the SIGKILL must be run from an authorized user.

FSUMF166

BPX1GMN failed for device named by pathname devno=n, rc=return\_code, reason=reason\_code

# **Explanation**

The callable service BPX1GMN returned with an unexpected return value when querying the mountpoint for the file system (with device number *n*) named by *pathname*.

#### **User response**

This error indicates a problem with the device *d* or an internal error. Retry the command. If it continues to fail, note the return code and reason code and follow local procedures for reporting the problem to IBM.

FSUMF167

BPX1GTH() failed. Return code=return\_code, reason code=reason\_code

#### **Explanation**

An unexpected error occurred while processing the results from a call to the callable service BPX1GTH (\_\_getthent: "get thread data").

#### **User response**

This problem cannot be fixed by the user. Follow local procedures for reporting the problem to IBM. Please note the return code and reason code.

FSUMF168

w\_getmntent could not obtain mount point for "filesystem".

The pathname for the mount point is not currently available for this file system.

## System programmer response

More detailed information can be found from the MVS console command display omvs,f.

#### **User response**

This condition may be transitory. Try issuing the command again. Otherwise, contact system programmer.

FSUMF170

getsyntax: Cannot retrieve the variant character definitions from the current locale.

## **Explanation**

Unable to locate variant character information/definitions for the current locale.

## System programmer response

Ensure current locale has LC\_SYNTAX defined correctly.

#### **User response**

Contact system programmer.

FSUMF171

cp/mv of link "filename1" to target "filename2" failed

# **Explanation**

Unable to copy/move the filename1.

#### **User response**

Check the system error message displayed with this message.

FSUMF172

MVS data set name name is too long

#### **Explanation**

The data set name exceeds the allowable length.

#### **User response**

Check the data set name and try again.

FSUMF173

Warning: dirname is a directory and will not be traversed without -R.

# **Explanation**

A directory was encountered by the chtag command. Only files, not directories can have a filetag.

# System action

chtag continues.

If you wanted to recursively traverse the directory, and tag/print all of the files contained within it, you must use the -R option. No further action is needed if you wanted to ignore the contents of the directory.

FSUMF174

command: You must enter a codeset name or a ccsid between 0 and 65535 (USHRT MAX).

## **Explanation**

Either the codeset name you specified does not convert to a ccsid, a ccsid was not entered, or the given ccsid is out of range (0 <= ccsid <= USHRT\_MAX).

## **System action**

The command ends.

#### **User response**

Respecify command with a valid code set name or ccsid.

FSUMF175

command: chattr() or fchattr() could not set filetag for filename.

# **Explanation**

The chattr() or fchattr() service failed.

# **System action**

The filetag of the file specified in the error message will not be changed. The command continues.

# **User response**

Check the system error message displayed with this message.

FSUMF177

filename: To set txtflag on, you must have a valid character codeset.

## **Explanation**

You either explicitly tried to turn on txtflag and set a ccsid equal to 0 or 0xFFFF (binary), or you tried to change one of the fields of the filetag which would result in this combination.

#### **System action**

The filetag of the file specified in the error message will not be changed. The command continues.

## **User response**

Find out what state the filetag is in with the -p or -v option, then issue the chtag command with a valid combination of options.

FSUMF178

Arithmetic error, division by 0 or overflow.

#### **Explanation**

awk encountered a floating-point math error. There was either a division by 0 error, or an overflow of a double floating point variable. The allowable range for double floating point numbers is 5.397605e-79 to 7.237006e+75 (for positive numbers).

Check your awk program and data. There could be a formula error, or a range value might have been exceeded. (For example, calculating 57! will exceed the maximum allowed range.)

FSUMF179

command: internal error executing \_\_toCSName(ccsid,...)

# **Explanation**

During the execution of the *command* utility, an unexpected error occurred calling \_\_toCSName with the value *ccsid*. The system error indicating the cause is displayed with this message. If appropriate, *command* will display the *ccsid* rather than the codeset name.

# **System action**

command continues.

## **User response**

Refer to the <u>z/OS C/C++ Runtime Library Reference</u> for an explanation of the system error and contact your system programmer as required.

FSUMF180

ERROR: unable to query existing signal handler

# **Explanation**

The sigaction call returned a failure while attempting to query the existing signal handler.

# **System action**

The command ends.

#### System programmer response

Follow local guidelines for reporting a problem to IBM.

#### **User response**

Refer to the z/OS C/C++ Runtime Library Reference for possible reasons this call may have failed. If unable to resolve, contact your system programmer.

FSUMF181

WARNING: unable to reset the signal handler for signal back to its previous state. It has been set back to the system default.

## **Explanation**

For unknown reasons, the signation function returned an error while attempting to restore the previous signal handler. In this case, the signal handler has been restored to the system default.

#### **System action**

The command continues.

## User response

If desired, reset the signal handler manually. For more information see the z/OS C/C++  $Runtime\ Library$  Reference.

FSUMF182

Could not turn autoconversion off for file

During the execution of a command, the fcntl() failed. The system error indicating the cause is displayed with this message.

## **System action**

The command will fail for the file specified in error message.

## **User response**

Refer to the z/OS C/C++ Runtime Library Reference for an explanation of the system error and contact your system programmer as required.

#### FSUMF183

fileno() failed and could not turn autoconversion off for file

# **Explanation**

During the execution of the head or tail command, the fileno() failed and therefore could not turn autoconversion off. The system error indicating the cause is displayed with this message.

# **System action**

The head or tail command will fail for the file specified in error message.

## **User response**

Refer to the *z/OS C/C++ Runtime Library Reference* for an explanation of the system error and contact your system programmer as required.

#### FSUMF186

warning: codeset conversion performed on "file" which is tagged "mixed".

## **Explanation**

Codeset conversion was performed on *file* which is tagged as "mixed" (textflag off and a valid codeset value). Because this file might contain non-text data, this message is a warning that some data might have been corrupted as a result of the conversion.

## **System action**

Processing continues.

#### **User response**

If the file contains non-text data, do not perform translation or use "-o fromfiletag".

#### FSUMF187

unable to determine ccsid for codeset "codeset"

#### **Explanation**

A ccsid (numerical id associated with a codeset) could not be determined for the specified *codeset*. This is mostly likely due to an incorrect spelling or the codeset is not supported on your system.

# **System action**

processing does not continue--application ends.

Verify that the codeset is valid.

FSUMF188

warning: codeset conversion performed on "file" which is tagged "binary".

# **Explanation**

Codeset conversion was performed on *file* which is tagged as "binary". Because this file is identified as containing non-text, this message is a warning that some or all of the data in the file might have been corrupted as a result of the conversion.

# **System action**

Processing continues.

## **User response**

If the file contains non-text data, do not perform translation or use "-o fromfiletag".

FSUMF189

warning: *file* is tagged with a different codeset than the "from=" codeset.

# **Explanation**

file is tagged with a different codeset than the codeset identified on the "from=" option. Consequently, converting this file using the "from=" codeset will cause the data in the file to be corrupted.

## System action

The file is converted and processing continues.

#### **User response**

To prevent this file from being incorrectly converted, do not specify it for extraction or removal, or use the "-o fromfiletag" option to cause pax to use the file's codeset rather than the one specified on the "from=" option.

FSUMF190

The "fromfiletag" and "setfiletag" options are not valid without "-o from=,to="

# **Explanation**

The "-o fromfiletag" and "-o setfiletag" are only valid when used with the "-o from=,to=" option.

# **System action**

The application ends abnormally.

#### User response

Either specify the "-o from=,to=" option, or do not use the "-o fromfiletag" or "-o setfiletag" options.

FSUMF191

preserving filetag information

#### **Explanation**

This message indicates that a special header record has been created to preserve filetag information associated with this file.

## System action

Processing continues.

## **User response**

This is an informational message. Filetag information cannot be stored in the archive using the standard archive format. The use of special header records will be required to preserve the filetag information. Refer to the <u>z/OS</u> UNIX System Services Command Reference for more information about the pax/tar special header files.

FSUMF192

fcntl() failed and could not set autoconversion for file

# **Explanation**

During the execution of the lex or yacc command, the fcntl() failed. The system error indicating the cause is displayed with this message.

## **System action**

The lex or yacc command will fail for the file specified in error message.

## **User response**

Refer to the *z/OS C/C++ Runtime Library Reference* for an explanation of the system error and contact your system programmer as required.

FSUMF193

find: "-option option argument" is invalid

#### **Explanation**

The given option and/or the argument are incorrect.

#### **User response**

Check for the correct options in the z/OS UNIX System Services Command Reference and try again.

FSUMF194

unable to determine codeset for ccsid "ccsid" for file file

## **Explanation**

You specified the -F option and the source's filetag's ccsid does not have a corresponding codeset.

#### **User response**

Check for the correct options in the z/OS UNIX System Services Command Reference and try again.

FSUMF195

file is tagged with a different codeset than the "-f codeset".

## **Explanation**

You specified the -F and -f option and the source's filetag ccsid does not match the -f codeset given.

#### User response

Check for the correct options in the z/OS UNIX System Services Command Reference and try again.

FSUMF196

file is untagged and -f codeset was not specified

You specified -F option without -f codeset however, the source file has no filetag set.

### **User response**

Check for the correct options in the z/OS UNIX System Services Command Reference and try again.

#### FSUMF197

catalog should be a binary file but is tagged as text

# **Explanation**

Message catalog is always a binary file.

# **User response**

Check the catalog specified, untag and try again.

FSUMF198

Could not reset autoconversion

# **Explanation**

Utility could not turn back the autoconversion for the thread.

#### **User response**

Try again.

FSUMF208

command: stdin ("-") can only be used once.

# **Explanation**

During the execution of the *command* utility, stdin was specified for use in more than one place, either as input for files containing ACL entry data, or as pathnames on which setfacl will operate.

# **System action**

The command will fail with a usage message.

## **User response**

Respecify the command using proper syntax. See z/OS UNIX System Services Command Reference for more information.

FSUMF209

command: option text Unable to parse text into an ACL: failing entry

# **Explanation**

During the execution of *command*, a call to acl\_from\_text() failed due to a parsing error at the specified entry, or due to invalid specification of delimiters. The setfacl option that was currently being processed is displayed in *option text*.

# **System action**

The command will fail with an error.

Issue the command again using the correct syntax. If you specified a z/OS UNIX user ID or RACF group ID, make sure an OMVS segment exists for the specific ID. For more information on using z/OS UNIX System Services commands, see z/OS UNIX System Services Command Reference.

FSUMF220

command: option text The given input did not contain any ACL entries.

## **Explanation**

The ACL entry data supplied by the user via stdin or command-line is either empty or contained only white-space or comments. The setfacl option that was currently being processed is displayed in *option text*.

# **System action**

The command will exit with an error.

## System programmer response

None.

## **User response**

Verify ACL entry files contain data and verify command-line. If piping getfacl output as input to setfacl, verify ACLs exist on the original file, and that they are getting displayed properly.

FSUMF221

option text ACL text contains more than three base ACL entries: error text

# **Explanation**

A call to acl\_from\_text() failed with E2BIG because too many base entries were specified in the ACL entry text. The setfacl option that was currently being processed is displayed in *option text*. The failing entry or a descriptive message is displayed in *error text*.

#### **System action**

The command will exit with an error.

#### **System programmer response**

None.

## **User response**

Verify the ACL entry data has the proper number of base ACL entries.

FSUMF222

option text acl\_from\_text() failed.

#### **Explanation**

A call to acl\_from\_text() failed. The errno is displayed. The setfacl option that was currently being processed is displayed in *option text*.

# **System action**

The command will exit with an error.

## System programmer response

Follow local procedures for reporting problems to IBM.

# **User response**

Refer to the z/OS C/C++ Runtime Library Reference for an explanation of the system error. If unable to resolve, contact your system programmer.

#### FSUMF223

Internal error. descriptive text: return code or value in error

# **Explanation**

Possibly, a call to a run-time function, specified in *descriptive text* failed with *return code*. In this case, the errno is displayed. *descriptive text* may also contain the name of a function which failed.

# **System action**

The command will exit with an error.

## System programmer response

Follow local procedures for reporting problems to IBM.

# **User response**

Contact system programmer.

#### FSUMF227

command: Extended ACL entry not unique for id

# **Explanation**

A call to acl\_valid() failed because an extended ACL entry is not unique for the user id or group id (specified by *id*) There may exist only one ACL entry for a given user id or group id.

# System action

The command will exit with an error.

#### System programmer response

None.

# **User response**

Verify that all ACL input data does not contain duplicate entries.

#### FSUMF228

command: Base ACL entry not unique for tag type: base entries

# **Explanation**

A call to acl\_valid() failed because a base ACL entry was specified more than once. The base entries are displayed by  $base\ entries$  The "user", "group" and "other" base ACL entries may each be specified only once.

#### **System action**

The command will exit with an error.

## System programmer response

Follow local procedures for reporting problems to IBM.

# **User response**

Verify that all ACL input data does not contain duplicate base ACL entries. If ACL type appears as "unknown", it is an internal error, and contact system programmer.

FSUMF229

command: warning: pathname is not a directory so type of ACL ACL cannot be changed.

#### **Explanation**

An attempt was made to change the File Default or Directory Default ACL entries on a pathname which is not a directory. File Default and Directory Default ACL entires are only associated with directories.

## **System action**

The command will continue to the next file, unless -a (abort) was specified.

## System programmer response

None.

#### **User response**

Verify ACL input data is as intended.

FSUMF230

Unable to delete ACL type ACL from pathname

# **Explanation**

The setfacl command was unable to delete the ACL of type ACL type from pathname. This may have occurred if user attempted to delete an ACL (with -D option), or if a user attempted to set an ACL (with -s or -S). When performing a "set" operation, the entire ACL for the file is replaced, so any existing ACLs are deleted.

# **System action**

The command will continue to the next file, unless -a (abort) was specified.

#### System programmer response

Follow local procedures for reporting a problem to IBM.

#### **User response**

Refer to the z/OS C/C++ Runtime Library Reference for an explanation of the system error. If unable to resolve, contact your system programmer.

FSUMF231

command: Failure setting ACL type ACL for pathname: three base entries are required.

## **Explanation**

The user is attempting to set (replace) an ACL of type ACL type, but the three required base entries were not specified.

## **System action**

The command will exit with an error.

#### System programmer response

None.

## **User response**

Reissue the command with the required base entries.

FSUMF232

acl\_set\_file() failed on ACL type ACL for "pathname": return value:return value

## **Explanation**

A call to acl\_set\_file() failed for *pathname* while trying to modify the ACL of type *ACL type* and returned *return* value.

## **System action**

The command will continue to the next file, unless -a (abort) was specified.

# System programmer response

None.

## **User response**

Verify owner of file. Only owner or superuser of a file may change an ACL for that file. Verify (using getconf) the number of ACL entries specified is not more than is allowed by the system. Verify (using getconf) that the file system containing pathname supports ACLs. Verify that the current security product supports ACLs.

FSUMF233

command: Base ACL entry not unique or has invalid type.

# **Explanation**

A call to acl\_set\_file() failed because a base ACL entry is not unique for the user id or group id, or the entry contains an invalid type. There may exist only one ACL entry for a given user id or group id.

# **System action**

The command will continue to the next file, unless -a (abort) was specified.

#### System programmer response

None.

## **User response**

Verify that all ACL input data does not contain duplicate entries and that the ACL entries contain valid values for the type of ACL entry. See z/OS UNIX System Services Command Reference for more information on syntax of ACL entries.

FSUMF234

command: Extended ACL entry not unique or has invalid type: string

A call to acl\_set\_file() failed because an extended ACL entry is not unique for the user id or group id, or the entry contains an invalid type. There may exist only one ACL entry for a given user id or group id.

## System action

The command will continue to the next file, unless -a (abort) was specified.

## System programmer response

None.

## **User response**

Verify that all ACL input data does not contain duplicate entries and that the ACL entries contain valid values for the type of ACL entry. See z/OS UNIX System Services Command Reference for more information on syntax of ACL entries.

FSUMF235

command: The entries file: "file" is empty.

## **Explanation**

A file, intended to hold ACL entry data as input to setfacl, contains no entries.

## **System action**

The command will exit with an error.

## System programmer response

None.

#### **User response**

Verify file contains ACL entry data.

FSUMF236

acl init() failed.

#### **Explanation**

The C-RTL acl\_init() function failed.

# **System action**

The command terminates.

#### **User response**

Check the EDC message for cause of failure.

FSUMF237

acl\_to\_text() failed when processing file "filename"

#### **Explanation**

The C-RTL acl\_to\_text() function failed.

# **System action**

The command terminates.

Check the EDC message for cause of failure.

#### FSUMF238

The -acl\_entry primary allows only a single acl entry

## **Explanation**

The acl\_entry primary allows only one extended acl entry.

# **System action**

The command terminates.

# **User response**

Check that the acl\_text you specified for -acl\_entry does not contain any commas or newlines. Look in <u>z/OS UNIX</u> System Services Command Reference for correct syntax.

FSUMF239

The specified acl text for -acl entry primary has unknown tag type

## **Explanation**

The acl\_text does not contain a valid tag type.

# **System action**

The command terminates.

## User response

Look in the z/OS UNIX System Services Command Reference for valid syntax.

FSUMF240

The specified acl\_text for -acl\_entry primary has incorrect permission field

#### **Explanation**

The acl\_text specified has invalid permissions.

# **System action**

The command terminates.

#### User response

Look in the z/OS UNIX System Services Command Reference for valid syntax.

FSUMF241

Incorrect syntax of acl\_text for -acl\_entry primary.

#### **Explanation**

The acl\_text specified has invalid syntax.

# **System action**

The command terminates.

Look in the z/OS UNIX System Services Command Reference for valid syntax.

FSUMF242

command: warning: seclabel "seclabel" already exists for "filename"

#### **Explanation**

The current file already has a seclabel assigned. Once a file is assigned a seclabel, chlabel cannot be used to change it.

# **System action**

The command continues to the next file.

## **User response**

Remove the seclabel from the file and reissue chlabel.

FSUMF243

command: chattr() could not set seclabel for "filename"

#### **Explanation**

The chattr() service failed. The system error indicating the cause is displayed with this message.

# **System action**

The file specified in the error message will not be changed. The command continues.

## User response

Refer to the z/OS C/C++ Runtime Library Reference for an explanation of the system error and contact your system programmer as required.

FSUMF244

command: warning: -h or -L not specified. Symbolic link "filename" not changed.

#### **Explanation**

The current file is a symbolic link. To change the seclabel for a symbolic link, or for the file to which it points, either -h or -L must be specified.

#### **System action**

The command continues to the next file.

#### **User response**

Specify either -h or -L to assign a seclabel for filename.

FSUMF246

command: lchattr() could not set seclabel for "filename"

#### **Explanation**

The chattr() service failed. The system error indicating the cause is displayed with this message.

# **System action**

The file specified in the error message will not be changed. The command continues.

Refer to the z/OS C/C++ Runtime Library Reference for an explanation of the system error and contact your system programmer as required.

FSUMF247

command: seclabel cannot be greater than numchars characters.

## **Explanation**

The system's limit for the size of a seclabel is *numchars*.

# System action

Command terminates.

## **User response**

Reissue the command using a valid seclabel.

FSUMF248

command: warning: -c not specified. "filename" not changed.

## **Explanation**

The current file resides on a separate file system than that of the originating file for which chlabel was called.

# **System action**

The command continues to the next file.

# **User response**

Specify -c to allow chlabel to cross device boundaries, or reissue chlabel to specifically assign a seclabel for *filename*.

FSUMF249

Error during directory traversal of pathname

## **Explanation**

An error occurred while traversing the directory *pathname*. The system error indicating the cause is displayed with this message.

# **System action**

The directory traversal for this pathname terminates and the command continues.

#### **User response**

Refer to z/OS C/C++ Runtime Library Reference for an explanation of the system error.

FSUMF250

command name: Error during directory traversal of pathname.

#### **Explanation**

An error occurred while traversing the directory pathname.

# **System action**

The directory traversal for this pathname terminates and the command continues.

## System programmer response

Follow local procedures for reporting problems to IBM.

#### **User response**

If unable to resolve, contact the system programmer.

#### FSUMF271

Invalid user/uid for option -e

# **Explanation**

User specified the option -e with an argument that could not be mapped to a username nor uid.

# **System action**

The utility terminates immediately.

#### **User response**

Correct the argument for option -e and try the command again.

#### FSUMF272

Could not get username for -e uid (uid)

# **Explanation**

User specified the option -e uid and that uid could not be mapped to a username. This option requires that the uid is mapped to a username so that a supplementary group list can be obtained.

# System action

The utility terminates immediately.

#### User response

Check the uid used with -e option and try again.

#### FSUMF273

Could not get supplementary group for user user

# **Explanation**

User specified the option -e user. This option requires that a supplementary group list is obtain and it could not be.

# **System action**

The utility terminates immediately.

#### **User response**

Check the EDC message for cause of failure.

#### FSUMF274

WARNING: file " *filename* " is not a regular file nor a directory... skipping

# **Explanation**

ACLs can only be set on regular files and directories.

#### **FSUM** messages

# **System action**

The utility continues to the next file.

#### **User response**

Check the filenames and try again.

FSUMF275

WARNING: file " filename " is not a directory

# **Explanation**

The user specified a -d or -f option which applies only to directories.

# System action

The utility continues to the next file.

## **User response**

Check the option and/or filenames and try again.

FSUMF277

acl\_to\_text() failed and could not display extended acl entries for file filename

# **Explanation**

The C-RTL function is used to convert the extended acl entries into a string to be displayed. That function failed.

# **System action**

The utility continues.

#### **User response**

Check the EDC message for cause of failure.

FSUMF278

Someone is adding ACL entries as we try to get them for file filename

## **Explanation**

While the utility is trying to get all the ACL entries, the number of extended ACL entries in the file is increasing.

## **System action**

The utility continues.

#### User response

Reissue the command.

FSUMF279

Could not get acl\_type ACL for file "filename"

# **Explanation**

There was an error when the command tried to get the ACL information for the file.

# **System action**

The utility terminates immediately if out of memory otherwise it continues.

734 z/OS: z/OS UNIX System Services Messages and Codes

Check the additional errors being displayed.

#### FSUMF280

Could not restore acl\_type ACL for file "filename"

## **Explanation**

There was an error when the command tried to restore ACL information for the target file.

## **System action**

The utility continues.

## **User response**

Check the additional errors being displayed.

FSUMF300

Unable to allocate output descriptor: bpxwdyn return code=rc

## **Explanation**

The internal routine bpxwdyn failed while attempting to create an output descriptor. *rc* is the return code value returned from bpxwdyn. This error should not occur under normal circumstances and may be the result of an internal problem with bpxwdyn or the utility that invoked it.

# **System action**

The utility terminates immediately.

# User response

Retry the command and if the problem persists, note the return code and follow local procedures for reporting a problem to IBM.

#### FSUMF301

Unable to allocate output descriptor: reason code=rsn, info code=info

## **Explanation**

The utility was unable to allocate an output descriptor. *rsn* is the dynamic output return code (S99ERROR) and *info* is the information code (S99INFO).

#### **System action**

The utility terminates immediately.

# **User response**

A return code of 0x4 and info code of 0x0401 are most likely caused by the utility running in shared address space. Turn off the shared attribute bit using extattr and contact your system programmer to investigate the process used to install the utility. All other codes can be looked up in the dynamic output return codes table found in the *z/OS MVS Programming: Authorized Assembler Services Guide*. If the problem cannot be resolved, note the return and info codes and contact your system programmer or follow local procedures for reporting a problem to IBM.

FSUMF302

readdir() failed: reason code hex value

# **Explanation**

The C-RTL function readdir() failed.

## **System action**

The command terminates.

## **User response**

Check the EDC message and the errno2 reason code given.

#### FSUMF310

#### preserving ACL information

## **Explanation**

This message indicates that a special header record has been created to preserve extended ACL (Access Control List) information associated with this file.

# **System action**

Processing continues.

## **User response**

This is an informational message. Extended ACL information cannot be stored in the archive using the standard archive format. The use of special header records will be required to store the ACL information. Refer to the z/OS UNIX System Services Command Reference for more information about the pax/tar special header files.

#### FSUMF311

cmd: cannot set ACLs.

# **Explanation**

This message is displayed when the *cmd* utility could not set ACLs on one or more files. Additional messages may be displayed with more specific information on the failure. Generally, this error indicates that the user does not have sufficient authority.

# **System action**

Processing ends.

## User response

Review any additional messages for the reason and take appropriate action. Verify that you have sufficient authority.

#### FSUMF312

unknown error: ioctl(action) failed, reason=0xhexnum1, info=0xhexnum2

# **Explanation**

An unexpected error occurred when attempting to perform *action* with ioctl(). The reason code and info code are provided.

# **System action**

The program ends.

#### **User response**

This error indicates an unexpected problem retrieving or setting ACLs which is not expected. Retry the command. If it continues to fail, note the reason code and info code and follow local procedures for reporting the problem to IBM.

#### FSUMF313

#### Could not restore ACLs. Too many entries.

# **Explanation**

The system limit for ACL entries per file is less than the number of ACL entries attempted to be set.

## **System action**

The program ends.

## **User response**

Determine the ACL entries limit for your system and set no more than this limit. For pax and tar, the -oA or -LA options, respectively, can be used to display the ACLs being set. This information can be captured and used to manually restore ACL entries.

#### FSUMF314

#### pathname too long to be saved in tar format-- saved as: newpath

# **Explanation**

The pathname of the source file is greater than 100 characters and so cannot be stored using the original tar archive format. It has been shortened to a new pathname *newname* that is less than or equal to 100 characters.

## **System action**

Program continues.

## **User response**

If the new name will not cause a problem, the user does not need to take any action. If the new pathname may cause a problem, the user may choose to specify the -U option which will cause tar to use the USTAR archive format which allows pathnames up to 255 characters, or the user may choose to simply rename the source file.

#### FSUMF315

#### Cannot define temporary file

## **Explanation**

A temporary file was required to perform the requested operation (such as command substitution). The shell was unable to define a unique filename in a temporary directory. This may be due to a problem with the directory.

## **System action**

The operation ends. The shell continues.

### **User response**

If the TMPDIR variable specifies a directory name, ensure that it is a writable directory for the user. If TMPDIR is not defined, ensure that /tmp exists as a writable directory.

#### FSUMF316

#### Cannot open temporary file filename

#### **Explanation**

A temporary file was required to perform the requested operation (such as command substitution). The shell was unable to create or open the temporary file. A system error indicating the reason is displayed with this message.

## **System action**

The operation ends. The shell continues.

## **User response**

Fix the error indicated by the system error message.

FSUMF317

integer overflow

## **Explanation**

You specified an integer value that exceeds the maximum integer value allowed, as limited by the configuration variable LONG\_MAX.

## **User response**

Specify an integer within the valid range.

FSUMF318

The file owner uid (uid) does not match job owner uid (uid)

## **Explanation**

The job owner who originally issued the crontab or at job, is not the owner of the file containing the job. Either the file was modified or created manually or the username's uid was changed.

## User response

Using the content of the crontab or at job, re-issue the crontab/at command. The crontab/at job files should never be changed nor created manually.

FSUMF319

File tag exists but pax cannot store the tag information using this format/option(s) for file *filename* 

# **Explanation**

The *filename* has the file tag set but the pax format/option used cannot store that information in the archive. In order to store the file tag, one of the following must be used: \_OS390\_USTAR=Y environment variable, -o saveext, or -x os390.

#### **User response**

Use the pax format/options which allow storing file tag information. Refer to <u>z/OS UNIX System Services</u> Command Reference for more information.

FSUMF320

command: symbolic link "symlink": this format/option(s) does not permit symbolic links to pathnames longer than n

#### **Explanation**

The format of the tar and USTAR archives does not allow the storing of symbolic links whose target pathname exceeds *n* characters. In order to store the greater than 100 characters symbolic links, one of the following must be used: \_OS390\_USTAR=Y environment variable, -o saveext, or -x os390.

# System action

The program continues.

For z/OS Release 8 or later, pax and tar support an extended USTAR format, which can store symbolic links whose target exceeds *n* characters. See *z/OS UNIX System Services Command Reference* for more information.

FSUMF323

ACLs exist but pax cannot store the ACL information using this format/option(s) for file *filename* 

## **Explanation**

The *filename* has the ACL set but the pax format/option used cannot store that information in the archive. In order to store the ACL, one of the following must be used: \_OS390\_USTAR=Y environment variable, -o saveext, or -x os390.

#### **User response**

Use the pax format/options which allow storing the ACLs information. Refer to <u>z/OS UNIX System Services</u> Command Reference for more information.

FSUMF324

ACLs exist but tar cannot store the ACL information using this format/option(s) for file *filename* 

#### **Explanation**

The *filename* has the ACL set but the tar format/option used cannot store that information in the archive. In order to store the ACL, one of the following must be used: \_OS390\_USTAR=Y environment variable with -U, -UX, or -S.

# **User response**

Use the tar format/options which allow storing the ACLs information. Refer to <u>z/OS UNIX System Services</u> <u>Command Reference</u> for more information.

FSUMF325

File tag exists but tar cannot store the tag information using this format/option(s) for file *filename* 

### **Explanation**

The *filename* has the file tag set but the tar format/option used cannot store that information in the archive. In order to store the file tag, one of the following must be used: \_OS390\_USTAR=Y environment variable and -U, -UX, or -S.

## **User response**

Use the tar format/options which allow storing file tag information. Refer to <u>z/OS UNIX System Services</u> Command Reference for more information.

FSUMF327

\_writedown failed

#### **Explanation**

A system error indicating the cause is displayed with this message.

## **System action**

The command ends with an error exit status.

FSUMF328

Unexpected \_\_writedown query return value number

A \_\_writedown query operation returned a value that is not recognized by the writedown command.

# System action

The command ends with an error exit status.

## System programmer response

Follow local procedures for reporting problems to IBM.

#### **User response**

Contact the system programmer.

#### FSUMF329

Cannot create temporary file "filename"

## **Explanation**

A system error indicating the cause is displayed with this message.

# **System action**

The command continues for the next file.

# **User response**

Check the cause of error and after correcting the problem, issue the command again.

#### FSUMF332

Arithmetic overflow on limit number

## **Explanation**

You specified a limit value that, when multiplied by the unit size, exceeds the maximum value allowed. The result of this multiplication must fit in an unsigned 64-bit integer.

#### **User response**

Specify a limit value within the valid range.

#### FSUMF333

CMD: command The file owner uid (uid) does not match job owner uid (uid)

## **Explanation**

The job file owner must match the MVS identity of the user who issued the job, unless the job file owner is uid(0). The crontab/at jobs must not be created or changed directly without using crontab/at commands.

## System action

The program continues to next item.

#### **User response**

Check the crontab/at job and re-issue under environment where the MVS identity is the same as the real uid (or uid is 0). See *z/OS UNIX System Services Command Reference* for more information.

FSUMF334

chown() on file " uid " failed

When real uid does not match MVS identity, crontab -e command attempts to chown() the temporary file it creates, so that it can be edited.

## **System action**

The program fails.

## **User response**

Check the system error message displayed with this message. Re-issue the command. See z/OS UNIX System Services Command Reference for more information.

FSUMF335

setuid() failed: uid= uid

## **Explanation**

The program was not able to change the identity to process the entry.

# **System action**

The program fails.

# **User response**

Check the system error message displayed with this message. Re-issue the command. See z/OS UNIX System Services Command Reference for more information.

FSUMF336

Security error: Mismatch between uid ( *uid* ) and MVS identity (user= *user*, uid= *uid* ) is not supported

#### **Explanation**

The real uid must match the MVS identity (except when uid is 0).

# **System action**

The program fails.

#### **User response**

See z/OS UNIX System Services Command Reference for more information.

FSUMF337

getpwnam() failed for user= user

#### **Explanation**

Cannot find MVS identity user in the user database.

### **System action**

The program fails.

#### **User response**

Check the system error message displayed with this message.

FSUMF338

Component file "filename" is too large to archive.

The size of a component file in a pax or tar archive must be less than 8 gigabytes.

# System action

This file will be skipped. The command continues.

## **User response**

Split the file into smaller files before archiving again.

FSUMF339

Premature end of file reached on archive "filename". Extracted file "filename" is incomplete.

## **Explanation**

Pax or tar has read to the end of the archive file and it is not complete. It is possible the archive is corrupted.

## **System action**

The command ends.

## **User response**

Make sure the archive file is complete before reissuing the command.

FSUMF342

pid: Cannot superkill pid -1 (all processes)

# **Explanation**

A "kill -K" command specified a process id (pid) of -1. Pid -1 indicates that the superkill should be sent to all processes for which you are authorized. This is not supported for superkill.

#### **System action**

Processing of pid -1 ends. If there are more arguments, the command continues.

#### **User response**

Issue the "kill -K" command only for positive pid values which have not terminated from a prior "kill -s KILL".

FSUMF343

pid: Cannot superkill a process group

## **Explanation**

A "kill -K" command specified a process id (pid) of 0 or a negative value, indicating that the superkill should be sent to a process group. This is not supported for superkill.

#### **System action**

Processing of *pid* ends. If there are more arguments, the command continues.

## **User response**

Issue the "kill -K" command only for positive pid values which have not terminated from a prior "kill -s KILL".

FSUMF344

pid: Cannot superkill without prior KILL signal to process

A "kill -K" command specified a process id (pid) that had not been sent a KILL signal at least 3 seconds earlier.

# **System action**

Processing of pid ends. If there are more arguments, the command continues.

## **User response**

Issue the "kill -s KILL" command for the pid. Wait 3 seconds. If the process does not terminate, then issue the "kill -K" command for the pid.

FSUMF345

pid: \_\_superkill: reason code = reason\_code

# **Explanation**

A "kill -K" command invoked the \_\_superkill() service, which failed with the reported reason code.

# **System action**

Processing of *pid* ends. If there are more arguments, the command continues.

## **User response**

Take appropriate action based on reason code.

FSUMF346

job: pid: Cannot superkill a process group

## **Explanation**

A "kill -K" command specified a shell job, which indicates that the superkill should be sent to a process group. This is not supported for superkill.

## **System action**

Processing of job ends. If there are more arguments, the command continues.

## **User response**

Issue the "kill -K" command only for pids which have not terminated from a prior "kill -s KILL".

FSUMF347

job : pid : \_\_superkill: reason code = reason\_code

## **Explanation**

A "kill -K" command invoked the \_\_superkill() service, which failed with the reported reason code.

## **System action**

Processing of *job* ends. If there are more arguments, the command continues.

### **User response**

Take appropriate action based on reason code.

FSUMF348

Unexpected wordexp() return value number

A word expansion operation returned a value that is not recognized by the mailx command.

# **System action**

The command continues.

## System programmer response

Follow local procedures for reporting problems to IBM.

# **User response**

Verify the user issuing mailx has a default HOME directory defined. If unable to resolve the problem, contact the system programmer.

FSUMF349

"file\_name": block size of target is 0.

## **Explanation**

MVS target has an invalid blocksize.

# System action

The command ends.

## **User response**

Make sure the block size of MVS target is valid.

FSUMF350

I/O buffer is not big enough. buffer size : size data or attribute : size

### **Explanation**

System is unable to allocate I/O buffer big enough.

# **System action**

The command ends.

## System programmer response

Follow local procedures for reporting a problem to IBM.

#### **User response**

Contact your system programmer.

FSUMF351

"file\_name": record length of target is invalid.

## **Explanation**

MVS target has an invalid record length.

## **System action**

The command ends.

Make sure the record length of MVS target is valid.

FSUMF352

Warning: IEWBIND function "function" had return code return\_code and reason code reason\_code

## **Explanation**

During converting load module format, IEWBIND function had return code greater than 0.

## System action

The command continues.

## User response

Check the return code and reason code in z/OS MVS Program Management: Advanced Facilities.

FSUMF353

chattr() could not set audit flag type audit flags for filename

## **Explanation**

The \_\_chattr() service failed.

# **System action**

The audit flags of the file specified in the error message were not changed. The command continues.

## User response

Check the system error message displayed with this message. To set auditor audit flags the invoking user id must have the AUDITOR attribute set in the system security product.

FSUMF354

timestamp cron: failed to start a scheduled job. See the cron log for

## **Explanation**

The cron daemon could not start a scheduled job.

# **System action**

The cron daemon continues. Failed at or batch jobs are deleted from the queues. If the error indicated in the log is corrected, a failed crontab job will be started when it is next scheduled to run.

## **User response**

Check the cron log for details of the error.

FSUMF355

tmpnam() returned an empty filename

#### **Explanation**

tmpnam() was unable to define a unique file name in a temporary directory. This may be due to a problem with the directory.

## **System action**

The cron daemon continues.

If the TMPDIR variable specified a directory name when the cron daemon was started, ensure that it is a writable directory for the user who started the cron daemon. If TMPDIR was not defined, ensure that /tmp exists as a writable directory.

FSUMF356

Preserving pathname information which is too long to store in a USTAR header.

## **Explanation**

This message indicates that a special header record has been created to preserve pathname information that is too long to be stored in the USTAR header block. This can be due to a number of reasons:

- 1. The pathname is greater than 255 characters long.
- 2. The pathname cannot be split on a / such that the final component after the split fits in the 100 character name field of the tar header block.
- 3. The initial component after the split is too long to fit in the 155 character prefix field of the tar header block.

# **System action**

Processing continues.

# **System action**

This is an informational message. Refer to <u>z/OS UNIX System Services Command Reference</u> for more information about the pax/tar special header files. Archives with special headers files are not portable.

FSUMF362

No value specified after -W keyword "keyword".

# **Explanation**

-W keyword keyword requires keyword=value format.

## **System action**

The command ends.

#### **User response**

Specify a value after the keyword.

FSUMF363

Cannot copy symbolic link symbolic\_link to an MVS data set.

## **Explanation**

An attempt was made to copy or move a symbolic link to an MVS data set with -P when variable \_UNIX03=YES is set. Symbolic links only exist in UNIX file systems.

# **System action**

Processing for the symbolic link ends and the command continues.

#### **User response**

Make sure the target is not an MVS data set when using -P to process symbolic links.

FSUMF365

Syntax error on -W argument : error

A syntax error occurred while parsing the -W argument string.

## **System action**

The command ends.

### **User response**

Fix the syntax error and try again.

#### FSUMF366

Error processing -W argument : error

## **Explanation**

An error indicated by error occurred while parsing the -W argument string.

## **System action**

The command ends.

## System programmer response

Follow local procedures for reporting a problem to IBM.

## **User response**

Take appropriate action based on the displayed error. If unable to resolve the error, contact your system programmer.

#### FSUMF368

chmod() failed while changing the file permissions for filename.

## **Explanation**

An error occurred while attempting to change the file permissions for *filename*. The system error indicating the cause is displayed with this message.

### **System action**

The command continues.

## System programmer response

Follow local procedures for reporting a problem to IBM.

#### **User response**

Refer to <u>z/OS C/C++ Runtime Library Reference</u> for an explanation of the system error. If unable to resolve the error, contact your system programmer.

#### FSUMF369

command: a pax specific -o keyword was specified for a non-pax format

## **Explanation**

A -o option keyword which only applies to a pax format archive was specified for a non-pax format archive.

# System action

The command continues.

## System programmer response

Follow local procedures for reporting a problem to IBM.

## **User response**

Use pax format for this archive or do not use this -o option keyword.

#### FSUMF370

command: Unknown file format "file format" specified for file "filename"

## **Explanation**

The file being archived has an invalid file format attribute associated with it.

# **System action**

The command continues.

## System programmer response

Follow local procedures for reporting a problem to IBM.

## **User response**

Use the "-o delete=ZOS.filefmt" option to bypass file format processing for the archive.

#### FSUMF371

Value value is not valid for keyword keyword. Keyword not set.

## **Explanation**

An invalid numeric value was specified for a -o option keyword. A pax extended record was not created for the specified keyword.

# **System action**

The command continues.

# System programmer response

Follow local procedures for reporting a problem to IBM.

## **User response**

Verify that the value specified is of the correct for the data type for the keyword specified.

## FSUMF372

Error processing pax extended header.

## **Explanation**

There is a formatting error in a pax extended header in the archive being processed.

## **System action**

The command ends.

## System programmer response

Follow local procedures for reporting a problem to IBM.

Verify that the archive file is not corrupted.

#### FSUMF373

Invalid value "value" for keyword "keyword" for file "filename"

## **Explanation**

pax could not set the attribute corresponding to the specified keyword while extracting or listing the file indicated. The user specified an invalid value for an extended header keyword.

## System action

The command continues.

## System programmer response

If the correct syntax is specified and the problem persists, follow local procedures for reporting a problem to IBM.

## **User response**

Verify the syntax for the extended header keyword.

#### FSUMF382

A break or continue statement cannot occur outside of a loop.

## **Explanation**

A break or continue statement can only be inside the do/while/for loop.

# **System action**

The command ends.

#### User response

Verify that the location of the break or continue statement is correct.

#### FSUMF383

No remembered replacement string.

## **Explanation**

Before you can use the % character as the replacement string, the s command must have been previously issued. This error only occurs when variable \_UNIX03=YES is set.

# System action

The command continues.

#### User response

If there was no previous s command, do not use the % character as the replacement string.

#### FSUMF384

Mark name 'variable' is not currently present in the edit buffer.

# **Explanation**

An error occurred while attempting to access a mark that is not present in the edit buffer. This error only occurs when variable \_UNIX03=YES is set.

The command continues.

## **User response**

Make sure variable has been set to mark a line and the line has not been deleted or modified.

#### FSUMF385

The '!' command cannot be followed by blank characters.

## **Explanation**

The '!' command cannot be followed by blank characters. This error only occurs when variable \_UNIX03=YES is set

# **System action**

The command ends.

## **User response**

Reissue the command without any blank characters after the '!' command.

FSUMF386

The filename argument "filename" must be preceded by one or more blank characters.

## **Explanation**

When using the s command with the w flag, the filename argument *filename* must be preceded by one or more blank characters. This error only occurs when variable \_UNIX03=YES is set.

# **System action**

The command ends.

## **User response**

Add one or more blank characters before the filename argument in the s command. For example, change 's/a/b/ wfile' to 's/a/b/w file'.

#### FSUMF388

The label is too long and cannot allocate buffer.

## **Explanation**

The label was too long and there was not enough memory when trying to resize the pattern buffer to contain the label.

# **System action**

The command ends.

### User response

Reduce label's length.

FSUMF389

Input line is too long and cannot allocate buffer.

## **Explanation**

A line in the input file was too long and there was not enough memory when trying to resize the pattern buffer.

750 z/OS: z/OS UNIX System Services Messages and Codes

The command ends.

## **User response**

Make sure that the input file is a text file and every line is not longer than 10240 bytes.

#### FSUMF390

Pattern space overflow during G command and cannot allocate buffer.

## **Explanation**

The content of the hold buffer was too long to be appended to the pattern buffer, and there was not enough memory when trying to resize the pattern buffer.

# **System action**

The command ends.

## **User response**

Place a smaller amount of text in the hold buffer.

#### FSUMF391

Hold space overflow during H command and cannot allocate buffer.

# **Explanation**

The content of the pattern buffer was too long to be appended to the hold buffer, and there was not enough memory when trying to resize the hold buffer.

# **System action**

The command ends.

#### User response

Place a smaller amount of text in the pattern buffer.

#### FSUMF397

name: cannot open: string

## **Explanation**

Could not open the file. This message is followed by a system error describing the specific reason for the error.

# System action

The program continues.

## **User response**

Refer to the system error message and take appropriate action.

#### FSUMF400

file: internal error

## **Explanation**

There was an internal error when reading the magic files.

The command ends.

### **User response**

Follow local procedures for reporting problems to IBM.

#### FSUMF403

Invalid keyword "keyword" in listopt string.

## **Explanation**

pax could not process the listopt string because it contained an invalid keyword in a format specifier.

# System action

The command ends.

### **User response**

The keyword must be one of the field name entries in ustar header block and octet-oriented cpio archive entry or one of the pax extended header keywords.

#### FSUMF404

Path name is too long(> length)

# **Explanation**

The path name specified on the command line exceeds the displayed number bytes.

# **System action**

The command ends.

#### **User response**

Path name exceeds a limitation of ls command and it is not supported.

#### FSUMF405

Warning: Non-object file "filename(member\_name)" was partially processed as an object file. Symbol processing for this file is ended. Bad magic Oxhexadecimal was found.

## **Explanation**

For the ar command, archive file member <code>member\_name</code> had object file format records and external symbols may have been added to the archive symbol table. When ar found an invalid record starting with <code>hexadecimal</code>, it treated the file as a non-object file. The file is a member of the archive, but additional external symbols from the file were not added to the archive symbol table. For the nm command, file <code>filename</code> or archive file member <code>member\_name</code> had object file format records and the external symbols for the file may have been output. When nm found an invalid record starting with <code>hexadecimal</code>, it stopped displaying external symbols from the file. For the make command, archive file member <code>member\_name</code> had object file format records and the external symbols may have been recognized. When make found an invalid record starting with <code>hexadecimal</code>, it stopped searching external symbols of the archive file member.

# System action

The command continues without setting an exit status.

Check the file or archive file member to make sure it is not corrupted. If the file is an object file, it has an invalid format, and needs to be replaced. If the file is not an object file, no action is required.

FSUMF406

shglob: Internal error (ep=0xhexadecimal)

## **Explanation**

An internal error occurred in the shell during pathname expansion.

# System action

The shell continues to run.

## **User response**

Follow your local procedures for reporting problems to IBM.

FSUMF407

closedir failed in pathname expansion.

## **Explanation**

The closedir operation failed during shell pathname expansion. This message is followed by a system error describing the specific reason for the failure.

# **System action**

The shell continues to run.

# **User response**

Refer to the system error message and take appropriate action. If the problem continues, follow your local procedures for reporting problems to IBM.

FSUMF408

Warning: A break or continue statement occurred outside of a loop.

## **Explanation**

A break or continue statement should only be inside the do/while/for loop.

# **System action**

The awk script exits the current pattern or function and the command continues.

### User response

Verify that the location of the break or continue statement is correct.

FSUMF410

Failed to create a link "filename1" to "filename2".

## **Explanation**

In is unable to create a link for *filename1*. This message is followed by a system error message describing the specific reason for the failure.

# **System action**

The command continues.

Refer to the system error message and take appropriate action.

FSUMF412

function (line\_number): system\_call failed: error\_message

## **Explanation**

The system call failed. The system error is displayed with the message. The error occurred in *function* at line *line\_number*.

## System programmer response

Take appropriate action based on the system error.

## **User response**

See <u>z/OS C/C++ Runtime Library Reference</u> for an explanation of the system error. If unable to resolve, contact your system programmer.

FSUMF415

function (line\_number): system\_call failed for file filename: error message

## **Explanation**

The system call failed for file *filename*. The system error is displayed with the message. The error occurred in *function* at line *line\_number*.

## System programmer response

Take appropriate action based on the system error.

#### **User response**

See *z/OS C/C++ Runtime Library Reference* for an explanation of the system error. If unable to resolve, contact your system programmer.

FSUMF416

Failed to open a pseudoterminal.

### **Explanation**

Failed to open a pseudoterminal.

#### System programmer response

Follow local procedures for reporting problems to IBM.

## User response

See any previous error messages issued and take appropriate action. If unable to resolve, contact your system programmer.

FSUMF419

Running in a background process is not supported.

# **Explanation**

The **script** command cannot be run in a background process. The shell & command operator is one example of how to run a command in a background process.

## System programmer response

Follow local procedures for reporting problems to IBM.

### User response

Do not run the **script** command in a background process. If unable to resolve, contact your system programmer.

FSUMF420

File filename is an unsupported file type.

## **Explanation**

The typescript generated by the **script** command must be written to a z/OS UNIX file.

## **System programmer response**

Follow local procedures for reporting problems to IBM.

## **User response**

Run the **script** command with a supported file type, and try the request again. If unable to resolve, contact your system programmer.

FSUMF421

Syntax error on \_TEXT\_CONV environment variable value "string": error

## **Explanation**

A syntax error indicated by error occurred while parsing the \_TEXT\_CONV environment variable value "string".

# System action

The command ends.

#### User response

Correct the syntax and reissue the command.

FSUMF422

Error processing \_TEXT\_CONV environment variable value "string": error

#### **Explanation**

An error indicated by error occurred while processing the \_TEXT\_CONV environment variable value "string".

## **System action**

The command ends.

#### User response

Take appropriate action based on the displayed error. If unable to resolve the error, contact your system programmer.

FSUMF424

name exceeds the maximum member length

# **Explanation**

The specified member name was too long. It must be 8 characters or less.

#### **FSUM** messages

## **User response**

Make the member name shorter and try again.

FSUMF425

at job "at\_job": too long.

## **Explanation**

The specified  $at_{job}$  was too long.

## **User response**

Check whether the at\_job exists and try again.

FSUMF426

logger: the formatted log message is truncated

## **Explanation**

The formatted log message sent to the MVS write to operator (WTO) was longer than 126 characters.

## **User response**

Shorten your log message.

FSUMF431

logger: unknown facility name: facility\_name

## **Explanation**

The facility name is not recognized.

## **User response**

Refer to the description of the **logger** command in *z/OS UNIX System Services Command Reference*.

FSUMF432

logger: unknown level name: facility\_name

## **Explanation**

The level name is not recognized.

#### User response

Refer to the description of the **logger** command in *z/OS UNIX System Services Command Reference*.

FSUMF433

logger: \_\_console(2) failed, reason

#### **Explanation**

The logger command could not write your message to the operator console.

## **User response**

Record the associated messages and the reason code that appear with this one and consult your system programmer.

FSUMF434

Warning: File *filename* is not copied to MVS because only the z/OS UNIX files are copied from z/OS UNIX to MVS when the -X -I option is used.

The -X -I option is used to copy files that have aliases from z/OS UNIX to MVS. The file *filename* was not copied to MVS because it is not a z/OS UNIX file. z/OS UNIX files are always copied. If you use one **cp** command to copy multiple files that include both UNIX files and MVS data sets, only the z/OS UNIX files are copied.

## **System action**

The **cp** command continues without error.

## **User response**

This is an informational message. If you want to copy *filename* to MVS, issue the **cp** command with only the -X option. Do not use the -I option.

FSUMF435

Warning: File filename is not copied.

## **Explanation**

If you use the -X -I option to copy multiple files in a z/OS UNIX directory or MVS data set to an MVS data set or z/OS UNIX directory, the copy may fail for some files. For this situation, the file *filename* was not copied.

## **System action**

The **cp** command continues without error.

### **User response**

This is an informational message. Check the reason code for the failure reason.

#### FSUMF437

ICSF is required but not available.

### **Explanation**

The Integrated Cryptographic Service Facility (ICSF) was requested to implement the cryptographic hashes. However, ICSF is not available or cannot be used.

## System programmer response

Ensure that ICSF is started.

#### User response

Contact your system programmer.

FSUMF438

ICSF/CSNBOWH failed: return code = return\_code, reason code = reason\_code.

## **Explanation**

The Integrated Cryptographic Service Facility (ICSF) CSNBOWH callable service failed. The callable service return and reason codes are displayed with the message.

## System programmer response

See z/OS Cryptographic Services ICSF Application Programmer's Guide for an explanation of the ICSF callable service failure. If unable to resolve, follow local procedures for reporting problems to IBM.

Contact your system programmer to report the problem.

FSUMF439

input file "filename": Line line\_number bad format.

## **Explanation**

The input line was badly formatted.

# **System action**

The program continues.

## User response

Refer to the description of the checksum utilities in *z/OS UNIX System Services Command Reference*. Make sure that your input file contents are properly formatted.

FSUMF440

input file "filename": Line line number truncated - result questionable.

## **Explanation**

The input line was longer than 2048 bytes and the line has been truncated or split into multiple lines.

# **System action**

The program continues.

## **User response**

Shorten the input line.

FSUMF445

"filename": Is a directory

### **Explanation**

The checksum utility cannot handle directories.

# **System action**

Processing for the pathname is skipped; the command continues.

#### **User response**

Specify files as input, not directories.

FSUMF446

fldata() failed for MVS data set "name"

## **Explanation**

The checksum utility failed when it tried to retrieve information about the name MVS data set.

## System action

Processing for the pathname is skipped; the command continues.

#### User response

Check the MVS data set *name* based on the error indicated as part of this message.

758 z/OS: z/OS UNIX System Services Messages and Codes

#### FSUMF447

#### command: spanned records are not supported

## **Explanation**

The checksum utility cannot handle an MVS data set that has spanned records.

# **System action**

Processing for the pathname is skipped; the command continues.

## **User response**

Specify a data set that does not have spanned records.

#### FSUMF448

"filename": Not a PDS/PDSE member or sequential data set

## **Explanation**

The checksum utility can only handle PDS/PDSE member or sequential data set.

# **System action**

Processing for the pathname is skipped; the command continues.

### **User response**

Specify PDS/PDSE member or sequential data set as input.

#### FSUMF500

failed to set default namespace path for target pid pid.

# **Explanation**

The command attempted to find a namespace according to the given target PID but failed.

# **System action**

The command ends.

# **User response**

Check if the given PID is correct and if the corresponding namespace path exists.

## FSUMF501

neither file path nor target pid is specified for namespace.

## **Explanation**

The command attempted to find a namespace according to the given path name or specified target PID, but failed.

# **System action**

The command ends.

### User response

Check if the given pathname is correct, or the target PID is correct and its corresponding namespace path exists.

### FSUMF505

failed to change directory by root file descriptor.

Could not change the directory according to the current root file descriptor.

# **System action**

The command ends.

## **User response**

Check that you have correct permission to change the directory.

#### FSUMF506

#### failed to change root

# **Explanation**

chroot() failed to change root.

# **System action**

The command ends.

## **User response**

Check that you have correct permission to call chroot().

#### FSUMF508

failed to change directory by current working directory file descriptor

## **Explanation**

Could not change directory according to the current working directory file descriptor.

# **System action**

The command ends.

# **User response**

Check the displayed system error for more information.

#### FSUMF511

### failed to parse specified target pid

## **Explanation**

The command attempted to parse the specified target PID argument, but failed.

## **System action**

The command ends.

### **User response**

Check the format of the given target PID and make sure that it is a valid value.

### FSUMF514

## no target pid is set for --all

# **Explanation**

The command attempts to enter all namespaces of the target process, but the target PID is not set.

The command ends.

## **User response**

Set the target pid with the -t option when using the --all option to enter all namespaces.

#### FSUMF515

setns() failed to reassociate to namespace namespace\_name

## **Explanation**

setns() failed to move the calling process to be specified namespace.

# **System action**

The command ends.

## **User response**

Check the displayed system error for more information.

#### FSUMF524

mount "path" on "target" failed.

## **Explanation**

Cannot create the bind mount on the target path. The mount() system call failed.

## **User response**

Reissue the command with a valid argument.

#### FSUMF526

unshare() failed

## **Explanation**

unshare() failed to unshare the specified namespace.

# **System action**

The command ends.

## **User response**

Check the displayed system error for more information.

#### FSUMF527

waitpid() failed

# **Explanation**

The waitpid() system call failed.

## **System action**

The program ends.

## **System programmer response**

Follow local procedures for reporting problems to IBM.

Contact your system programmer to report the problem.

#### FSUMF528

#### child exited with status status

## **Explanation**

The child process exited with a nonzero status code.

# **System action**

The program ends.

# System programmer response

Contact your system programmer to report the problem.

## **User response**

Follow local procedures for reporting problems to IBM.

#### FSUMF529

## child terminated by signal signal

## **Explanation**

The child process was terminated by a signal.

# **System action**

The program ends.

## System programmer response

Contact your system programmer to report the problem.

# **User response**

Follow local procedures for reporting problems to IBM.

#### FSUMF530

#### child exit failed

## **Explanation**

The child process ended abnormally.

## **System action**

The program ends.

## System programmer response

Contact your system programmer to report the problem.

#### User response

Follow local procedures for reporting problems to IBM.

#### FSUMF531

set the parent-death signal failed

The prctl() system call with argument PR\_SET\_PDEATHSIG failed.

# **System action**

The program ends.

## **System programmer response**

Contact your system programmer to report the problem.

## **User response**

Follow local procedures for reporting problems to IBM.

#### FSUMF533

#### cannot change root directory to dir

## **Explanation**

The chroot() system call failed. The system error indicating the cause is displayed with this message .

# **System action**

The program ends.

## System programmer response

Contact your system programmer to report the problem.

# **User response**

Follow local procedures for reporting problems to IBM.

#### FSUMF534

#### cannot change working directory to dir

# **Explanation**

The chdir() system call failed. The system error indicating the cause is displayed with this message.

# **System action**

The program ends.

## **System programmer response**

Contact your system programmer to report the problem.

### User response

Follow local procedures for reporting problems to IBM.

#### FSUMF536

#### mount the proc filesystem at dir failed

## **Explanation**

The mount() system call failed. The system error indicating the cause is displayed with the message.

The program ends.

## System programmer response

Contact your system programmer to report the problem.

## **User response**

Follow local procedures for reporting problems to IBM.

#### FSUMF538

#### invalid pid specified

# **Explanation**

The specified PID is invalid.

# **System action**

The command ends.

## **User response**

Check the format of the PID to make sure that it is a valid value.

#### FSUMF539

unknown namespace type: namespace\_type

## **Explanation**

The specified namespace is invalid.

## **System action**

The command ends.

# **User response**

Check the format of the given namespace type to make sure that it is a valid value: mnt, net, ipc, pid, uts.

### FSUMF540

#### -p is mutually exclusive with <namespace>

## **Explanation**

You specified both -p and <namespace>. These options are mutually exclusive; you can specify one or the other but not both.

## **System action**

The command ends.

## **User response**

Select the -p option or <namespace> and rerun the command.

## FSUMF541

### invalid namespace argument

# **Explanation**

The specified namespace argument is invalid.

The command ends.

### **User response**

Check the format of the given namespace to make sure that it is a valid value.

#### FSUMF542

#### not found namespace: namespace

## **Explanation**

The command attempted to find the specified namespace, but it was not found.

# **System action**

The command ends.

## **User response**

Check the given namespace to make sure that it is a valid and existing one.

## **FSUZ**

#### FSUZ0001

### % with no previous word matched

## **Explanation**

Because the previous word was not matched, the argument specification was not obtained when history substitution was performed to expand history characters.

# System action

Command terminates.

#### User response

Check the syntax of the history command that you issued.

#### FSUZ0002

#### string not available for regex

## **Explanation**

The standard regex function was not available during condition expression evaluation.

### **System action**

Command terminates.

#### User response

Use a valid standard regex function.

#### **FSUZ0003**

#### The command not found

## **Explanation**

The command didn't execute successfully because command cannot be found.

Command terminates.

### **User response**

Reissue command with a valid command.

#### FSUZ0004

string: assignment to invalid subscript range

## **Explanation**

Attempted to access a value outside the scope of the array.

# **System action**

Command terminates.

## **User response**

Use a valid subscript. The subscript value must be an integer no greater than this value, but no less than one.

#### **FSUZ0005**

string: attempt to assign array value to non-array

## **Explanation**

You cannot assign an array value to a non-array.

## **System action**

Command terminates.

## **User response**

Assign the array value to a valid array.

# FSUZ0006

string: attempt to assign a value to a private parameter in nested scope

## **Explanation**

You cannot assign a value to a private parameter in nested scope.

## **System action**

Command terminates.

### **User response**

Assign the value to a parameter assignment command.

#### **FSUZ0007**

string: attempt to set associative array to scalar

# **Explanation**

You cannot assign an associative array to a scalar value.

# **System action**

Command terminates.

Use a valid parameter or variable assignment command.

#### FSUZ0008

string: attempt to set slice of associative array

## **Explanation**

You cannot assign a value to the slice of associative array.

## **System action**

Command terminates.

## **User response**

Use a valid parameter or variable assignment command.

FSUZ0009

string: bad interpreter: string: number

# **Explanation**

Failed to exec the command or shell script file for the bad interpreter.

# **System action**

Command terminates.

## **User response**

Ensure that the command input or the shell script file is accurate.

#### FSUZ0010

string: can only have a single instance

## **Explanation**

A new instance for a special parameter *string* could not be created because parameter strings can only have a single instance.

# **System action**

Command terminates.

## **User response**

Contact your system programmer.

#### **FSUZ0011**

string: can't assign array value to non-array special

## **Explanation**

You cannot assign an array value to a special builtin parameter when setting a parameter.

## **System action**

Command terminates.

## **User response**

Use a valid parameter setting.

#### FSUZ0012

string: can't assign array value to non-array

# **Explanation**

You cannot assign an array value to a non-array when setting a parameter.

# **System action**

Command terminates.

## **User response**

Use a valid parameter setting.

**FSUZ0013** 

string: can't change type of a special parameter

## **Explanation**

You cannot change this special builtin parameter.

## **System action**

Command terminates.

## **User response**

Use a valid parameter setting.

FSUZ0014

string: can't change type of autoloaded parameter

# **Explanation**

You cannot change the type of parameter that was autoloaded from a module.

# **System action**

Command terminates.

# **User response**

Use a valid parameter setting.

**FSUZ0015** 

string: function definition file not found

## **Explanation**

The command was identified as an undefined function.

# **System action**

Command terminates.

## **User response**

Define the function, or set the PATH variable to include a directory that contains a file with the command name. The contents of this file must include a function definition for the command name.

**FSUZ0016** 

string: inconsistent type for parameter assignment

An inconsistent type was assigned to the parameter.

## **System action**

Command terminates.

## **User response**

Provide a consistent type for parameter assignment.

FSUZ0017

string: invalid element for unset

## **Explanation**

The variable for the unset statement is invalid.

## **System action**

Command terminates.

## **User response**

Reissue the unset statement with a valid variable.

FSUZ0018

string: invalid parameter name

## **Explanation**

The unset command had an invalid parameter name.

## **System action**

Command terminates.

## **User response**

Reissue the unset statement with a valid parameter name.

FSUZ0019

string: parameter not set

## **Explanation**

The parameter was not set because the value of a variable or a parameter was not obtained.

## **System action**

Command terminates.

## **User response**

Ensure that the variable or parameter is set before trying to get the value.

FSUZ0020

string: restricted

### **Explanation**

You were using the restricted version of the shell. The restricted mode does not allow the use of the specified command.

Command terminates.

## **User response**

To use the specified command, you must be using a non-restricted shell.

FSUZ0021

's' or '&' modifier expected after 'g'

## **Explanation**

A 's' or ';&&' modifier was expected after 'g' when a history command is queried.

# **System action**

Command terminates.

## **User response**

Provide a 's' or ';&&' modifier after 'g'.

FSUZ0022

's' or '&' modifier expected after 'g'

## **Explanation**

A character '}' was expected when a history command was queried.

# **System action**

Command terminates.

## **User response**

Provide a character '}'.

FSUZ0023

--emulate: argument required

## **Explanation**

Arguments were expected when issuing option "--emulate".

## **System action**

Command terminates.

#### **User response**

Provide a parameter after the option --emulate.

FSUZ0024

--emulate: must precede other options

# **Explanation**

Option "--emulate" must be located before other options.

## **System action**

Command terminates.

Put option "--emulate" before other options.

#### FSUZ0025

### ambiguous history reference

## **Explanation**

The history reference was ambiguous.

# **System action**

Command terminates.

## **User response**

Provide a clear history reference.

#### FSUZ0026

failed to get current directory: path invalid

## **Explanation**

The path of current directory was invalid.

## **System action**

Command terminates.

## **User response**

Ensure that the path of the current directory is valid.

### FSUZ0027

failed to send entersubsh\_ret report: number

## **Explanation**

The report about entering the sub shell process could not be sent because the report was not created.

# **System action**

Command terminates.

## **User response**

Contact your system programmer.

#### **FSUZ0028**

garbled input at character (binary file as commands?)

## **Explanation**

The command had unrecognized character input. Possibly the binary file was used as a command.

## **System action**

Command terminates.

## **User response**

Provide recognized character input.

#### **FSUZ0029**

argument is not positive: number

## **Explanation**

An attempt was made to use a negative number as the parameter of a command.

# **System action**

Command terminates.

## **User response**

Provide a positive number as the command parameter.

FSUZ0030

argument is not positive: number

# **Explanation**

array too large

# **System action**

Not enough free system resources was available to allocate to array.

## **User response**

Simplify your input or request less space for the array.

**FSUZ0031** 

attempt to add to slice of a numeric variable

# **Explanation**

An attempt was made to assign a double value to indexed integer variable.

# **System action**

Command terminates.

# **User response**

Use a valid parameter or variable assignment command.

FSUZ0032

autoloading module string failed to define builtin: string

## **Explanation**

The autoloading module could not enable the builtin function.

## **System action**

Command terminates.

### **User response**

Ensure that the command corresponding to the autoloaded module is valid.

**FSUZ0033** 

The autoloading module string failed to define math function: string

The autoloading module could not find the math function.

# **System action**

Command terminates.

## **User response**

Ensure that the math function corresponding to autoloaded module is valid.

#### FSUZ0034

The autoloading module string failed to define parameter: string

# **Explanation**

The parameter corresponding to the autoloaded module might not be valid.

# **System action**

Command terminates.

## **User response**

Ensure that the parameter corresponding to the autoloaded module is valid.

#### FSUZ0035

bad [key]=value syntax for associative array

## **Explanation**

[key]=value was required to be the format of associative array during parameter assignment.

## **System action**

Command terminates.

## **User response**

Contact your system programmer.

### FSUZ0036

bad assignment

## **Explanation**

The parameter name was empty, which caused a bad assignment.

## **System action**

Command terminates.

### **User response**

Provide a valid parameter assignment.

### FSUZ0037

bad autoload

# **Explanation**

An autoloaded shell function or shell builtin function could not be obtained.

Command terminates.

### **User response**

Provide a valid autoloaded shell function or shell builtin function.

#### FSUZ0038

bad base syntax

## **Explanation**

An error occurred when evaluating the math expression.

# System action

Command terminates.

## **User response**

Check the syntax of the math expression.

#### FSUZ0039

bad call to modentry

## **Explanation**

An attempt was made to call a modentry call command but it was invalid.

## System action

Command terminates.

## **User response**

Use a valid modentry call command.

#### FSUZ0040

bad floating point constant

# **Explanation**

A floating-point math error occurred. Either a division by 0 error occurred or there was an overflow of a floating point constant.

## **System action**

Command terminates.

## User response

Check the floating point that you used. There could be a formula error or a range value might have been exceeded.

#### **FSUZ0041**

bad math expression: string expected at '%l%s'

# **Explanation**

An error occurred in the arithmetic expression expr.

Command terminates.

## **User response**

Provide a string in the math expression.

FSUZ0042

bad math expression: string expected at end of string

## **Explanation**

A string was expected at the end of the string in the unary operator.

# **System action**

Command terminates.

## **User response**

Provide a string at end of the string in the math expression.

FSUZ0043

bad math expression: ';)' expected

## **Explanation**

A ';)' was expected in the math expression.

# **System action**

Command terminates.

## **User response**

Ensure that the parentheses in the math expression are matched.

FSUZ0044

bad math expression: ';:' expected

# **Explanation**

A ':' was expected in the math expression.

## **System action**

Command terminates.

#### **User response**

Provide a ';:' in the math expression.

FSUZ0045

bad math expression: ':' without '?'

# **Explanation**

A ':' was expected with '?' in the math expression.

# **System action**

Command terminates.

Provide a '?' in the math expression.

#### **FSUZ0046**

bad math expression: character missing after '##'

## **Explanation**

A character was expected after '##' in the math expression.

## **System action**

Command terminates.

# **User response**

Provide a character after '##' in the math expression.

FSUZ0047

bad math expression: empty string

## **Explanation**

An empty expression remained after the math expression was evaluated.

## **System action**

Command terminates.

## **User response**

Ensure that the provided math expression is valid.

FSUZ0048

bad math expression: illegal character: character

## **Explanation**

The math expression contained an illegal character.

# **System action**

Command terminates.

## **User response**

Ensure that the characters of the provided math expression are valid.

**FSUZ0049** 

bad math expression: imaginary power

## **Explanation**

A non-integer was used as the exponent in the math expression.

## **System action**

Command terminates.

## **User response**

Use an integer as the exponent in the math expression.

FSUZ0050

bad math expression: lvalue required

## **Explanation**

The string was expected as the variable to be passed to the parameter code in the math expression.

## **System action**

Command terminates.

## **User response**

Provide a string as the variable in the math expression.

FSUZ0051

bad math expression: out of integers

## **Explanation**

A valid operator was expected in the math expression.

## **System action**

Command terminates.

## **User response**

Specify a valid operator for the math expression.

FSUZ0052

bad math expression: stack empty

# **Explanation**

Internal error --- the operator stack of math expression is empty.

# **System action**

Command terminates.

## **User response**

Follow local procedures for reporting problems to IBM.

**FSUZ0053** 

bad math expression: unexpected ')'

## **Explanation**

There was an unexpected ')' in the math expression.

## **System action**

Command terminates.

### **User response**

Ensure that the parentheses in the math expression are matched.

FSUZ0054 bad option: -character

#### **FSUZ** messages

## **Explanation**

An invalid option was used.

## **System action**

Command terminates.

## **User response**

Provide a valid option.

FSUZ0055

bad output format specification

## **Explanation**

Valid input is expected after the character '[' in the math expression.

# **System action**

Command terminates.

## **User response**

Provide valid input after the character '[' in the math expression.

FSUZ0056

bad pattern: string

## **Explanation**

string does not match the compiled pattern.

## **System action**

Command terminates.

## **User response**

Ensure that the directory name matches the compiled pattern.

FSUZ0057

bad set of key/value pairs for associative array

## **Explanation**

When the hash value was set for the associative array, an invalid set of key/value pairs for the associative array was used.

## **System action**

Command terminates.

## **User response**

Contact your system programmer.

FSUZ0058

bad subscript for direct array assignment: string

An attempt was made to directly assign an invalid subscript to an array. Possibly a char or null was assigned as the array subscript.

# **System action**

Command terminates.

#### **User response**

Assign a valid subscript to the array.

**FSUZ0059** 

bad substitution

# **Explanation**

There was an error in parameter substitution.

# **System action**

Command terminates.

#### **User response**

Provide a valid parameter or contact your system programmer.

FSUZ0060

bad tcgets: number

# **Explanation**

The tty information could not be obtained.

### **System action**

Command terminates.

# **User response**

Look up the displayed errno for more information.

**FSUZ0061** 

can't change option: string

### **Explanation**

The option was not valid.

#### **System action**

Command terminates.

#### **User response**

Provide a valid option.

FSUZ0062

can't change option: -character

### **Explanation**

The option was not valid.

#### **System action**

Command terminates.

#### **User response**

Provide a valid option.

**FSUZ0063** 

can't change variable attribute: string

### **Explanation**

The attribute of a variable or parameter could not be changed because the attribute was not valid.

# System action

Command terminates.

### **User response**

Use a valid variable or parameter set command.

FSUZ0064

can't find terminal definition for string

# **Explanation**

The terminal definition for termcap could not be found in shell interactive mode.

### System action

Command terminates.

#### **User response**

Provide the correct termcap.

**FSUZ0065** 

can't open string

### **Explanation**

string could not be opened, perhaps due to incorrect permissions on the file directory.

#### **System action**

Command terminates.

#### **User response**

Have your system programmer check the permissions on the file or its directory.

FSUZ0066

can't open string: number

# **Explanation**

The file string could not be opened, perhaps due to incorrect permissions on the file directory.

#### **System action**

Have your system programmer check the permissions on the file or its directory.

**FSUZ0067** 

can't open /dev/null: number

# **Explanation**

Failed to open /dev/null.

# **System action**

Command terminates.

# **User response**

Contact your system programmer.

FSUZ0068

can't open input file: string

# **Explanation**

The shell script file could not be opened.

# **System action**

Command terminates.

#### User response

Ensure that the shell script file is valid.

FSUZ0069

can't read history file string

### **Explanation**

The history file could not be opened.

# **System action**

Command terminates.

### **User response**

Ensure that the history file is valid.

**FSUZ0070** 

can't rename string.new to \$HISTFILE

# **Explanation**

The temporary history file could not be renamed to \$HISTFILE.

# **System action**

Command terminates.

#### **User response**

Contact your system programmer.

#### **FSUZ0071**

can't tie a variable to itself: string

#### **Explanation**

Attempted to tie a variable to itself in command tied parameters "typeset -T".

# **System action**

Command terminates.

#### **User response**

Provide a valid tied parameters command.

FSUZ0072

can't tie array elements: string

### **Explanation**

Attempted to tie array elements to a parameter or tie a parameter to array elements.

### **System action**

Command terminates.

#### **User response**

Provide a valid tied parameters command.

**FSUZ0073** 

can't trap SIG%s in interactive shells

#### **Explanation**

An error occurred while the trap was being set.

### **System action**

Command terminates.

#### **User response**

Do not set a trap in interactive shells. Contact your system programmer if you set a trap in interactive shells.

FSUZ0074

cannot do charset conversion (NLS not supported)

#### **Explanation**

The charset conversion failed because NLS is not supported.

# **System action**

Command terminates.

#### **User response**

Determine why NLS is not supported.

FSUZ0075

cannot do charset conversion (iconv failed)

The charset conversion could not be done because the iconv() function failed.

# **System action**

Command terminates.

#### **User response**

Determine why the iconv() function failed.

#### FSUZ0076

cannot do charset conversion (iconv not available)

# **Explanation**

The iconv() function was not available.

# **System action**

Command terminates.

#### **User response**

Determine why the iconv() function was unavailable.

#### FSUZ0077

cannot duplicate fd *number*: *number* 

### **Explanation**

Internal error --- file descriptor duplication failed.

### **System action**

Command terminates.

#### **User response**

Check the FD\_SETSIZE and increase it accordingly. For more information, see z/OS C/C++ Runtime Library Reference.

#### **FSUZ0079**

cannot moved fd number: number

### **Explanation**

Internal error --- file descriptor moved failed.

#### **System action**

Command terminates.

#### **User response**

Check the FD\_SETSIZE and increase it accordingly. For more information, see z/OS C/C++ Runtime Library Reference.

#### FSUZ0081

character not in range

An error occurred when decoding a key string and turning it into the literal characters.

### **System action**

Command terminates.

#### **User response**

The wide character to convert is not a valid character. There is no character correspondence when calling wctomb(). Provide a valid character.

#### FSUZ0082

circular dependencies for module;%s

# **Explanation**

The module you are trying to load has circular dependencies.

# **System action**

Command terminates.

#### **User response**

Eliminate the circular dependencies.

**FSUZ0083** 

closing brace expected

# **Explanation**

An expression contained an unbalanced pair of braces.

#### **System action**

Command terminates.

# **User response**

Provide the missing braces.

#### FSUZ0084

closing bracket missing

#### **Explanation**

An expression contained an unbalanced pair of parentheses.

#### **System action**

Command terminates.

#### **User response**

Provide the missing parenthesis.

**FSUZ0085** 

command not found: string

### **Explanation**

The command cannot execute successfully because command cannot be found.

784 z/OS: z/OS UNIX System Services Messages and Codes

# **System action**

Command terminates.

#### **User response**

Reissue command with a valid command.

FSUZ0086

command too long: string

### **Explanation**

You entered a command line that exceeded the input buffer size.

# **System action**

Command terminates.

### **User response**

Break the command line into smaller workable components.

FSUZ0087

condition can only be used in completion function

### **Explanation**

The condition can only be used in old-style completion functions.

### **System action**

Command terminates.

#### **User response**

Provide a valid condition.

FSUZ0088

corrupt history file string

# **Explanation**

The history file was corrupted or is unreadable.

#### **System action**

Command terminates.

#### **User response**

Ensure that the history file is not corrupted and is readable.

FSUZ0089

could not duplicate socket fd to number: number

### **Explanation**

Internal error --- could not duplicate socket file descriptor.

# **System action**

Check the FD\_SETSIZE and increase it accordingly. For more information, see z/OS C/C++ Runtime Library Reference.

#### FSUZ0090

current directory lost during glob

# **Explanation**

An error occurred when performing filename globbing.

# System action

Command terminates.

#### **User response**

Make sure that the current directory remains unchanged while performing filename globbing.

FSUZ0092

division by zero

### **Explanation**

An arithmetic operation resulted in an attempt to divide by zero.

# **System action**

Command terminates.

#### User response

Modify your program so that division by zero does not occur.

**FSUZ0093** 

The system does not support FIFOs.

#### **Explanation**

A system error indicating the cause is displayed with this message.

# **System action**

Command terminates.

#### **User response**

Contact your system programmer.

FSUZ0094

doubled sort specifier

#### **Explanation**

Doubled sort specifier when performing filename globbing.

#### System action

Command terminates.

#### User response

Ensure that the sort specifier is valid.

786 z/OS: z/OS UNIX System Services Messages and Codes

**FSUZ0095** 

empty MAILPATH component: string

# **Explanation**

The MAILPATH component is empty.

# **System action**

Command terminates.

#### **User response**

Make sure that the MAILPATH variable has a valid value.

**FSUZ0096** 

error in flags

# **Explanation**

An error occurred due to an unrecognized flag in parameters.

# **System action**

Command terminates.

#### **User response**

Contact your system programmer.

**FSUZ0097** 

error on TTY read: error

# **Explanation**

An error occurred during attempt to read from TTY.

# **System action**

Command terminates.

### **User response**

Provide a valid TTY or obtain read access to TTY.

**FSUZ0098** 

event not found: string

#### **Explanation**

The history command cannot be found.

### **System action**

Command terminates.

### **User response**

Use a valid history command.

**FSUZ0099** 

exec flag -a requires a parameter

#### **FSUZ** messages

#### **Explanation**

A parameter is required in command exec flag -a.

# **System action**

Command terminates.

#### **User response**

Provide a parameter for command exec flag -a.

FSUZ0100

exec requires a command to execute

# **Explanation**

A command was not specified after exec to be executed.

# **System action**

Command terminates.

# **User response**

Provide the missing command.

**FSUZ0101** 

exit returned in child!!

### **Explanation**

The shell process exited in the child process in an unexpected manner.

#### **System action**

Command terminates.

# **User response**

Contact your system programmer.

FSUZ0102

failed to allocate job table, aborting.

#### **Explanation**

There was not enough free system resources to perform the operation.

#### **System action**

Command terminates.

#### **User response**

Free up more resources.

**FSUZ0103** 

failed to change effective group ID: number

#### **Explanation**

A system error indicating the cause is displayed with this message.

#### **System action**

Command terminates.

#### **User response**

Ensure that the effective group ID is valid.

#### **FSUZ0104**

failed to change effective user ID: number

### **Explanation**

A system error indicating the cause is displayed with this message.

# System action

Command terminates.

#### **User response**

Ensure that the effective user ID is valid.

#### **FSUZ0105**

failed to change group ID: number

### **Explanation**

A system error indicating the cause is displayed with this message.

### **System action**

Command terminates.

#### **User response**

Ensure that the group ID is valid.

#### **FSUZ0106**

failed to change user ID: number

# **Explanation**

A system error indicating the cause is displayed with this message.

#### **System action**

Command terminates.

#### **User response**

Ensure that the user ID is valid.

### **FSUZ0107**

failed to create named pipe: number

### **Explanation**

Failed to get a temporary named pipe because the attempt to get a unique filename for use as a temporary file failed.

# **System action**

Contact your system programmer.

#### **FSUZ0108**

failed to create named pipe: string, number

#### **Explanation**

Failed to get a temporary named pipe because the system call mknod() failed.

### **System action**

Command terminates.

# **User response**

Check the errno of mknod or contact your system programmer.

#### **FSUZ0109**

failed to find end of command substitution

# **Explanation**

A system error indicating the cause is displayed with this message.

# **System action**

Command terminates.

#### **User response**

Ensure that the command is enclosed as follows, \$ \$(command) or 'command'.

#### FSUZ0110

failed to find end of math substitution

#### **Explanation**

A system error indicating the cause is displayed with this message.

# **System action**

Command terminates.

# **User response**

Ensure that the math expression is enclosed in the correct form.

#### **FSUZ0111**

failed to retrieve groups for user: number

# **Explanation**

The user *number* is not a member of any group.

### **System action**

Command terminates.

#### **User response**

Ensure that the user *number* is a member of a group or groups.

#### FSUZ0112

#### failed to write history file string.new: number

# **Explanation**

A system error indicating the cause is displayed with this message.

# **System action**

Command terminates.

#### **User response**

Check the errno or contact your system programmer.

#### **FSUZ0113**

failed to write history file string: number

### **Explanation**

A system error indicating the cause is displayed with this message.

# **System action**

Command terminates.

#### **User response**

Check the errno or contact your system programmer.

#### **FSUZ0114**

#### fatal error: out of heap memory

#### **Explanation**

A memory allocation failed with the error indicated.

# **System action**

Command terminates.

### **User response**

This message could indicate that the user heap is exhausted. For more information about heap tuning, see z/OS C/C++ Runtime Library Reference.

#### **FSUZ0115**

#### fatal error: out of memory

#### **Explanation**

There was not enough free system resources to allocate as internal buffers.

### **System action**

Command terminates.

#### **User response**

Free up more system resources and try again.

#### **FSUZ0116**

file descriptor out of range

#### **FSUZ** messages

# **Explanation**

The file descriptor is negative.

# **System action**

Command terminates.

#### **User response**

Ensure that the file descriptor is valid.

#### **FSUZ0117**

#### File mode mismatch on fd number

# **Explanation**

Internal error --- The file mode of the new file descriptor did not match the file mode of the original file descriptor.

# **System action**

Command terminates.

#### **User response**

Check the FD\_SETSIZE and increase it accordingly. For more information, see z/OS C/C++ Runtime Library Reference.

#### **FSUZ0118**

#### file number expected

# **Explanation**

Tried to redirect to the file "<&n".

#### **System action**

Command terminates.

#### **User response**

Redirect to the expected file number.

**FSUZ0119** 

#### fork failed: reasoncode

#### **Explanation**

A system error indicating the cause is displayed with this message.

### **System action**

Command terminates.

#### **User response**

Take appropriate action based on reason code.

FSUZ0120

here document too large

Failed to convert the document into a string due to the large file size.

### **System action**

Command terminates.

#### **User response**

Ensure that the document is not too large.

#### **FSUZ0121**

#### history event too long, can't index requested words

# **Explanation**

The history event was too long, which made the history command query fail.

# **System action**

Command terminates.

#### **User response**

Provide a valid history event.

**FSUZ0122** 

illegal modifier: character

### **Explanation**

An error occurred when performing history expansion.

### **System action**

Command terminates.

#### **User response**

Use valid modifiers.

#### **FSUZ0123**

invalid base (must be 2 to 36 inclusive): number

#### **Explanation**

An error occurred when evaluating the math expression.

### **System action**

Command terminates.

#### **User response**

Ensure that the base is within the specified range.

FSUZ0124 invalid length: string

#### **Explanation**

An error occurred when performing parameter substitution.

# **System action**

Command terminates.

#### **User response**

Ensure that the statement is in the form of \${PARAM:OFFSET} or \${PARAM:OFFSET:LENGTH}.

#### **FSUZ0125**

invalid mode specification

#### **Explanation**

An error occurred when performing filename globbing.

# **System action**

Command terminates.

#### **User response**

Ensure that the file permissions or modes are valid.

#### **FSUZ0126**

invalid module name "string"

### **Explanation**

An error occurred when loading a module.

### System action

Command terminates.

#### **User response**

Ensure that the module name contains only valid characters: those allowed in a shell identifier plus slash.

# **FSUZ0127**

invalid pattern "string"

# **Explanation**

invalid pattern "string"

#### **System action**

Command terminates.

#### **User response**

Ensure that the provided pattern is valid.

### **FSUZ0128**

invalid subscript

# **Explanation**

An error occurred when handling the subscript.

# **System action**

Ensure that the subscript is valid.

**FSUZ0129** 

invalid subscript: string

# **Explanation**

An error occurred when performing parameter substitution.

#### **System action**

Command terminates.

### **User response**

Ensure that the statement is in the form of \${PARAM:OFFSET} or \${PARAM:OFFSET:LENGTH}.

**FSUZ0130** 

invalid syntax for process substitution in redirection

# **Explanation**

A system error indicating the cause is displayed with this message.

# **System action**

Command terminates.

#### **User response**

Check the syntax for process substitution in redirection.

**FSUZ0131** 

invalid use of [key]=value assignment syntax

#### **Explanation**

An error occurred when setting a parameter.

# **System action**

Command terminates.

#### **User response**

The [key]=value syntax must be strictly followed when setting a parameter.

**FSUZ0132** 

invalid zle register: string

### **Explanation**

An error occurred when setting the zle register.

# **System action**

Command terminates.

#### **User response**

Ensure that the register is valid or contact your system programmer.

#### **FSUZ0133**

#### job table full or recursion limit exceeded

# **Explanation**

Did not get a free entry in the job table and initialize it because the job table was full or the recursion limit was exceeded.

#### **System action**

Command terminates.

#### **User response**

Contact your system programmer or follow local procedures for reporting problems to IBM.

**FSUZ0134** 

job table full

# **Explanation**

Internal error --- the job table was full.

# **System action**

Command terminates.

#### **User response**

Follow local procedures for reporting problems to IBM.

**FSUZ0135** 

locking failed for string: number

#### **Explanation**

Failed to lock history file.

#### System action

Command terminates.

#### **User response**

Check the attribute of history file or contact your system programmer.

**FSUZ0136** 

lost current directory, failed to cd to /: number

#### **Explanation**

Current directory was unreadable and cd to root.

#### System action

Command terminates.

#### **User response**

Provide the correct directory or contact your system programmer for the directory permission.

**FSUZ0137** 

lost current directory: number: changed to 'string'

Current directory was unreadable and cd to the home directory.

### **System action**

Command terminates.

#### **User response**

Provide the correct directory or contact your system programmer for the directory permission.

#### **FSUZ0138**

math recursion limit exceeded: string

# **Explanation**

The function was defined with too many levels of recursion.

# **System action**

Command terminates.

#### **User response**

Simplify the function to use fewer levels of recursion.

#### **FSUZ0139**

maximum nested function level reached; increase FUNCNEST?

### **Explanation**

The function is nested too deeply.

### **System action**

Command terminates.

#### **User response**

Simplify the function or contact your system programmer.

#### FSUZ0140

missing delimiter for 'g' glob qualifier

#### **Explanation**

'g' glob was specified but was not delimited.

### **System action**

Command terminates.

#### **User response**

Provide a delimiter for the 'g' glob qualifier.

#### **FSUZ0141**

missing delimiter for 'g' glob qualifier

### **Explanation**

'g' glob was specified but was not delimited.

#### **FSUZ** messages

#### **System action**

Command terminates.

#### **User response**

Provide a delimiter for the 'g' glob qualifier.

FSUZ0142

missing end of string

### **Explanation**

An error occurred when getting a glob string for execution.

# System action

Command terminates.

### **User response**

Provide the missing string.

**FSUZ0143** 

missing identifier after '+'

# **Explanation**

A identifier was expected after '+' when getting a glob string for execution.

### **System action**

Command terminates.

#### **User response**

Provide the missing identifier.

FSUZ0144

modifier failed: A

# **Explanation**

Error on resolving symlinks when performing history substitution.

#### **System action**

Command terminates.

#### **User response**

The realpath for symlinks cannot be resolved. Make sure that the real path for symlinks is valid.

**FSUZ0145** 

modifier failed: a

# **Explanation**

Error on resolving absolute path when performing history substitution.

# **System action**

Check the path in the statement.

**FSUZ0146** 

modifier failed: a

#### **Explanation**

Error on doing history expansion when resolving the path.

# **System action**

Command terminates.

# **User response**

Check the path in the statement.

**FSUZ0147** 

modifier failed: e

# **Explanation**

The attempt to remove all but the trailing suffix failed.

# **System action**

Command terminates.

#### **User response**

Check the path in the statement.

FSUZ0148

modifier failed: h

### **Explanation**

Remove a trailing file name component, leaving only the head failed.

# **System action**

Command terminates.

### **User response**

Check the path in the statement.

**FSUZ0149** 

modifier failed: r

### **Explanation**

The attempt to remove a trailing suffix of the form .xxx, leaving only the basename, failed.

### **System action**

Command terminates.

#### **User response**

Check the path in the statement.

**FSUZ0150** 

modifier failed: t

# **Explanation**

Remove all leading file name components, leaving the tail.

# System action

Command terminates.

#### **User response**

Check the path in the statement.

**FSUZ0151** 

Multio failed for fd number: number

# **Explanation**

Internal error --- multio failed.

# **System action**

Command terminates.

#### **User response**

Check the FD\_SETSIZE and increase it accordingly. For more information, see z/OS C/C++ Runtime Library Reference.

**FSUZ0152** 

nested associative arrays not yet supported

#### **Explanation**

The attempt to set nested associative arrays failed.

### **System action**

Command terminates.

#### **User response**

Use valid parameter or variable assignment command.

**FSUZ0153** 

no directory expansion: ~[string]

#### **Explanation**

There was no directory expansion ~[string].

# System action

Command terminates.

#### **User response**

Provide a valid directory name.

**FSUZ0154** 

no match

An error occurred when executing a command or glob entries of a linked list.

# **System action**

Command terminates.

#### **User response**

Contact your system programmer.

FSUZ0155

no matches found: string

# **Explanation**

An error occurred when performing filename globbing.

# **System action**

Command terminates.

#### **User response**

Contact your system programmer.

**FSUZ0156** 

no previous substitution

#### **Explanation**

An error occurred when handling colon modifiers or "&&" modifier when performing history expansion.

### **System action**

Command terminates.

#### **User response**

Check the syntax or contact your system programmer.

**FSUZ0157** 

no such event: number

#### **Explanation**

An error occurred when getting the specified history entry.

### **System action**

Command terminates.

#### **User response**

Ensure that the specified history event is valid.

**FSUZ0158** 

no such event: string

#### **Explanation**

An error occurred when performing history expansion.

#### **FSUZ** messages

#### **System action**

Command terminates.

#### **User response**

Ensure that the specified history event is valid.

**FSUZ0159** 

no such function: string

### **Explanation**

An error occurred when evaluating the specified mathematical expression.

# System action

Command terminates.

### **User response**

Ensure that the specified function is valid.

**FSUZ0160** 

no such option: string

### **Explanation**

An invalid option was specified.

### System action

Command terminates.

#### **User response**

Provide a valid option.

FSUZ0161

no such user or named directory: string

# **Explanation**

There was no such user or named \$ directory and option NOMATCH or EXECOPT was not turned on.

#### **System action**

Command terminates.

#### **User response**

Provide a valid directory name or turn on option NOMATCH or EXECOPT.

**FSUZ0162** 

no such word in event

# **Explanation**

An error occurred when performing history expansion.

#### **System action**

Ensure that the word in the history entry is valid.

**FSUZ0163** 

not an identifier: string

### **Explanation**

An nonalphanumeric name was used as an identifier.

### **System action**

Command terminates.

# **User response**

Use only alphanumeric names for identifiers.

FSUZ0164

not enough directory stack entries.

#### **Explanation**

Failed to get a directory stack entry because there were not enough directory stack entries.

# **System action**

Command terminates.

#### **User response**

Ensure that the directory name is valid or follow local procedures for reporting problems to IBM.

FSUZ0165

Command continue not in while, until, select, or repeat loop

#### **Explanation**

Command continue is only permitted in loops.

# **System action**

Command terminates.

#### **User response**

Ensure that command continue is located in loops.

**FSUZ0166** 

not login shell

### **Explanation**

Command logout was invalid because it was not the login shell.

### **System action**

Command terminates.

#### **User response**

Ensure that it is the login shell.

C	c	П	7	<u>01</u>	67	
_	3	u	_	u i	n,	

not valid in this context: string

# **Explanation**

Failed to set a parameter because the parameter name was not valid.

# **System action**

Command terminates.

#### **User response**

Ensure that parameter name is valid.

**FSUZ0168** 

number expected

# **Explanation**

A number is expected.

# **System action**

Command terminates.

#### **User response**

Provide the missing number.

**FSUZ0169** 

Only one tied parameter can have value: string

# **Explanation**

Attempted to assign value to the parameter which was not tied one.

# **System action**

Command terminates.

# **User response**

Reissue a valid builtin command.

**FSUZ0170** 

out of memory in arrayuniq

#### **Explanation**

There was not enough free system resources to allocate as internal buffers.

### **System action**

Command terminates.

#### **User response**

Free up more system resources and try again.

**FSUZ0171** 

parameter name reference used with array

Attempted to use array as the reference of parameter name.

### **System action**

Command terminates.

#### **User response**

Provide a valid parameter name reference.

#### **FSUZ0172**

parameter not set

# **Explanation**

An error occurred because the parameter was not set and the UNSET option was not set.

# **System action**

Command terminates.

#### **User response**

Ensure that the parameter is set or the UNSET option is set.

#### **FSUZ0173**

parse error in \${...character....} substitution

### **Explanation**

There was a parse error in \$ \${...character....} parameter substitution.

### **System action**

Command terminates.

#### **User response**

Provide the correct parameter which includes \$ \${...character....}.

#### **FSUZ0174**

parse error in command substitution

#### **Explanation**

There was a parse error in command substitution.

### **System action**

Command terminates.

#### **User response**

Provide the correct command.

#### **FSUZ0175**

parse error in parameter value

#### **Explanation**

There was a parse error in the parameter value.

# **FSUZ** messages **System action** Command terminates. **User response** Provide a valid parameter value. **FSUZ0176** parse error in process substitution **Explanation** There was a error in command string parsing. **System action** Command terminates. **User response** Provide the correct command. **FSUZ0177** parse error near 'character' **Explanation** There was a parse error near *character*. **System action** Command terminates. **User response** Provide the correct input near character. **FSUZ0178** parse error **Explanation** There was a error in parsing string.

# **System action**

Command terminates.

# **User response**

Provide the correct string.

FSUZ0179 pipe failed: number

# **Explanation**

Failed to execute a pipeline.

# **System action**

Ensure that the pipe command is correct or contact your system programmer.

#### **FSUZ0180**

#### process substitution string cannot be used here

#### **Explanation**

Attempted to do command substitution without a foreground job.

### **System action**

Command terminates.

# **User response**

Ensure that the process is valid or contact your system programmer.

#### **FSUZ0181**

process substitution failed: number

#### **Explanation**

Failed to open an output file during command substitution.

# **System action**

Command terminates.

#### **User response**

Ensure that the process is valid or contact your system programmer.

#### FSUZ0182

read error on string

#### **Explanation**

An error occurred when reading from the file.

# **System action**

Command terminates.

#### **User response**

Refer to the system error message and take appropriate action.

#### **FSUZ0183**

read-only variable: string

### **Explanation**

An error occurred when changing the values of some environment variables, such as HOME and so on.

### **System action**

Command terminates.

#### **User response**

Do not try to change the value of read-only variables.

**FSUZ0184** 

read-only variable: 0

# **Explanation**

Cannot change the value of special parameter '0' because \$0 becomes read-only under POSIXARGZERO.

# **System action**

Command terminates.

#### **User response**

Do not try to change the value of read-only variables.

**FSUZ0185** 

redirection with no command

### **Explanation**

An error occurred when executing a command.

# **System action**

Command terminates.

#### **User response**

Refer to the system error message and take appropriate action.

**FSUZ0186** 

rewriting string would change its ownership -- history not saved

# **Explanation**

The history was not saved because rewriting the history file would change its ownership.

# **System action**

Command terminates.

# **User response**

Do not rewrite the history file.

**FSUZ0187** 

rewriting string would change its ownership -- skipped

#### **Explanation**

The history saving was skipped because rewriting history file would have changed its ownership.

### **System action**

Command terminates.

#### **User response**

Do not rewrite the history file.

**FSUZ0189** 

stack overflow

Attempted to specify a math expression that was too complicated for the stack to handle.

# **System action**

Command terminates.

#### **User response**

Try to simplify the expression.

#### **FSUZ0190**

string inserting another one too many times

# **Explanation**

Failed to read a command from the current keymap due to string inserting another one too many times.

# **System action**

Command terminates.

#### **User response**

Reduce hops of string inserting another one.

#### FSUZ0192

substitution failed

### **Explanation**

There was an error in history command substitution.

### **System action**

Command terminates.

#### **User response**

Provide a valid history command or contact your system programmer.

#### **FSUZ0193**

substring expression: number

#### **Explanation**

Internal error --- failed to locate substring expression in parameter substitution.

#### **System action**

Command terminates.

#### **User response**

Follow local procedures for reporting problems to IBM.

#### **FSUZ0194**

too many glob sort specifiers

#### **Explanation**

An error occurred when performing filename globbing.

#### **FSUZ** messages

#### **System action**

Command terminates.

#### **User response**

Provide a valid number of glob sort specifiers.

FSUZ0195

unable to resolve non-numeric username 'string'

# **Explanation**

An error occurred when performing filename globbing.

# System action

Command terminates.

### **User response**

Provide a numeric username.

**FSUZ0196** 

unknown exec flag -character

# **Explanation**

Unknown exec flag.

### **System action**

Command terminates.

### **User response**

Provide a valid exec flag.

**FSUZ0197** 

unknown file attribute: character

# **Explanation**

Unknown file attribute when doing filename globbing.

### System action

Command terminates.

#### **User response**

Provide a valid file attribute.

**FSUZ0198** 

unknown function: string

# **Explanation**

Unknown function when calling math function.

#### **System action**

Provide a valid math function.

#### FSUZ0199

unknown group

#### **Explanation**

You specified a groupname that was not in the system group database.

### **System action**

Command terminates.

# **User response**

Use the **id** command to get a list of all groups you can access.

#### FSUZ0200

unknown sort specifier

# **Explanation**

Unknown sort specifier when performing glob sorting on filenames.

# **System action**

Command terminates.

#### **User response**

Provide a valid sort specifier.

#### FSUZ0201

unknown username 'string'

#### **Explanation**

Unknown username when doing filename globbing.

# **System action**

Command terminates.

### **User response**

Provide a valid username.

#### **FSUZ0202**

unmatched character

# **Explanation**

There is a unmatched '%c' in the statement that does not have a corresponding '%c' to terminate it.

### **System action**

Command terminates.

#### **User response**

Ensure that there is a corresponding '%c' in the statement to match the existing one.

FSI	17	$\overline{\alpha}$	$\overline{n}$
FDL	JZ	uz	U.5

#### unrecognized modifier 'character'

#### **Explanation**

The statement contains an invalid modifier '%c' that cannot be recognized by zsh.

# System action

Command terminates.

#### **User response**

Remove '%c' or check the syntax and logic of the statement.

FSUZ0204

unrecognized modifier

# **Explanation**

You specified an invalid modifier that cannot be recognized by zsh.

### **System action**

Command terminates.

#### **User response**

Check the syntax and logic of the statement.

FSUZ0205

unterminated 'string...)'

# **Explanation**

The expression was parsed inside another construct.

### **System action**

Command terminates.

#### **User response**

Provide the string termination.

**FSUZ0206** 

use 'exit' to exit.

#### **Explanation**

"exit" was not used to exit zsh.

# **System action**

Command terminates.

#### **User response**

Use "exit" to exit zsh.

**FSUZ0207** 

use unset to remove tied variables

An attempt was made to use an unset command

# **System action**

Command terminates.

### **User response**

Use a valid typeset or unset command.

FSUZ0208

value too big: Ystring

# **Explanation**

An error occurred when performing filename globbing: too many files to match causing the integer overflow.

# **System action**

Command terminates.

#### **User response**

Try to narrow down the matching condition.

FSUZ0209

wait failed: number

### **Explanation**

An error occurred when waiting for a process.

### **System action**

Command terminates.

# **User response**

Ensure that the process is valid or contact your system programmer.

FSUZ0210

write error

### **Explanation**

An error occurred when handling a file.

### System action

Command terminates.

#### **User response**

Check the file permission.

**FSUZ0211** 

wrong number of arguments: string

#### **Explanation**

Too few or too many arguments were provided.

#### **System action**

Command terminates.

#### **User response**

Use the correct number of arguments.

#### FSUZ0212

you have running jobs.

### **Explanation**

Running jobs in the shell are preventing you from exiting.

# System action

Command terminates.

#### **User response**

To find out what jobs are running, issue the 'jobs' command and kill these jobs.

#### **FSUZ0213**

you have stopped jobs.

# **Explanation**

Stopped jobs in the shell are preventing you from exiting.

### System action

Command terminates.

#### **User response**

To find out what jobs are stopped, issue the 'jobs' command and either resume or kill these jobs.

#### FSUZ0214

you have suspended jobs.

# **Explanation**

Suspended jobs in the shell are preventing you from exiting.

#### **System action**

Command terminates.

#### **User response**

To find out what jobs are suspended, issue the 'jobs' command and either resume or kill these jobs.

### **FSUZ0215**

Your system did not implement the select system call.

# **Explanation**

A system call was specified that is not implemented in your system.

#### **System action**

## User response

Use a system call that is implemented.

# pedb and pedbx debugger messages

## **FOMOG**

FOMOG0002

string <number>: Data Display data is not attached to data window [number][number].

#### **Explanation:**

Cannot access information to update the data window.

## **System action:**

Further data viewing will be limited.

FOMOG0013

Range index value *number* is out of bounds. The index value must be within the range between *number* and *number*.

#### **Explanation:**

You have entered an index that is not within the range of acceptable values for the array selected.

### **System action:**

Enter an array range index that is within the range of acceptable values specified at the top of the window.

FOMOG0014

Minimum array element number is greater than maximum element number.

### **Explanation:**

You have entered an array range value for minimum index that is greater than maximum index.

## System action:

Re-enter a value for minimum that is within the correct range.

#### FOMOG0019

#### An unrecognized section of the manual has been entered.

#### **Explanation:**

A string was chosen or typed in to select a section of a manual. The string did not match any of the manual sections listed in the window.

### **System action:**

Correct the string in the choice field so it matches one of sections listed under manual selections, and then press <Enter> or click on the OK or Apply button. You could also select a section by clicking with the left mouse button on a section listed under manual selections, and then press the OK or Apply button to bring up the section under InfoExplorer.

## FOMOG0021

#### An unrecognized online help index has been chosen.

## **Explanation:**

A string was chosen or typed in to select a section of the online help. The string did not match any of the online help sections listed in the window.

## **System action:**

Correct the string in the choice field so it matches the entry in the online help sections that you wish to choose, and press <Enter> or click on the OK or Apply button.

## FOMOG0030

### Only array ranges with up to *number* elements can be specified.

#### **Explanation:**

You have specified an array range that would select more than the maximum allowable array elements. You may only look at a maximum of 1000 elements at a time even if the array is larger than that.

## **System action:**

### **FOMOG** messages

Either enter values for minimum and maximum that define a smaller range of elements, or use a larger value for stride to select fewer array elements within the sub-range.

#### FOMOG0033

No source file is available for task: number.

### **Explanation:**

pedb could not locate a source file to correspond with where the program on this task is stopped. Consequently no source file for this task will appear in the source file window.

### **System action:**

pedb processing will continue. You can select a source file using the Get Source File option from the File pull-down or by double clicking on a stack entry which contains a source file name.

#### FOMOG0034

No source file is available to edit.

### **Explanation:**

pedb could not locate a source file to edit. Pressing the edit button causes an edit window to be displayed containing the file that is currently displayed in the pedb source window. Since there is no source file to edit, the edit window will not be displayed.

#### **System action:**

Normal pedb processing will continue.

FOMOG0035

No task(s) selected.

#### **Explanation:**

The context has not been set to a task or a task group.

### **System action:**

Press a task or group button to set the current context.

#### FOMOG0036

The STOP function is not available, since pedb is not in PLAY mode.

## **Explanation:**

The STOP function is only available when PLAY mode is active. Its purpose is to cancel PLAY mode. The case may be that the stop button was pressed while play mode was in the process of stopping.

#### **System action:**

None. This is an informational message.

#### FOMOG0041

Cannot send a request to the remote debugger when a task is RUNNING or PLAYING. No action has been taken on any task.

### **Explanation:**

pedb cannot process your request when the task of the current context is RUNNING or PLAYING. You may have tried to create or delete breakpoints, or tried to press the single step or continue buttons. pedb can only process requests when the task is in DEBUG READY state.

### **System action:**

You should resend the request when the task is in a DEBUG READY state.

## FOMOG0043

Cannot send a request to the following task(s): *string*. No action has been taken on these tasks.

## **Explanation:**

A request has been issued for all tasks in the current context in DEBUG READY state. pedb cannot process your request until all tasks in the current context are in DEBUG READY state. Setting or deleting breakpoints, clicking on STEP OVER, STEP INTO or CONTINUE are examples of actions that cause requests to be sent to all tasks in the current context. You may have tried to create or delete breakpoints, or tried to press the single step or continue buttons. pedb can only process requests when all tasks in the current context are in DEBUG READY state, otherwise, the request is ignored.

### **System action:**

You should resend the request when the task(s) are in DEBUG READY state.

## FOMOG0044

Shell script string could not be located, or can not be executed.

## **Explanation:**

The named shell script could not be located in the default directory, /bin or the user directory if specified by environment variable MP\_DEBUG\_BIN\_DIR.

### **System action:**

Verify that the script is available and has the appropriate permissions to be executed by your login. If MP\_DEBUG\_BIN\_DIR is set, make sure that the named script exists and has the proper permissions or that it does not exist so that the default script supplied with the debugger can be executed.

#### FOMOG0050

An invalid value: "string" was specified for the Play Delay. Please enter a non-negative integer value. If you click on Cancel, the new delay field will be reset to the previous value of number.

### **Explanation:**

An invalid value for the play delay has been entered. Only non-negative integers are valid.

### **System action:**

Specify a non-negative integer value for the play delay in tenths of seconds.

### FOMOG0051

string number: Could not resolve mouse selection to a stack entry.

### **Explanation:**

Internal error: You have double-clicked on an entry in a stack window and pedb cannot resolve your selection to a call stack index. No action has been taken, pedb continues processing.

### **System action:**

Gather information about the problem and follow local site procedures for reporting hardware and software problems.

#### FOMOG0052

Cannot read attach configuration file.

#### **Explanation:**

pedb could not read the attach configuration file, which is created when the original POE job was started, and is removed when the job ends.

# **System action**

- 1. Make sure the correct POE process id was used when invoking the debugger.
- 2. Check the /tmp directory for the existence of a configuration file containing the POE process id. (For example, check /tmp/.ppe.<poe; pid>.attach.cfg;).

#### FOMOG0053

No tasks listed in attach configuration file.

#### **Explanation:**

The attach configuration file created when the original POE job was started contained a zero in the first field indicating that POE is between job steps.

### **System action:**

Wait for the next job step to start which will take a few seconds. Then you can re-enter pedb in attach mode, if you wish.

## FOMOG0054

Cannot open attach configuration file.

#### **Explanation:**

pedb was unable to open the attach configuration file.

## **System action**

- 1. Make sure that the correct POE process id was used when invoking the debugger.
- 2. Check the /tmp directory for the existence of a configuration file containing the POE process id. For example, check for /tmp/.ppe.34192.attach.cfg.

## FOMOG0055

You are not allowed to delete group "Attached".

#### **Explanation:**

The default group when running in attach mode, "Attached", is not allowed to be deleted.

None. This is an informational message.

#### FOMOG0056

Missing or invalid argument to -a flag. For information on the correct syntax to use when invoking pedb, type: pedb -h

#### **Explanation:**

The -a flag requires an integer argument specifying the process identifier of the POE process.

#### **System action:**

Specify the POE process id when using the -a flag. For example, specify pedb -a 34192.

#### FOMOG0057

Task number has been detached.

#### **Explanation:**

A reply was received from the debug engine (dbe) that indicated the specified task has been detached.

#### **System action:**

None. This is an informational message.

#### FOMOG0058

Attached to task number.

#### **Explanation:**

The specified task has been attached by the debugger.

### **System action:**

None. This is an informational message.

#### FOMOG0059

Debugger attached and ready.

#### **Explanation:**

All of the specified tasks have been attached, and you are able to start debugging.

### **System action:**

None. This is an informational message.

## FOMOG0060

pedb Attatch Window

## **Explanation:**

This is the Attach Window help message.

#### **System action:**

None.

## FOMOG0061

Task *number*: The following situation occurred on the remote debug engine: string

#### **Explanation:**

An error condition was detected by the remote debug engine on this task. The information following this message is from the remote debug engine, and contains information regarding the nature of the problem that occurred at that level.

#### **System action:**

If the information provided by the remote debug engine is not sufficient to allow you to rectify the problem, gather all relevant details and follow local site procedures for reporting hardware and software problems.

## FOMOG0062

The following flag(s) are not valid when starting the debugger in attach mode - 'string'. Please check for valid flags and retry.

#### **Explanation:**

The user attempted to start pedb in attach mode with a command line flag(s) that is not valid. The error message is given and the debugger exits.

#### **System action:**

The user should check for valid command line flags and try again.

## FOMOG0063

The following environment variables have been ignored since they are not valid when starting the debugger in attach mode - 'string'.

Some of the environment variables the user has set are not valid when starting pedb in attach mode. A message is given indicating what variables have been ignored. The debugger continues.

### **System action:**

Note any environment variable of interest that have been ignored. This message exists to highlight the fact that some of the environment variables that normally have an effect when the POE job is initially started will not have an affect by having them set when the debugger is invoked for attach.

## FOMOG0064

## Error creating temporary file 'string'.

### **Explanation:**

When starting pedb in attach mode, a temporary host.list file is created, consisting of only the tasks that you selected to attach to. This temporary host.list file is created in /tmp by default, unless you specify a different directory with the TMPDIR environment variable. The naming convention for this file is: </tmpdir>/.pedb.<ppe-pid>host.list; where </tmpdir> is either /tmp, or the directory specified by the TMPDIR environment variable, if it has been defined, and where <ppe-pid> is the process ID of the poe job to be attached to. The message that you received appears when the temporary host.list file cannot be opened, or when errors are detected while writing to the file.

### **System action:**

Verify that there is enough space available in the /tmp filesystem, or if you have specified a directory with the TMPDIR environment variable, check the filesystem that contains this directory for sufficient space. You may also want to check to be sure that a file of the same name does not already exist.

### FOMOG0065

## Could not open socket for debugger to communicate with poe.

## **Explanation:**

The socket() call failed when the debugger tried to set up communications with POE.

## **System action:**

Debugging can continue except that the information about synchronized exit will not be passed back to the debugger from the POE job. Please note that the debugger will most likely not be able to re-attach to this POE job after detaching.

## FOMOG0066

#### Could not make socket connection to poe.

#### **Explanation:**

The connect() call failed when the debugger tried to set up communications with POE. The information about a synchronized exit is not passed back to the debugger from the POE job. The debugger probably cannot re-attach to this POE job after detaching.

## **System action:**

You can continue debugging with limited function. Please note that the debugger probably cannot re-attach to this POE job after detaching.

## FOMOG0067

## Could not read message from poe.

#### **Explanation:**

pedb was unable to read data from the POE debug socket.

### **System action:**

Debugging can continue except that the information about synchronized exit may not be passed back to the debugger from the POE job. Please note that the debugger will most likely not be able to re-attach to this POE job after detaching.

## FOMOG0068

#### Could not write to poe debug socket.

#### **Explanation:**

pedb was unable to write to the POE debug socket.

## **System action:**

The debugger was unable to communicate to POE that the debugger is detaching. Please note that the debugger will most likely not be able to re-attach to this POE job.

#### FOMOG0069

An instance of pedb has already been attached to this POE job.

Only one instance of the debugger may be attached to a given POE job at a time. The existence of the /tmp/.pedb.cpoe-pidhost.list; file indicates that a debugger has already attached to this POE job.

### **System action:**

If pedb isn't currently attached to the POE job in question, remove the corresponding /tmp/.pedb.cpoe-pid>.host.list; file in /tmp, and try again.

#### FOMOG0070

Could not locate poe configuration file - 'string'.

### **Explanation:**

pedb was unable to locate the POE configuration file.

### **System action:**

Check to see if the desired POE job is running and if the configuration file was created in /tmp. (For example, check for a /tmp/.ppe.34192.attach.cfg file, where 34192 would be the process id of the POE job.

#### FOMOG0071

The information in the poe configuration file has been modified and therefore the old information is no longer valid. This is most likely due to a POE job step ending.

#### **Explanation:**

The POE configuration file, /tmp/.ppe.<poe-pid>.attach.cfg, was modified.

#### **System action:**

Restart the debugger in attach mode to debug the next POE job step.

#### FOMOG0072

All tasks have exited. Select OK to detach.

### **Explanation:**

All the tasks in the partition have completed program execution. Selecting OK causes pedb to detach from the program and exit. An alternative would be to click on Cancel and then select the Quit option from the File pull-down menu. Please note that this method would kill the POE job as well as causing pedb to exit.

## **System action:**

As mentioned above, clicking on this window, and then select the File->Quit option to kill the program and exit the debugger.

### FOMOG0073

Missing or invalid argument following the -I flag. For information on the correct syntax to use when invoking pedb, type: pedb -h

#### **Explanation:**

The -I flag requires the name of a directory that pedb will search for source code files. This argument was missing or invalid.

## **System action:**

Specify the name of a directory following the -I flag. This directory should be available to each task in your partition because the -I flag will be passed to each remote dbx debugger.

## FOMOG0074

Missing or invalid argument following the -d flag. For information on the correct syntax to use when invoking pedb, type: pedb -h

### **Explanation:**

The -d flag requires an integer argument that specifies the nesting depth limit of program blocks.

## **System action:**

Specify an integer. Note that this overrides the default nesting depth limit of 25 program blocks.

#### FOMOG0100

The Load command is ignored because the task *number* is already loaded.

#### **Explanation:**

This task has already been loaded with a program.

## **System action:**

If the wrong executable has been loaded for a particular task then pedb will have to be restarted.

#### FOMOG0101

Your program has been loaded.

This message is issued when your program has been loaded into the tasks in the partition. This message indicates all the functions available in pedb are available for you to use.

### **System action:**

When this message is displayed, you can start debugging on all the tasks in the partition.

### FOMOG0104

Cannot find executable 'string'.

## **Explanation:**

pedb could not find the specified executable file.

## **System action:**

Check that the name and path of the program to be debugged are entered correctly, and verify that the file has the proper permissions.

## FOMOG0105

Cannot execute 'string'.

### **Explanation:**

The file to be debugged is not executable by this userid.

### **System action:**

Check the file permissions, and the results of the id command to ensure that you can execute the file. You may have to change your group or the file permissions.

## FOMOG0107

Press a task or group button, because there is no current context.

## **Explanation:**

There is no defined context to execute on.

#### **System action:**

Select a context and re-execute the function.

#### FOMOG0109

string

## **Explanation**

This message is formatted dynamically from the string you are searching for, and the direction of the search.

Message format is: Searched to the imit> of the file and did not find <string>;

For example: User specifies a string of my\_variable in this find window. If using the First or Next option, the message text will be: Searched to the end of the file and did not find my\_variable. If using Previous or Last, the message text will be: Searched to the top of file and did not find my\_variable.

## System action:

Try specifying a different string or use the case sensitive button to ignore case when searching. To search from a different starting point in the text, scroll to that general area, and then left click on the desired starting line.

## FOMOG0110

No source file is available for task: number, thread: number.

#### **Explanation:**

pedb could not locate a source file to correspond with where the program on this task and thread is stopped. Consequently no source file for this task and thread will appear in the source file window.

## **System action:**

pedb processing will continue. You can select a source file using the Get Source File option from the File pull-down or by double clicking on a stack entry which contains a source file name.

## FOMOG0111

Could not locate source file: string for task: number, thread: number.

### **Explanation:**

pedb could not locate a source file to correspond with the current program state in this task and thread. Consequently no source file for this task and thread will appear in the source file window.

## System action:

Check the source file search path and file permissions. pedb processing will continue.

### FOMOG0112

Unable to open file "string" for task number, thread number.

pedb was not able to open the file for reading or determined that the selected file was not a regular file ( such as a directory or device ).

### **System action:**

This typically occurs when manually selecting a new source file for the source window. In this case, the user should check that the filename is valid and the proper permissions are in effect to allow it to be read. If this message occurs because the debugger stopped in a new source file, one may also want to check the source search path using the Source Path window under File on the menu bar. pedb will display no source if it stops in a file it can not read.

#### FOMOG0113

Source file: *string* on task: *number*, thread *number* is larger than the maximum allowable size, which is 65534 lines.

## **Explanation:**

pedb could not load the entire source file into the buffer used to process the Source File window. If you started pedb in normal mode, both pedb and the program will terminate. If you are using pedb in attach mode, pedb will detach from the program and exit, but the program will not be terminated.

### **System action:**

If you want the ability to debug all the source code for this program, split the code into multiple files, with each file being less than 65535 lines. After completing this, recompile the program.

#### FOMOG0114

Array *string* on task *number*, thread *number* has a different number of dimensions. It is excluded from the export.

## **Explanation:**

The array with a matching array name on the specified task and thread does not meet the match criteria and is excluded from the export.

## **System action:**

The user must be aware of the match criteria when trying to allow multiple matching arrays to exported at the same time.

#### FOMOG0115

Array *string* on task *number*, thread *number* has a different minimum range. It is excluded from the export.

#### **Explanation:**

The array with a matching array name on the specified task and thread does not meet the match criteria and is excluded from the export.

#### **System action:**

The user must be aware of the match criteria when trying to allow multiple matching arrays to exported at the same time.

#### FOMOG0116

Array *string* on task *number*, thread *number* has matched. It is included in the export.

#### **Explanation:**

This informational message indicates that this particular array has met the match criteria and will be included in the export.

## **System action:**

Continue normal pedb operations because this message indicates successful processing.

## FOMOG0117

No matching array found on task number, thread number.

#### **Explanation:**

No arrays that meet any of the matching criteria have been found on this task and thread.

#### **System action:**

The user must be aware of the match criteria when trying to allow multiple matching arrays to exported at the same time.

## FOMOG0118

pedb does not support message queue debugging for the non-threaded MPI library.

Informational message that appears when the user attempts to get message request queue data from an application which is using the non-threaded MPI library.

## **System action:**

None.

## FOMOG0119

The version of the MPI library being used is not supported by this version of the debugger.

#### **Explanation:**

An informational message indicating that the version of the debugger being used cannot interpret data from the version of MPI being used.

### **System action:**

None.

## FOMOG0120

The version of the MPCI library being used is not supported by this version of the debugger.

#### **Explanation:**

An informational message indicating that the version of the debugger being used cannot interpret data from the version of MPCI being used.

#### **System action:**

None.

## FOMOG0121

The MPI application has not been run in debug mode, therefore, there will be no data on blocking calls and no time-stamp information.

#### **Explanation:**

Some MPI debugging data is only collected when MPI is run in DEBUG mode.

### **System action:**

See the documentation concerning the setting of the MP\_EUIDEVELOP environment variable.

#### FOMOG0122

Could not create a new request record.

#### **Explanation:**

This is an internal debugger error most likely caused by either a memory allocation failure or the fact that the record already exists.

#### **System action:**

Try canceling the message queue debugging windows and starting over again. If the error persists try to make sure there is sufficient memory available.

#### **FOMOG0123**

Could not retrieve the needed request record.

#### **Explanation:**

This is an internal debugger error which indicates that a message queue debugging request record that should exist could not be found.

### **System action:**

Cancel the message queue debugging windows and start over.

## FOMOG0124

Task number is not in pedb 'debug' mode.

#### **Explanation:**

Informational message.

#### **System action:**

No response is necessary.

## FOMOG0125

Task number is not in the current context for view 0.

# Explanation:

Informational message.

#### **System action:**

#### **FOMOG** messages

No response is necessary.

FOMOG0126

MPI has not been initialized for task number.

**Explanation:** 

Informational message.

**System action:** 

No response is necessary.

FOMOG0127

MPI has been finalized for task number.

**Explanation:** 

Informational message.

**System action:** 

No response is necessary.

FOMOG0128 Select a new filter (or filters), then press 'Apply' or 'OK'.

**Explanation:** 

Informational message displayed in the Select Filters window.

**System action:** 

No response is necessary.

FOMOG0129 Select a message to get message details or group information.

**Explanation:** 

Informational message displayed in the task message queue window.

**System action:** 

No response is necessary.

FOMOG0130 Could not get message group information.

**Explanation:** 

An error occurred while attempting to retrieve group information for an MPI message record.

**System action:** 

If the error persists cancel and restart the message queue debugging feature.

FOMOG0131 Could not get message details for task *number*.

**Explanation:** 

An error occurred while attempting to retrieve message detail information for an MPI message record.

**System action:** 

If the error persists cancel and restart the message queue debugging feature.

FOMOG0132 The minimum range value must be greater than the previous lower ranges minimum value.

**Explanation** 

When changing the queue size scale ranges the new minimum value must be greater than the previous ranges minimum value.

System action

Open the Scale Range Setting window and try again.

FOMOG0133 Cannot select more than *number* tags.

**Explanation:** 

The number of tag filters selected is limited.

**System action:** 

Choose fewer then the maximum numbers of tags allowed, as indicated in the message.

824 z/OS: z/OS UNIX System Services Messages and Codes

#### FOMOG2075

"string": <number> - Unable to allocate number of bytes in "string"

### **Explanation:**

Internal error: A memory allocation routine failed because there is not enough memory available. pedb continues processing, but it is likely you will have subsequent problems.

## **System action**

Start pedb again and try the following:

- Debug your program with a subset of the tasks, or with smaller data segments.
- Start your program, and use pedb to attach to a smaller set of tasks that are most interesting to you.
- Contact your System Administrator to increase system resources, if possible.

If you continue to get this error message, gather information about the problem and follow local site procedures for reporting hardware and software problems.

#### FOMOG2204

Could not find event number for *string* when parsing break/trace information.

## **Explanation:**

An internal error occurred when parsing breakpoint or tracepoint information. pedb was unable to find the event number associated with the breakpoint or tracepoint.

### **System action:**

Retry the previous breakpoint or tracepoint action. If you continue to get this error message, gather information about the problem and follow local site procedures for reporting hardware and software problems.

#### FOMOG2205

Only *number* breakpoints allowed per view.

### **Explanation:**

The maximum number of breakpoint per view has been reached.

#### **System action:**

Select another view to define additional breakpoints, or remove some breakpoints that are no longer needed, and then retry setting the breakpoint.

### FOMOG2208

Task *number* has exited.

### **Explanation:**

The task has exited and can no longer be contacted. No further debugging of the program on this task is allowed in this session.

## **System action:**

None. This is an informational message.

#### FOMOG2209

Task *number* has requested exit.

#### **Explanation:**

The indicated task has attempted to exit. The program terminates when all tasks have requested exit.

#### System action:

None. This is an informational message.

## FOMOG2212

The group was not added because the first character in the group name specified was not an alphabetic character.

## **Explanation:**

The new group name specified in the Add Group Window started with a character that was not alphabetic.

#### System action:

Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

## FOMOG2213

The group was not added because the group name contained non-alphanumeric characters.

### **FOMOG** messages

### **Explanation:**

The new group name specified in the Add Group Window was made up of some character(s) that were neither alphabetic nor numeric.

### **System action:**

Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

#### FOMOG2214

The group was not added because the new group name is longer than the maximum group name length of *number*.

### **Explanation:**

The new group name specified in the Add Group Window is longer than the maximum allowed name length.

## **System action:**

Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

#### FOMOG2215

The group was not added because the group name specified was empty.

#### **Explanation:**

When attempting to add a new group, the group name was not specified.

#### **System action:**

Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

#### FOMOG2216

Group string already exists.

#### **Explanation:**

When attempting to add a new group, the name of an existing group was specified.

### **System action:**

Provide a unique group name.

#### FOMOG2217

The maximum number of groups has been reached.

#### **Explanation:**

When attempting to add a new group, the total number of groups exceeded the maximum allowed.

#### **System action:**

Delete unwanted groups to make room for new ones.

## FOMOG2218

There were no free group structures.

#### **Explanation:**

When attempting to add a new group, there were no free group structures.

#### **System action:**

Delete unwanted groups to make room for new ones.

## FOMOG2219

No members were chosen.

## **Explanation:**

When attempting to add a new group, you didn't choose any tasks as its members.

## **System action:**

Select members for the new group.

#### FOMOG2220

Too many members were specified.

#### **Explanation:**

When attempting to add a new group, there were too many members chosen.

#### **System action:**

Select fewer members for the new group.

#### FOMOG2221

Cannot delete group "ALL".

Removing the group "ALL" is not allowed.

## **System action:**

None. This is an informational message.

#### FOMOG2222

A group cannot be deleted if it is the current context in any view.

## **Explanation:**

Removing a group if it is the current context is not allowed.

### **System action:**

Change the context in all views to something other than the group that is to be deleted.

#### FOMOG2223

The attempt to delete group: *string* failed because the group was not found.

#### **Explanation:**

When attempting to remove a group, you specified a group name that does not exist.

### **System action:**

Check for the proper group name and try again.

## FOMOG2224

The partition is not yet loaded.

## **Explanation**

Informational message indicating that your program has not yet been loaded onto the tasks in the partition.

## **System action:**

If you specified the program name on the pedb command line, wait until all of the tasks have been loaded with your program before starting to debug. If you did not specified the program name on the pedb command line, use the Load Executables option from the File pull-down menu to load one or more programs.

#### FOMOG2226

Task *number* has been unhooked.

#### **Explanation:**

The task has been unhooked, and now the program running on that task is no longer under control of the debugger.

### **System action:**

None. This is an informational message.

## FOMOG2227

Source file "string" is newer than the object file being debugged.

### **Explanation:**

pedb detected a source file that appears to be newer than the executable file being debugged. If the file was changed since the executable file was built, the code displayed in the source window will not match the object.

#### **System action:**

If one of the source files has been changed, quit the debugger and recompile. This will insure that movement through the program will be correctly depicted in the source area of pedb. If the modification time of the source file is due to copying or tar'ing the file there should not be any mismatch between the actual position in the program and the displayed in the source area. In this case, updating the modification time of the executable with the touch command will prevent this message from appearing.

#### FOMOG2230

No Items were selected.

#### **Explanation:**

The user selected Apply or OK on the Variable Selection window without choosing any variables to be displayed.

## **System action:**

None. This is an informational message.

#### FOMOG2232

Could not locate source file: string for task: number.

## **Explanation:**

### **FOMOG** messages

pedb could not locate a source file to correspond with the current program state in this task. Consequently no source file for this task will appear in the source file window.

## **System action:**

Check the source file search path and file permissions, pedb processing will continue.

#### FOMOG2234

Unable to open file "string" for task number.

### **Explanation:**

pedb was not able to open the file for reading or determined that the selected file was not a regular file (such as a directory or device).

## **System action:**

This typically occurs when manually selecting a new source file for the source window. In this case, the user should check that the filename is valid and the proper permissions are in effect to allow it to be read. If this message occurs because the debugger stopped in a new source file, one may also want to check the source search path using the Source Path window under File on the menu bar. pedb will display no source if it stops in a file it can not read.

#### FOMOG2235

Source file: *string* on task: *number* is larger than the maximum allowable size, which is 65534 lines.

### **Explanation:**

pedb could not load the entire source file into the buffer used to process the Source File window. If you started pedb in normal mode, both pedb and the program will terminate. If you are using pedb in attach mode, pedb will detach from the program and exit, but the program will not be terminated.

## **System action:**

If you want the ability to debug all the source code for this program, split the code into multiple files, with each file being less than 65535 lines. After completing this, recompile the program.

## FOMOG2236

Unknown source file suffix: string, assuming c.

#### **Explanation:**

The source file had a suffix that was not recognized as a character that represented a language. pedb assumes the source file was written in C. This is the default. Note that some language constructs that are unique to the C language are used on this file.

#### **System action:**

The source file could be renamed if appropriate.

## FOMOG2238

Incorrectly formed member list. No tasks have been added to the group. A member list can contain space or comma separated task numbers, or ranges of task numbers separated by colons or dashes.

## **Explanation:**

The range of task numbers is incorrectly specified.

#### **System action:**

Consult the manual pages for how to create groups in pedb and re-specify the selection.

## FOMOG2240

No executable name was entered.

## **Explanation:**

The "OK" was pressed in the Load Executables window without entering or selecting a program name.

#### **System action:**

Re-open the Load Executables window and enter a program name.

### FOMOG2241

Task number loaded with "string string".

### **Explanation:**

Describes what executable and arguments were loaded for a particular task.

## **System action:**

None. This is an informational message.

#### FOMOG2242

Unable to send command to task 'number'.

An error occurred in sending an pedb command to the indicated task. Probably the remote node is no longer accessible.

### **System action:**

Verify that the remote node in the partition can be contacted by other means. If problem persists, gather information about the problem and follow local site procedures for reporting hardware and software problems.

### FOMOG2243

#### No more new views are available.

### **Explanation:**

During an pedb session there is a limit to how many views can be created. Also, once a view has been closed it cannot be reopened.

## **System action:**

You can use the views that are left to continue debugging.

#### FOMOG2244

### ALL tasks have exited. Quit and restart pedb if you wish to continue.

## **Explanation:**

All the tasks of the partition have exited.

## **System action:**

"Quit" pedb.

### FOMOG2245

### Internal pedb error at line number in file 'string'.string

## **Explanation:**

This is a generic message to mark a situation that should not have occurred.

### **System action:**

Retry the operation or restart pedb. If you continue to get this error message, gather information about the problem and follow local site procedures for reporting hardware and software problems.

#### FOMOG2246

Cannot perform this function in a context unless all the tasks are in DEBUGGED state.

## **Explanation:**

This is a generic message to mark a situation in which a function could not be performed because not all tasks in the context were in DEBUGGED state.

#### **System action:**

Switch to a context where all tasks are in DEBUGGED state.

## FOMOG2250

#### Task number has been sent halt execution.

### **Explanation:**

Halt execution for this task has been selected. This task was running and a request to the remote debugger has been made to stop the task.

#### **System action:**

If the remote debugger is able to regain control over the task, the user should be able to continue debugging this task with pedb.

## FOMOG2257

Tasks: "string" in group: "string" have been sent halt execution.

## **Explanation:**

Halt execution for this group has been selected. For each task in the group that was running, a request to the remote debugger has been made to stop the task.

#### **System action:**

You will be able to continue debugging on the tasks that the remote debugger is able to regain control over.

## FOMOG2259

## Unable to write to the directory string.

### **Explanation:**

pedb was not able to write to the directory specified. This is the directory that is used to write the temporary files used in visualization.

Check the permissions of the directory. pedb uses this directory for temporary files. The default is /tmp. This can be overridden using the MP\_TMPDIR environment variable.

#### FOMOG2260

Unable to parse the stack trace, placing task: *number* in exited state.

#### **Explanation:**

A message was issued indicating that a trace table was unavailable for the function that contains the current program counter.

#### **System action:**

Further debugging of this task will be limited.

#### **FOMOG2261**

Task number is out of range.

### **Explanation:**

A task specified on a Select by Range window is not within the acceptable range of values between 0 and the highest task number in your partition.

#### **System action:**

Retry the range specification using only task numbers between 0 and one less than the value of -procs or MP\_PROCS (since the first task is number 0).

#### FOMOG2262

One or more tasks have not been attached and therefore could not be selected.

#### **Explanation:**

One or more tasks specified on a Select by Range window have not been attached and therefore could not be selected.

#### **System action:**

Make sure the desired tasks have been selected. Adjust selection criteria as necessary.

#### FOMOG2272

A non-integer value has been entered for the array range.

## **Explanation:**

A non-integer value was entered in text field the specifies the minimum/maximum array range.

#### **System action:**

Enter an integer value.

## FOMOG2273

The value entered is less than the minimum range. Enter a minimum value greater than or equal to *number*.

## **Explanation:**

The minimum value range is less than the allowable minimum.

### **System action:**

Enter a minimum value greater than or equal to the minimum index of the array.

### FOMOG2274

Unable to open the file string for exporting.

#### **Explanation:**

pedb was not able to open the file for writing or determined that the selected file was not a regular file (such as a directory or device).

## System action:

Check the permissions or type of the file that was selected. Select a valid filename to allow Exporting.

#### **FOMOG2276**

A non-integer value has been entered for the stride.

#### **Explanation:**

A non-integer value was entered in text field the specifies the stride value.

## **System action:**

Enter an integer value.

#### FOMOG2277

Zero has been entered for the stride. Enter a non-zero integer value.

The stride value must be an non-zero integer.

## **System action:**

Enter an integer value that is non zero.

#### FOMOG2280

A non-integer value has been entered for the minimum range text field.

### **Explanation:**

A non-integer value was entered in text field the specifies the minimum array range.

## **System action:**

Enter an integer value.

#### FOMOG2281

A non-integer value has been entered for the maximum range text field.

## **Explanation:**

A non-integer value was entered in text field the specifies the maximum array range.

## **System action:**

Enter an integer value.

## FOMOG2282

The integer value entered for the minimum text field is outside the allowable range of integers.

#### **Explanation:**

The integer value entered is larger or smaller than the allowable range, which is defined by the largest and smallest integer value.

## **System action:**

Enter an integer within the range of the largest and smallest integer value.

#### FOMOG2283

The integer value entered for the maximum text field is outside the allowable range of integers.

### **Explanation:**

The integer value entered is larger or smaller than the allowable range, which is defined by the largest and smallest integer value.

#### **System action:**

Enter an integer within the range of the largest and smallest integer value.

## FOMOG2284

The integer value entered for the stride text field is outside the allowable range of integers.

### **Explanation:**

The integer value entered is larger or smaller than the allowable range, which is defined by the largest and smallest integer value.

#### **System action:**

Enter an integer within the range of the largest and smallest integer value.

## FOMOG2285

Task number is not in DEBUG state. It is excluded from the export.

## **Explanation:**

A task must be in DEBUG state to be able to participate in an export.

#### **System action:**

If the user does not care that the task was excluded from the multi array export, the message can be ignored. If the user wants the array from the task to be included in the export, the user must put the task in DEBUG state prior to exporting.

## **FOMOG2290**

Could not run the executable for task: number.

## **Explanation:**

The program for the given task encountered a signal when an attempt was made to run it.

## **System action:**

### **FOMOG** messages

This depends on the signal that was encountered, which was given by a previous message. If it was signal 9 there is a good chance that the executable was compiled under an old release and needs to be recompiled.

## **FOMOG2295**

You cannot view the Array Subrange at this time because task: *number* is running.

#### **Explanation:**

A task must be in debug state to be able to view an array subrange. You have issued a command that put the task in a running state after the Array Subrange window for the array was opened.

### **System action:**

To view array subranges using this window you must allow the task to continue until a debug state has been reached. This can be done by waiting for a running task to return, or if it is blocked, by stepping other tasks or pressing the halt button.

#### FOMOG2296

You cannot view the array subrange at this time because the program stack has changed since you created this window. The chosen array is out of scope.

#### **Explanation:**

The array that was chosen in the Array Subrange window is no longer within scope. The program stack has changed due an execution command, such as step or continue. The array chosen may no longer exist due to scoping rules.

### **System action:**

If the array chosen by the Array Subrange window can no longer be reached by stepping program execution back into the function or subroutine, the window is no longer useful and should be cancelled. If the function or subroutine can be reentered by controlling program execution, this window can be used when the scope of the variable is consistent with the program stack.

FOMOG3001 Task number: Unable to find variable

## **Explanation**

The remote debug engine was unable to locate information about the variable.

#### **System action:**

None.

FOMOG3003 Task number: Invalid expression ID

## **Explanation**

Internal error. The remote debug engine was unable to map the given expression id.

#### **System action:**

None.

FOMOG3005 Task number: Unsupported request code

## **Explanation**

Internal error. The remote debug engine was unable to recognize the request code.

# **System action**

Debugging can most likely continue, but will possibly be limited. Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMOG3006 Task number: Expression name is not valid

#### **Explanation:**

The remote debug engine was unable to find the scope in which the expression name resided.

#### **System action:**

None.

#### **FOMOG3008**

Task *number*: Unable to find program to be debugged - check path and name on server

### **Explanation:**

The remote debug engine was unable to find the program to be debugged.

### **System action:**

Verify that the executable is available on all nodes in the partition in the pathname specified or in the executable search path on the node.

#### FOMOG3014

Task *number*: ReplyExpression(): Internal error returned from unknown callee.

#### **Explanation:**

Received an error code from a routine that ReplyExpression() called but there was no additional information to pass on.

### System action:

Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMOG3015

Task: number encountered signal: number - string

## **Explanation:**

The program encountered a signal of the type specified.

## **System action:**

None. This is an informational message.

#### FOMOG3016

Task: number has stopped due to a halt execution request.

## **Explanation:**

This task has been interrupted via a halt execution request. The current program counter is likely at a location where the code has not been compiled with -g, thus portions of the display may be empty. The halt execution function is implemented with signal SIGINT. If the program has a SIGINT signal handler control will return to the SIGINT signal handler when execution is resumed.

#### **System action:**

Selecting entries on the stack may be useful to view local variables in the scopes of the call chain. Execution of this task can be continued via the vcr buttons.

## **FOMOG3017**

Task *number*: No current file name was found, so no local variables are available. The executable may not have been compiled with -g.

## **Explanation:**

While attempting to display local variables for the current or selected function, the owning source file could not be found. Not enough information is available to build a local variable list, pedb continues processing.

#### **System action:**

If this area of the code is of interest, you should recompile the containing object with the -g compiler option, then re-invoke pedb.

#### FOMOG3018

Task *number*: No current function name was found, so no local variables are available. The executable may have been stripped.

## **Explanation:**

While attempting to display local variables for the current function no function name could be found at the current program counter. Not enough information is available to build a local variable list. pedb continues processing.

### **System action:**

If this area of the code is of interest, you should recompile the containing object with the -g compiler option.

## FOMOG3019

Unable to issue the execution request to task: *number*, because it is not in DEBUGGED state.

A request to execute the program has been issued. This task is not in DEBUGGED state so the request will not be honored, pedb continues processing. If the task referenced was part of a group and other tasks in the group did not cause this message, those other tasks will have been processed normally.

## **System action**

None. This is an informational message.

**FOMOG3020** 

process\_dbe\_task\_response(): Internal error: Don't recognize reply code: *string*, for task: *number*.

## **Explanation:**

An unrecognized message was received from the remote debugger.

### **System action:**

Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMOG3021

Play mode has been stopped.

#### **Explanation:**

Play mode has been terminated by the halt or stop button.

#### **System action:**

None. This is an informational message.

FOMOG3022

Play mode has been started.

#### **Explanation:**

Play mode has been initiated by the play button.

### **System action:**

None. This is an informational message.

FOMOG3023

The halt button had no effect on task: *number*, because it was not running.

#### **Explanation:**

The halt button was selected. No action was taken to stop the execution of this task because it was not running.

#### **System action:**

None. This is an informational message.

FOMOG3024

The halt button had no effect on tasks: "string" in group: "string", because they were not running.

## **Explanation:**

The halt button was selected. No action was taken to stop the execution of the tasks listed because they were not running.

#### **System action:**

None. This is an informational message.

FOMOG3025

Task number: Unable to initialize the remote debug engine.

## **Explanation:**

Initialization of the remote debug engine has failed on this task.

### **System action:**

This message may be followed by a FOMOG-0061 message, which will provides additional information regarding the nature of the problem with the remote debug engine. If this information is not sufficient to rectify the problem, gather all relevant details and follow local site procedures for reporting hardware and software problems.

FOMOG3026

Task *number*: Initial break point line number contains non-numeric data.

A line number and filename have been specified for the initial breakpoint via the MP\_DEBUG\_INITIAL\_STOP environmental variable. The format is filename:line\_number. In this case the line number had non numeric characters.

### **System action:**

Re-specify the line number in MP\_DEBUG\_INITIAL\_STOP with only numerics.

#### FOMOG3027

Task number: While attempting to set the initial breakpoint, pedb could not find the file which contains the main routine. Check that the file containing the main routine or the program statement has been compiled with the -g option. The initial breakpoint can be set manually using the MP\_DEBUG\_INITIAL\_STOP environment variable.

#### **Explanation:**

The remote debug engine is attempting to set an initial breakpoint in the main routine. A line number within a source file that correlated with the main routine was not found.

#### **System action:**

Check that the file containing the main routine or the program statement has been compiled with the -g option. The initial breakpoint can be set manually via the MP\_DEBUG\_INITIAL\_STOP environment variable.

FOMOG3028

Task *number*: Remote debug engine was unable to set the initial breakpoint.

#### **Explanation:**

The remote debug engine was unable to set the initial breakpoint.

## **System action:**

Check that the file containing the main routine or the program statement has been compiled with the -g option. Check that the MP\_DEBUG\_INITIAL\_STOP environment variable, if used, is set to an executable line of source code.

**FOMOG3029** 

Task *number*: Function atoi() could not translate line number string to a number.

#### **Explanation:**

The translation of the string following the colon in the MP\_DEBUG\_INITIAL\_STOP environment variable failed.

#### **System action:**

Check that the environment variable MP\_DEBUG\_INITIAL\_STOP has format: filename:line\_number and it is set to an executable line of source code.

FOMOG3030

Task *number*: Internal error: ProcessValueModify(): Call to GetExpressionList() failed.

#### **Explanation:**

Internal error.

#### **System action:**

Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMOG3031

Task *number*: Internal error: ProcessValueModify(): Call to FindTreeNode() failed.

#### **Explanation:**

Internal error.

#### **System action:**

Gather information about the problem and follow local site procedures for reporting hardware and software problems.

FOMOG3032

Task *number*: Unable to process the change value request, check types and ranges.

## **Explanation:**

### **FOMOG** messages

The Change Value window was used but the remote debug engine was unable to change the value of the programs variable.

#### **System action:**

Check that the new value entered is of a type that can normally be assigned to the variable selected. If a range has been used to define the value to be assigned, check that the range is within bounds.

#### FOMOG3033

Task *number*: The tracepoint request failed because the selected source line generates no executable code.

#### **Explanation:**

A source line in the source code window has been selected, and a tracepoint request has been made for that line. The line selected generated no executable code when compiled. No action has been taken.

## **System action:**

Select another source line, then request the tracepoint again.

FOMOG3034

Task *number*: The breakpoint request failed because the selected source line generates no executable code.

#### **Explanation:**

A source line in the source code window has been selected, and a breakpoint request has been made for that line. The line selected generated no executable code when compiled. No action has been taken.

#### **System action:**

Select another source line then, request the breakpoint again.

**FOMOG3035** 

Task *number*: The breakpoint request failed. An invalid source line or invalid condition was specified.

## **Explanation:**

A source line in the source code window has been selected, and a breakpoint request has been made for that line. The line selected may not have generated any executable code when compiled. If a condition was specified, it may have been invalid. No action has been taken.

## **System action:**

Select another source line or specify a different condition.

FOMOG3036

Task *number*: The tracepoint request failed. An invalid source line or invalid condition was specified.

#### **Explanation:**

A source line in the source code window has been selected, and a tracepoint request has been made for that line. The line selected may not have generated any executable code when compiled. If a condition was specified, it may have been invalid. No action has been taken.

### **System action:**

Select another source line or specify a different condition.

**FOMOG3037** 

Task *number*: Internal error: An unsupported breakpoint action has been requested in ReplyBreakpointLocation().

### **Explanation:**

Internal error.

## System action:

Gather information about the problem and follow local site procedures for reporting hardware and software problems.

**FOMOG3038** 

Task number: Maximum array range specified is out of bounds.

#### **Explanation:**

The user specified a maximum array range that was out of bounds. Alternatively, it is possible that the array was not allocated due to the optimizations by the compiler.

## **System action:**

Check the permissible ranges and reset the range values.

#### FOMOG3040

Task *number*: The executable name chosen for debugging resolved to a full pathname where the length of the path prefix exceeds the PATH\_MAX flag value or a pathname is longer than the NAME\_MAX flag value while the POSIX\_NO\_TRUNC flag is in effect.

#### **Explanation:**

The remote debugger could not find the program to execute on a task.

## **System action:**

Check the path for the program on the remote node.

#### FOMOG3041

Task *number*: The executable name chosen for debugging was not found.

### **Explanation:**

The remote debugger attempted to find the program to execute on a task.

### **System action:**

Check that the executable file for the program is available on the remote node.

#### FOMOG3042

Task *number*: The executable name chosen for debugging was not a regular file.

## **Explanation:**

The remote debugger attempted to find the program to execute on a task. The program name specified was not a regular file. It may have been a directory, socket, device or some other special file.

### **System action:**

Check that the executable file for the program is available on the remote node.

#### FOMOG3043

Task *number*: The executable chosen for debugging did not have execute permission.

### **Explanation:**

The remote debugger attempted to find the program to execute on a task.

#### **System action:**

Update the permissions on the program file on the remote node.

## FOMOG3044

Task *number*: The executable chosen for debugging is not an S/390° executable.

#### **Explanation:**

The remote debugger could not find the program to execute on a task.

### **System action:**

Check that the program file on the remote node is an S/390 executable.

## FOMOG3045

Task *number*: The executable chosen for debugging did not have read permission.

#### **Explanation:**

The remote debugger could not find the program to execute on a task.

#### **System action:**

Update the permissions on the program file on the remote node.

#### FOMOG3046

Task *number*: The executable chosen for debugging did not have execute or read permission.

#### **Explanation:**

The remote debugger could not find the program to execute on a task.

#### **System action:**

Update the permissions on the program file on the remote node.

## FOMOG3049

All tasks have exited. Select OK to exit, then restart pedb if you wish to continue debugging.

#### **FOMOH** messages

#### **Explanation:**

All the tasks in the partition have exited. There is currently no program restart facility in pedb.

## **System action:**

Selecting OK will exit pedb. Issue the pedb command again to do further debugging.

#### FOMOG3050

The remote debug engine for task: number has failed with: string.

### **Explanation:**

There is a remote debug engine started for each of the instances of the POE program. One of the remote debug engines has failed. The entire debug session has been terminated.

#### **System action:**

Restart pedb. If the problem persists set the MP\_DEBUG\_LOG environment flag to 3 and have the log (/tmp/debug\_log.pid.task\_number) available when reporting the problem.

#### **FOMOG9999**

pedb exiting.

### **Explanation:**

pedb is terminating due to error as opposed to a deliberate action. Generally this message is preceded by a specific message which gives the reason why pedb quit prematurely.

## **System action:**

Refer to the message that precedes this error message.

## **FOMOH**

# FOMOH0101

Your program has been loaded.

### **Explanation:**

This message is issued when your program has been loaded into the tasks in the partition. This message indicates all the functions available in pdbx are available for you to use.

### **System action:**

When this message is displayed, you can start debugging the tasks in the partition.

## **FOMOH0104**

The remote debugger on task: *number* has exited with the following error: *string* 

#### **Explanation:**

The debugger on the remote node has exited prematurely and pedb will exit.

## **System action:**

The error message from the remote debugger is presented. Use the information provided by the remote debugger message to proceed.

#### **FOMOH0105**

Error creating temporary file 'string'.

## **Explanation:**

When starting pdbx in attach mode, a temporary file is created, consisting of a list of tasks that are executing under the poe job that you specified. The contents of this file are displayed in the menu from which you select the tasks that you wish to attach. This temporary file is created in /tmp by default, unless you specify a different directory with the TMPDIR environment variable. The naming convention for this file is: </tmpdir>/.pdbx.<poe-pid>.menu where </tmpdir> is either /tmp, or the directory specified by the TMPDIR environment variable, if it has been defined, and where <poe-pid> is the process ID of the poe job to be attached to. The message that you received appears when the temporary attach task menu file cannot be opened, or when errors are detected while writing to the file.

### **System action:**

Verify that there is enough space available in the /tmp filesystem, or if you have specified a directory with the TMPDIR environment variable, check the filesystem that contains this directory for sufficient space. You may also want to check to be sure that a file of the same name does not already exist.

### FOMOH1001

Missing command file name following the -c flag. For information on the correct syntax to use when invoking pdbx, type: pdbx -h

The -c flag requires the name of a file as an argument. This argument was missing. It is also required that the file have read permissions set for the pdbx user.

### **System action:**

Specify the name of a pdbx "command" file following the -c flag. A pdbx "command" file is a file containing valid pdbx commands.

#### FOMOH1002

Missing or invalid argument following the -I flag. For information on the correct syntax to use when invoking pdbx, type: pdbx -h

### **Explanation:**

The -I flag requires the name of a directory that pdbx will search for source code files on the remote tasks. This argument was missing or invalid.

### **System action:**

Specify the name of a directory following the -I flag. This directory should be available to each task in your partition because the -I flag will be passed to each remote dbx debugger.

#### **FOMOH1003**

Missing or invalid argument following the -d flag. For information on the correct syntax to use when invoking pdbx, type: pdbx -h

## **Explanation:**

The -d flag requires an integer argument that specifies the nesting depth limit of program blocks.

#### **System action:**

Specify an integer. Note that this overrides the default nesting depth limit of 25 program blocks.

#### **FOMOH1004**

Usage: pdbx [-h] [program [program arguments]] [-c command\_file] [-d nesting\_depth] [-I directory [-I directory]...] [-F] [-x] [poe options]

### **Explanation:**

The pdbx command line has a syntax error.

## **System action:**

Make sure that the syntax on the command line is correct. Correct the specific problem identified by the preceding message.

### **FOMOH1005**

Unable to read command file specified by the -c flag.

#### **Explanation:**

You must specify a command file that you have read access to after the -c flag. The file that you specified after the -c flag did not have read permission so that pdbx could open it for reading.

#### **System action:**

Check the name of the file and the permissions to ensure that it is readable.

## **FOMOH1006**

You must use the "attach", the "quit" or the "help" command.

#### **Explanation:**

When starting the debugger in attach mode, at the initial prompt the only allowable commands are attach, quit, or help.

## **System action:**

Enter a valid command to continue.

## **FOMOH1009**

Could not create remote pdbx\_startup file: "string".

#### **Explanation:**

For each task to be initialized, the remote dbx requires the creation of a temporary startup file. pdbx requested that the partition manager daemon create the file and the partition manager daemon was unable to do so.

### **System action:**

The temporary pdbx\_startup file is to be created in the directory specified by the MP\_TMPDIR environment variable, the -tmpdir flag, or /tmp. Make sure that this directory is available for writing by you on each node allocated to your partition.

#### **FOMOH1010**

Could not read message from poe.

pdbx was unable to read data from the POE debug socket.

### **System action:**

Debugging can continue except that the information bout synchronized exit may not be passed back to the debugger from the POE job. Please note that the debugger will most likely not be able to re-attach to this POE job after detaching.

### **FOMOH1012**

Cannot switch to context "string", which has RUNNING task(s), until all tasks in the partition have been loaded with a program.

### **Explanation:**

Some of the tasks have been loaded with a program and some have not. The tasks that have been loaded are RUNNING and waiting to synchronize with all of the other tasks in the partition. This wait is normal processing that happens at the start of a parallel program to pass ip addresses around in preparation for future message passing calls.

## **System action:**

Continue to load programs on the remaining tasks in the partition. At this time you can only switch context to groups and tasks that have all task(s) in DEBUG\_READY state.

## FOMOH2001

Could not delete the groups events (breakpoints or tracepoints) from task: number, because this task is RUNNING.

#### **Explanation:**

Since the task was not in DEBUG\_READY state, pdbx could not delete its events (breakpoints or tracepoints). It is possible to continue but there are some events (breakpoints or tracepoints) that pdbx no longer has a record of.

### **System action:**

Issue the group list or tasks command to view the state of the tasks. The tasks in the group that are in RUNNING state are the ones on which pdbx could not delete the events.

### FOMOH2002

Could not add the groups events (breakpoints or tracepoints) to task: *number*, because this task is RUNNING.

#### **Explanation:**

Since the task was RUNNING and not available for debug commands, pdbx could not add the group events (breakpoints or tracepoints) for this task. It is possible to continue but the group breakpoints will not have been set for this task.

### **System action:**

Issue the group list or tasks command to check the state of the tasks. Create a new group after all of the tasks of interest have stopped RUNNING and are under debugger control.

#### **FOMOH2003**

Breakpoint or tracepoint: "string" could not be set by pdbx on task: number.

#### **Explanation:**

The remote dbx was unable to set a breakpoint or tracepoint.

### **System action:**

Make sure the requested breakpoint or tracepoint was valid. Use the status command to see what pdbx events have been set. Issue the pdbx where command to find out where the program is on each node.

## FOMOH2004

"string" is ambiguous on one or more of the tasks in the current context. Also, the response from "whatis string" varies from task to task. The following grouping of tasks would give each group the ability to resolve the symbol consistently

### **Explanation:**

If a symbol, typically a function, is found to be ambiguous, pdbx issues a menu to the user that allows him to select the instance(s) to which the command (such as stop in, list, or func) is applied. To simplify the user interface, the parallel debugger requires that all tasks in the partition have a consistent view of the ambiguous symbol, since pdbx can display only one selection menu for a context.

Issue the whatis command to make sure the symbol in question is resolved in the current context. This message is also followed by a table that suggests a set of groups, each of which would resolve the symbol in the same way. Using these or similar groups, you could issue the same command by changing the context as desired.

#### **FOMOH2005**

The network connection from pdbx or pedb to task: number failed.

### **Explanation:**

An error was encountered when pdbx or pedb attempted to read or write using a socket connection to the task. pdbx or pedb will no longer have any control over this task.

### **System action:**

The debugger can continue after a task loses contact with the home node. Under certain circumstances, you might choose to continue debugging using the remaining tasks for some period of time.

## **FOMOH2013**

Debugger attached and ready.

## **Explanation**

All of the specified tasks have been attached, and you are able to start debugging.

## **System action**

None. This is an informational message.

**FOMOH2014** 

Internal Error: non-zero status: number returned from pm\_respond().

## **Explanation**

Internal Error: The main communication control section of the home node portion of pdbx has indicated a failure.

# System action

Restart pdbx, verify that your job runs correctly under poe and that poe is correctly installed and configured for your id. If the problem persists, gather information about it and follow local site procedures for reporting hardware and software problems.

## **FOMOH2015**

Could not open socket for debugger to communicate with poe.

## **Explanation**

The socket() call failed when the debugger tried to set up communications with POE.

## **System action**

Debugging can continue except that the information about synchronized exit will not be passed back to the debugger from the POE job. Please note that the debugger will most likely not be able to re-attach to this POE job after detaching.

## FOMOH2016

Could not make socket connection to poe.

## **Explanation**

The connect() call failed when the debugger tried to set up communications with POE. The information about a synchronized exit is not passed back to the debugger from the POE job. The debugger probably cannot re-attach to this POE job after detaching.

You can continue debugging with limited function. Please note that the debugger probably cannot re-attach to this POE job after detaching.

**FOMOH2017** 

Missing or invalid argument to -a flag. For information on the correct syntax to use when invoking pdbx, type: pdbx -h

## **Explanation**

The -a flag requires an integer argument specifying the process identifier of the POE process.

## **System action**

Specify the POE process id when using the -a flag. For example, specify pdbx -a 34192.

**FOMOH2018** 

Program not loaded. Issue 'load' or other context-insensitive command.

## **Explanation**

Your program must be loaded on the partition before the pdbx command is executed.

## **System action**

Load your program into the partition.

**FOMOH2019** 

Cannot specify a context for a context-insensitive command.

## **Explanation**

The command that was entered defines a context-insensitive action for a context-sensitive command. Context insensitive commands cannot be issued in conjunction with context-sensitive commands.

## System action

Re-specify your command string without the context-sensitive prefix.

FOMOH2020

Either the alias name which has a 15 character maximum or the alias string which has a 79 character maximum is too long.

## **Explanation**

You have defined an alias that is longer than 15 characters or an alias string that is longer than 79 characters.

## **System action**

Re-specify your alias definition within the allowable maximum limits.

**FOMOH2021** 

Internal error in "string": number - pdbx was unable to resolve the current context into task numbers.

## **Explanation**

The context-sensitive command that you entered has no current context defined.

## **System action**

Select a different context, or create a new group then re-enter the command. If the problem persists, gather information about it and follow local site procedures for reporting hardware and software problems.

FOMOH2022

Task: number has already been loaded with a program.

The task number that you specified has already been loaded.

## **System action**

Specify another task that has not been loaded. Issue the group list or tasks command to check the state of the tasks. The tasks in NOT LOADED state are the ones that still need to be loaded with a program.

#### **FOMOH2024**

You specified a breakpoint or tracepoint event number on the pdbx delete command that does not exist within the current context.

## **Explanation**

The event that you specified does not exist within the current context.

## System action

Check the event number within your current context. Find event numbers using the status or status all command.

#### **FOMOH2025**

No events were deleted, because of incorrect syntax. The correct syntax is 'delete' followed by an event list where the event list can contain space or comma-separated event numbers, or range(s) of event numbers separated by colons or dashes. 'delete \*' will delete every event within the context, while 'delete all' will delete every event in every context.

## **Explanation**

Invalid syntax for the pdbx delete command.

## System action

Specify the delete command followed by a space or comma-separated list of event numbers. Specify ranges of events using a dash or a colon. The command delete \* will delete all events within the context, while delete all will delete all events in all contexts. Find event numbers using the status or status all command. Consult the man pages for further information regarding the pdbx delete command. Re-issue the command using the correct syntax.

#### FOMOH2026

EOF detected (and ignored) on STDIN. To exit, use 'quit'.

## **Explanation**

Unexpected EOF (user pressed ID) from STDIN.

### **System action:**

pdbx does not recognize an EOF generated from the keyboard as a request to exit the debugger because it can be inadvertently typed as <Crtl>-d. To exit the debugger, use the quit command.

## **FOMOH2027**

The task or group cannot execute remote debugger commands.

### **Explanation:**

The task or group that is the current context has no tasks in DEBUG READY state.

## **System action:**

Issue the group list or tasks command to determine the states of the tasks. Use the halt command to bring RUNNING tasks under debugger control.

### **FOMOH2028**

Task number may not have detached properly.

The write to the task socket did not succeed.

## **System action**

None.

F0M0H2029

No remote dbx is available to issue the dhelp command.

## **Explanation**

All the tasks are RUNNING and cannot handle the dbx command. The dhelp command needs at least one task to be under debugger control.

# **System action**

Issue the halt command to bring the RUNNING task(s) under debugger control or issue hook to an unhooked task and re-issue dhelp.

#### **FOMOH2030**

The correct syntax is: 'group add group\_name member\_list'. A member list can contain space or comma-separated task numbers, or ranges of task numbers separated by colons or dashes. Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

## **Explanation**

Invalid syntax for the pdbx group add command.

# **System action**

Consult the man pages for the pdbx group command and re-specify the command. Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

## FOMOH2031

No tasks were added to any group because you specified an incorrectly formed member list. A member list can contain space or commaseparated task numbers, or ranges of task numbers separated by colons or dashes.

## **Explanation**

The group member list is incorrectly specified.

## **System action**

Consult the man pages for the pdbx group command and re-issue the command again.

#### **FOMOH2032**

No action was taken because the group name is longer than the maximum group name length of *number*.

## **Explanation**

The group name specified is too long to be processed.

## System action

Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

#### **FOMOH2033**

No action was taken because the first character in the group name specified was not an alphabetic character.

## **Explanation**

The group name specified started with some character that was not alphabetic.

## **System action**

Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

**FOMOH2034** 

Cannot create any more groups because the maximum number already exists.

## **Explanation**

You issued the group add command but there are already as many groups defined as can exist.

## **System action**

You need to reduce the current number of groups in order to open up a slot for another group to be created.

**FOMOH2035** 

No action was taken on group "string", because it is the group reserved to contain all of the tasks.

## **Explanation**

You issued the group add command in an attempt to add tasks to the group reserved to contain all of the tasks. No action could be taken because this group already contains all of the tasks.

## **System action**

Specify a different group name on the group add command.

**FOMOH2036** 

Task: *number* has experienced an error in communicating with pdbx. It cannot be added to a group.

## **Explanation**

The specified task is not communicating properly with the home node, so it is marked as unavailable for any command that attempts communications.

## **System action**

The debugger can continue after a task loses contact with the home node. Under certain circumstances, you might choose to continue debugging using the remaining tasks for some period of time.

**FOMOH2037** 

Cannot add task: number, because it is already in group "string".

## **Explanation**

The task specified on the group add command is already included in the group specified.

# **System action**

Retry the command specifying only task(s) that are not already included within the specified group.

**FOMOH2038** 

No action has been taken because a task number is out of range.

### **FOMOH** messages

## **Explanation**

The task specified on the group or on command is not an acceptable value.

## **System action**

Retry the range specification using only task numbers between 0 and one less than the value of -procs or MP\_PROCS (since the first task is number 0).

**FOMOH2039** 

One task was added to group "string".

## **Explanation**

A task was added to the specified group.

## **System action**

None. This is an informational message.

**FOMOH2040** 

number tasks were added to group "string".

## **Explanation**

The list of tasks was added to the specified group.

# **System action**

None. This is an informational message.

**FOMOH2041** 

The correct syntax is: 'group change old\_name new\_name'.

## **Explanation**

The group change command was improperly formed.

## **System action**

Re-issue the command specifying the existing group name and the new group name.

FOMOH2042

No action was taken because the group name "string" was not found.

## **Explanation**

The group name you specified to be renamed on the group change command could not be found by pdbx.

## System action

Use the group list command to see the list of groups currently defined. Make sure that the group you wish to rename already exists.

**FOMOH2043** 

No action was taken because the group name "string" is already used.

## **Explanation**

The new name, for the group to be renamed, on the group change command already exists. The existing group will not be renamed to avoid confusion or ambiguity.

Use the group list command to see the list of groups currently defined. Make sure that the group name you wish to change the existing group to does not already exist.

### FOMOH2044

No action was taken because the new group name is longer than the maximum group name length of *number*.

## **Explanation**

The new group name specified on the group change command is too long to be handled.

## **System action**

Choose a string under 32 characters for the new group name and retry the command.

## **FOMOH2045**

Group "string" has been renamed to "string".

## **Explanation**

You have given a new group name to a previously existing group.

## **System action**

Note that the old group name no longer exists.

#### **FOMOH2046**

The correct syntax is: 'group delete group\_name [member\_list]'. A member list can contain space or comma-separated task numbers, or ranges of task numbers separated by colons or dashes. Specify the group name as a string of characters.

## **Explanation**

The group delete command requires an existing group name as an argument.

## **System action**

Re-issue the command with an existing group name as an argument. If you wish to delete one or more tasks from a group, specify the list of tasks to be deleted after the group name.

#### **FOMOH2047**

Nothing was deleted because the group name "string" was not found.

## **Explanation**

The group delete command requires an existing group name as an argument. The specified group could not be matched with any of the existing groups.

## System action

Use the group list command to see the list of groups currently defined. Make sure that the group you wish to delete or modify already exists.

## **FOMOH2048**

No action was taken on group "string", because it is the group reserved to contain all of the tasks.

## **Explanation**

The debugger requires at least one group which represents all the tasks in your partition. This group cannot be deleted or modified.

You can create a group with all tasks except one or two in two steps:

- 1. Create a group with all tasks using group add *new\_group* 0-num\_procs where num\_procs is the number of tasks in your partition.
- 2. Use group delete new\_group member\_list to remove one or more tasks from the new group.

#### **FOMOH2049**

Incorrectly formed member list. No tasks were deleted from any group. A member list can contain space or comma-separated task numbers, or ranges of task numbers separated by colons or dashes.

## **Explanation**

You specified a member list with the group delete command, but the member list was not recognized, so no action was taken.

## System action

Re-issue the group delete command with a valid member list.

**FOMOH2050** 

Task: number was successfully deleted from group "string".

## **Explanation**

A task has successfully been deleted from a group.

## **System action**

None. This is an informational message.

**FOMOH2051** 

The group "string" was not found.

## **Explanation**

The group you specified on the group list command is not known to pdbx.

## **System action**

Re-issue the group list command with a valid group name or issue group list to list all groups.

**FOMOH2052** 

Internal error in "string": number - No action was taken because the group has no members.

## **Explanation**

You issued the group list on an empty group.

## **System action**

This is an internal error, retry the command. If the problem persists, gather information about it and follow local site procedures for reporting hardware and software problems.

**FOMOH2053** 

Valid group actions are: add, change, delete and list.

## **Explanation**

You issued a group command with invalid syntax.

Check syntax and re-issue the group command.

#### **FOMOH2054**

The correct syntax is: 'hook' (with no arguments).

## **Explanation**

You issued the hook command with one or more arguments. hook takes effect on the current command context or the temporary command context when used in combination with the on command.

## System action

Re-issue the hook command with no arguments.

### **FOMOH2055**

No action has been taken because the task or group is not unhooked, or has completed and is in exited state.

## **Explanation**

There are no unhooked tasks in the command context that you specified. When a task that has been unhooked completes, it changes from unhooked state to exited state. Once an unhooked task completes, it can no longer be hooked.

## **System action**

Use the group list or tasks command to view the state of the tasks.

#### **FOMOH2056**

Task: number has already exited.

## **Explanation**

You attempted to hook this task but the task had already completed processing and exited.

## System action

None. This is an informational message.

## **FOMOH2057**

No action was taken on group "string", because it is a group name reserved for use by the debugger.

## **Explanation**

The group add or group change command was issued with a group name that the debugger uses.

## System action

Specify a different group name on the group add or group change command.

#### **FOMOH2058**

The correct syntax is 'on context' or 'on context command', where command is the command you wish to execute on the specified context.

## **Explanation**

An on command has been issued with incorrect syntax.

# **System action**

Check syntax and re-issue the on command.

#### **FOMOH2059**

Group "string" not found. No action performed.

## **Explanation**

You issued the on command with a group specified, but the group is not known to pdbx.

## **System action**

Issue group list to display group names, then re-issue on command.

**FOMOH2060** 

The correct syntax is: 'source filename'.

## **Explanation**

The source command cannot be issued with zero or greater than one arguments.

## **System action**

Re-issue the source command with only one argument.

**FOMOH2061** 

Cannot open the command file that was specified on the source command.

## **Explanation**

The source command has been issued with a filename that either does not exist or has no read permission.

## **System action**

Make sure the file exists and has read permission.

FOMOH2062

The correct syntax is either 'status' or 'status all'.

## **Explanation**

An argument other than all was specified on the status command.

# **System action**

Re-issue status with no arguments or with all as the single argument.

**FOMOH2063** 

All events (breakpoints or tracepoints) are in use for this task or group.

## **Explanation**

The maximum number of events for this task or group has been exceeded. Each breakpoint or tracepoint that is set causes an event to be recorded.

## System action

Use the delete command on any event(s) in this task or group to reduce the number of events, then re-issue the original command.

**FOMOH2064** 

The task has experienced an error in communicating with pdbx.

## **Explanation**

Events cannot be added to this task because there is a communication problem with this task.

The debugger can continue after a task loses contact with the home node. Under certain circumstances, you might choose to continue debugging using the remaining tasks for some period of time.

**FOMOH2065** 

You specified an invalid breakpoint or tracepoint. The command failed on task *number - string*.

## **Explanation**

The breakpoint or tracepoint that you tried to create using the pdbx stop or trace command was not accepted by the remote dbx debugger.

## **System action**

Check the pdbx stop or trace command syntax.

**FOMOH2066** 

The correct syntax is: 'unhook' (without any arguments).

# **Explanation**

You issued the unhook command with one or more arguments. The unhook does not take any arguments. unhook takes effect on the current command context or the temporary command context when used in combination with the on command.

## **System action**

Re-issue the unhook command with no arguments.

**FOMOH2067** 

The correct syntax is: 'unalias alias\_name'.

# **Explanation**

You specified zero or greater than one arguments with the unalias command.

# **System action**

Check the pdbx syntax for unalias and re-issue the command.

**FOMOH2068** 

"string" is not aliased.

## **Explanation**

You attempted to unalias an unknown alias.

## **System action**

To display the existing aliases, issue the alias command with no arguments. Issue the unalias command with one of the existing aliases to remove it.

**FOMOH2069** 

Reading command file "string".

# **Explanation**

The debugger has started reading the command file specified by the -c command line flag, the source command or as a result of having a .pdbxinit file in the current working directory or your home directory.

# **System action**

None. This is an informational message.

#### **FOMOH2070**

command file line number: "string"

# **Explanation**

The debugger displays each line of the command file as it is read showing the line number and the text.

# **System action**

In the event one or more lines in the command file cause errors in the debugger, this message will show the line number and the text that needs to be corrected. Unless a severe error is encountered causing the debugger to terminate, a command file will generally be read in its entirety even if it contains multiple errors.

#### **FOMOH2071**

No tasks were attached due to a badly formed task list.

# **Explanation**

Invalid syntax for the attach command.

# **System action**

Specify the attach command followed by a space or comma-separated list of task numbers. Specify ranges of tasks using a dash or a colon. The command attach all may be used to attach to all the tasks of the poe application.

### FOMOH2072

Cannot send commands to task: number because it is executing.

## **Explanation**

It is not possible to send a **dbx** command to a task that is RUNNING.

# **System action**

Issue the group list or tasks command to make sure the tasks are not RUNNING.

#### **FOMOH2073**

Error creating temporary file 'string'.

# **Explanation**

When starting pdbx in attach mode, a temporary host.list file is created, consisting of only the tasks that you selected to attach to. This temporary host.list file is created in /tmp by default, unless you specify a different directory with the TMPDIR environment variable. The naming convention for this file is: 

tmpdir>/.pdbx.<poe-pid>.host.list where </tmpdir> is either /tmp, or the directory specified by the TMPDIR environment variable, if it has been defined, and where <poe-pid> is the process ID of the poe job to be attached to. The message that you received appears when the temporary host.list file cannot be opened, or when errors are detected while writing to the file.

# **System action**

Verify that there is enough space available in the /tmp filesystem, or if you have specified a directory with the TMPDIR environment variable, check the filesystem that contains this directory for sufficient space. You may also want to check to be sure that a file of the same name does not already exist.

**FOMOH2075** 

"string": number - Unable to allocate number of bytes in "string".

# **Explanation**

Internal error: A memory allocation routine failed because there is not enough memory available. pdbx continues processing, but it is likely you will have subsequent problems.

Start pdbx again and try the following:

- Debug your program with a subset of the tasks, or with smaller data segments.
- Contact your System Administrator to increase system resources, if possible.

If you continue to get this error message, gather information about the problem and follow local site procedures for reporting hardware and software problems.

#### **FOMOH2076**

There are no tasks in DEBUG READY state (active).

## **Explanation**

The response to the active command is that there are no tasks that are ready to be debugged. This is to say that there are no tasks that are active with respect to the debugger.

## **System action**

None. This is an informational message.

#### **FOMOH2077**

Command "string" is not valid when using pdbx.

#### **Explanation:**

pdbx does not allow the use of this command.

### **System action:**

Check z/OS UNIX System Services Parallel Environment: Operation and Use for a description of commands that are not allowed.

### **FOMOH2079**

pdbx help screen

#### **Explanation:**

This is the pdbx help screen.

#### **System action:**

None.

#### **FOMOH2080**

Could not set breakpoint or tracepoint event.

#### **Explanation:**

A stop or trace event could not be added in the current context.

# **System action**

Check z/OS UNIX System Services Parallel Environment: Operations and Use for information about setting breakpoints and tracepoints.

## **FOMOH2081**

Cannot set breakpoint or tracepoint event in different source files.

## **Explanation:**

pdbx will not attempt to set a breakpoint at a line number when in a group context if the group members (tasks) have different current source files.

#### **System action:**

Either choose to set events for individual tasks or set the same source file for the whole group.

## FOMOH2082

Could not find a task available for debugger commands in the current context.

## **Explanation**

No tasks in DEBUG READY state were found in the current context. This action requires that a dbx command be issued to the remote node, and that the node is not RUNNING. If the task is RUNNING, it is not ready for debugger commands.

Issue the group list or tasks to make sure that one or more tasks are ready to be debugged.

**FOMOH2083** 

The correct syntax is: syntax listed

## **Explanation**

You issued the stop command with the incorrect syntax.

# **System action**

Re-issue the command using the correct syntax.

**FOMOH2084** 

Missing argument to the -dbxpromptmod flag. For information on the correct syntax to use when invoking pdbx, type: pdbx -h

# **Explanation**

The -dbxpromptmod flag requires a text string as an argument. This text string was missing.

## **System action**

Specify a text string to be used to modify the dbx prompt so that it will not collide with your data or program.

**FOMOH2085** 

The dbx prompt modifier is too long; the maximum length is *number*. For information on the correct syntax to use when invoking pdbx, type: pdbx -h

# **Explanation**

The dbx prompt modifier string that you specified using the command line -dbxpromptmod flag or the MP\_DBXPROMPTMOD environment variable was too long.

# **System action**

Reset the MP\_DBXPROMPTMOD environment variable or retry the pdbx command with a shorter string following the -dbxpromptmod flag.

**FOMOH2086** 

Event: "number" cannot be deleted because it does not exist in the specified or current context.

## **Explanation**

You issued the delete command with an event number that does not exist in the command context.

## **System action**

Use the status or status all command to display the events that are associated with the command context. Re-issue the delete command with a valid event.

**FOMOH2087** 

Task *number* was not deleted, because it is not a member of group "string".

## **Explanation**

You issued a group delete group\_name member\_list command, but one of the tasks in the member\_list was not in the group specified.

To display members of a group issue group list group\_name.

#### **FOMOH2090**

Cannot reestablish events that were generated from a pdbx "select" menu.

# **Explanation**

You issued a group add command to an existing group or a hook command and one or more events in the group or task resulted from a pdbx "select" menu. These events cannot be recreated automatically by pdbx.

# **System action**

You can manually recreate the events using the list in the message that follows this one.

#### **FOMOH2091**

The correct syntax is either 'halt' or 'halt all'.

# **Explanation**

You issued the halt command with an incorrect argument. halt takes effect on the current command context or the temporary command context when used in combination with the on command. The halt command attempts to get RUNNING or hung programs under debugger control. This is done by sending interrupts to all tasks that are RUNNING in the current context. When halt all is specified, interrupts are sent to all RUNNING tasks, regardless of context.

# **System action**

Re-issue the halt command with no arguments or with all.

### FOMOH2100

Specify a decimal number from 1 through *number*, or <Ctrl-c> to exit menu.

## **Explanation**

Syntax that was supplied in response to the select menu is not recognized.

## **System action**

A command has been issued where the symbol cannot be resolved. Reply to this menu with the correct syntax to further qualify which symbol is to be selected.

#### **FOMOH2101**

Specify a list of space or comma-separated numbers and ranges or an asterisk. A number is a decimal number from 1 through *number*. A range is a dash ('-') separated pair of numbers. An asterisk will select all choices in the menu. A <Ctrl-c> will exit the menu.

## **Explanation**

The syntax that was supplied in response to the select menu was not recognized.

## **System action**

A command has been issued where the symbol cannot be resolved. Reply to this menu with the correct syntax to further qualify which symbol is to be selected.

FOMOH2102

The sh command with no arguments is not allowed.

## **Explanation**

You issued the sh command with no arguments, which is not allowed.

# System action

Issue the sh command with a specific executable name supplied. For example: sh 1s.

#### **FOMOH2103**

The requested command could not be executed on the specified context because at least one task in that context is currently RUNNING.

# **Explanation**

You can only issue the on context command form of the on command when there are no tasks RUNNING in the specified context.

## **System action**

Use the command group list context or tasks to check the tasks' states. To get all of the tasks in another context under debugger control, issue on context, then <Ctrl-c>, then halt.

FOMOH2104

The following command: "string" is unrecognized at the pdbx-subset prompt.

# **Explanation**

You issued a command from the pdbx-subset prompt that is not understood.

# **System action**

Issue the help command at the pdbx-subset prompt for short descriptions or use man pdbx to find out which commands are available at the pdbx-subset prompt.

#### **FOMOH2105**

The current context contains at least one RUNNING task. When these RUNNING task(s) reach a breakpoint or complete execution, a pdbx prompt is displayed.

## **Explanation**

You issued the back or halt command from the pdbx-subset prompt. Some of the tasks in the current context are RUNNING. A pdbx prompt will appear when the RUNNING task(s) reach a breakpoint or complete execution.

# **System action**

Either wait for the pdbx prompt or issue a <Ctrl-c> to get a pdbx-subset prompt. You can then issue the tasks or group list command to view the state of the tasks. The on command is available at the pdbx-subset prompt if the user wants to then switch to a different context.

#### **FOMOH2106**

Switching to context: "string", where there is at least one RUNNING task. When these RUNNING task(s) reach a breakpoint or complete execution, a pdbx prompt is displayed.

# **Explanation**

You issued the command on context. The target context has some task(s) that are RUNNING. This is an informational message to let you know that a pdbx prompt will not be displayed immediately.

If you want to switch to a context where all tasks are ready to be debugged, press <Ctrl-c> to obtain a pdbx-subset prompt. You can list the state of tasks using the tasks or group list command. The on command is available at the pdbx-subset prompt if you want to then switch to a different context.

**FOMOH2107** 

Could not attach to task number.

## **Explanation**

An error occurred while attempting to attach to the task.

# **System action**

Check the poe application and restart the debugger.

**FOMOH2108** 

The following RUNNING task(s): "string" have been interrupted.

## **Explanation**

The task(s) listed were in RUNNING state. The halt command attempted to interrupt them so that a pdbx prompt will be issued for the current context.

## System action

After the pdbx prompt is issued, further debugger commands can be issued.

**FOMOH2109** 

No action taken on task(s): "string", because they have either been stopped by the debugger, finished executing, or have been unhooked.

# **Explanation**

The tasks listed were not RUNNING. These tasks may already be under the control of the debugger because of a breakpoint or step command. They could also have finished execution or be unhooked.

# **System action**

None. This is an informational message.

**FOMOH2110** 

No action has been taken because you specified a task number that was not attached to.

# **Explanation**

A task specified on the group or on command is not an acceptable value.

## **System action**

Retry the command using only task numbers that you attached to. Use the tasks command to display a list of valid task numbers.

**FOMOH2111** 

Task number has requested exit.

## **Explanation**

The indicated task has attempted to exit. The program terminates when all tasks have requested exit.

# **System action**

None. This is an informational message.

#### **FOMOH2112**

The syntax: "on context" is valid at the pdbx-subset prompt, but "on context command" is not.

## **Explanation**

While at the pdbx-subset prompt, the on context command form of the on command was issued. The only valid form of the on command at the pdbx-subset prompt is on context.

# **System action**

Retry the on command using syntax: on context.

#### **FOMOH2113**

The following are valid at the pdbx-subset prompt: commands listed

### **Explanation:**

pdbx help screen for commands available at the pdbx-subset prompt.

## System action

None.

#### **FOMOH2114**

The correct syntax is: 'string'.

#### **Explanation:**

You issued incorrect syntax, and the correct syntax is displayed as part of this message.

#### **System action:**

Retype the command using the syntax displayed.

#### **FOMOH2115**

Switching to context: "string", where there is at least one RUNNING task. When these RUNNING task(s) reach a breakpoint or complete execution, a pdbx prompt is displayed.

#### **Explanation:**

You issued the on context command at the pdbx-subset prompt. The target context has some tasks that are RUNNING. This is an informational message to let you know that a pdbx prompt will not be displayed immediately.

### **System action:**

Either wait for the pdbx prompt or issue a <Ctrl-c> to enter get a pdbx-subset prompt. You can then use the tasks or group list command to view the state of the tasks. The on command is available at the pdbx-subset prompt if you want to then switch to a different context.

### **FOMOH2116**

Group "string" has been deleted, because it has no members.

#### **Explanation:**

The group delete command has been issued. All of the members in the group were specified to be deleted, so the group itself was also deleted.

## **System action:**

None. This is an informational message.

# FOMOH2117

Group "string" has been deleted.

#### **Explanation:**

You issued the group delete command and the group has been successfully deleted.

### **System action:**

None. This is an informational message.

#### **FOMOH2118**

No action was taken because task(s): "string" are currently RUNNING, and because the specified group has breakpoints or tracepoints set for it. Only tasks in the DEBUG READY state can be added to a group which has group breakpoints or tracepoints set.

### **Explanation:**

You issued the group add command. This group had some group events (breakpoints or tracepoints) set. When adding a task to this group, the group events will be added for the new task. To add an event, the task must be able to send debugger commands to the remote debugger. In this case, the tasks listed were not in the DEBUG READY state so that remote debugger commands could be issued.

#### **System action:**

Use the tasks and group list commands to view the state of the tasks. To change the state of tasks, use the halt command and <Ctrl-c> to bring up a pdbx-subset prompt.

#### **FOMOH2119**

No action was taken because task(s): "string" are currently RUNNING, and because the specified group has breakpoints or tracepoints set for it. Only tasks in the DEBUG READY state can be deleted from a group which has group breakpoints or tracepoints set.

#### **Explanation:**

You issued the group delete command. This group had some group events (breakpoints or tracepoints) set. When deleting a task from this group, the group events will be deleted from the deleted task. To delete an event, the task must be able to send debugger commands to the remote debugger. In this case, the tasks listed were not in DEBUG READY state so that remote debugger commands could be issued.

### **System action:**

Use the tasks and group list commands to view the state of the tasks. To change the state of tasks, use the halt command and <Ctrl-c> to bring up a pdbx-subset prompt.

#### **FOMOH2120**

All attached tasks have exited. Type either "detach" or "quit" to exit the debugger, and then restart pdbx if you wish to continue debugging. Reminder: "quit" also causes the poe job to be terminated, while "detach" does not.

#### **Explanation:**

All the tasks of the partition have exited.

### **System action:**

Issue the "quit" or "detach" pdbx command.

#### FOMOH2121

No action has been taken because the partition is already loaded.

#### **Explanation:**

You issued the load command after the partition was already loaded.

#### **System action:**

The load command is not valid after the partition has been loaded.

#### FOMOH2122

This event cannot be set because task: number is unhooked.

#### **Explanation:**

You issued a trace or stop command against a task that is unhooked. This pdbx command requires that the task be in DEBUG READY state.

#### **System action:**

You can use the hook command to regain debugger control of previously unhooked tasks. Issue the group list or tasks command to see which tasks are unhooked.

# FOMOH2123

This event cannot be set because some task(s) in the group are unhooked.

#### **Explanation:**

You issued a trace or stop command against a group which contains some task(s) that are unhooked.

#### **System action:**

The hook command can be used to regain debugger control of previously unhooked tasks. You can create another group which does not contain any tasks that are in the unhooked state.

#### **FOMOH2124**

Could not add event to task: number, because it is in state: "string".

## **Explanation:**

### **FOMOH** messages

You issued a trace or stop command against the task specified in the message. No action was taken on behalf of this task because the task was not in DEBUG READY state.

### **System action:**

If the task is unhooked, the hook command will bring the task to DEBUG READY state. If the task is RUNNING, the halt command will interrupt the task and bring it to DEBUG READY state. If the task has exited, events cannot be set.

**FOMOH2125** 

Could not delete event: "number" from task: "number", because it is in state: "string".

#### **Explanation:**

You issued the delete command with the task identified in the message as the current context, but the task was not in DEBUG READY state. The task must be in DEBUG READY state so that the remote debugger can record the fact that the event has been deleted. No action has been taken.

### **System action:**

If the task is unhooked, use the hook command to bring it to DEBUG READY state.

**FOMOH2126** 

Could not delete event: "number" from task: number of this group on the remote node, because it is in state: "string".

### **Explanation:**

You issued the delete command against the current context which is a group. The task listed in the message is a member of this group. No events can be deleted from the task because the task is not in debug ready state. The group event has been deleted on the home node. If the task is unhooked, this event will not be reset when the task is again hooked.

## **System action:**

When the task is again in DEBUG READY state, issue the on taskid dbx status command to manually check the event's status on the remote debugger.

**FOMOH2128** 

The correct syntax is: 'group list [ group\_name ]'.

## **Explanation**

You issued the group list with incorrect syntax.

# **System action**

Re-issue the command specifying either group list to see the tasks and states which belong to all groups or group list followed by a group name to see the tasks and states that belong to a specific group.

**FOMOH2129** 

No action was taken because the group name contained nonalphanumeric characters.

# **Explanation**

The group name specified was made up of some character(s) that were neither alphabetic nor numeric.

## **System action**

Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

**FOMOH2130** 

No action was taken because the group name specified was null.

### **Explanation**

You issued one of the group commands, but no group name was provided.

Provide a group name that is no longer than 32 characters, which starts with an alphabetic character, and is followed by any alphanumeric combination.

**FOMOH2131** 

All tasks have exited. Issue quit then restart the debugger if you wish to continue debugging.

# **Explanation**

All the tasks of the partition have exited.

# **System action**

Issue the quit command to exit pdbx.

**FOMOH2132** 

The help command failed because two or more arguments were specified. Issue help for a list of commands and topics that have help. Issue 'help command' or 'help topic' to view the help text.

# **Explanation**

You issued the help command with more than one argument.

# **System action**

Re-issue the help command with one argument. Issue help alone for a list of valid arguments.

**FOMOH2133** 

The help command did not recognize the command or topic specified. Issue help for a list of commands and topics that have help. Issue 'help command' or 'help topic' to view the help text.

## **Explanation**

You issued the help command with an unrecognized argument.

## **System action**

Re-issue the help command with a valid argument. Issue help alone for a list of valid arguments.

FOMOH2134

To begin debugging in attach mode, select a task or tasks to attach.

## **Explanation**

Informational message. Part of **pdbx** attach tasks menu.

## **System action**

None.

**FOMOH2135** 

Task IP Addr Node PID Program

## **Explanation**

Informational message. Part of **pdbx** attach tasks menu.

## System action

None.

#### **FOMOH2136**

At the pdbx prompt enter the "attach" command followed by a list of tasks or "all". (ex. "attach 2 4 5-7" or "attach all") You may also type "help" for more information or "quit" to exit the debugger without attaching.

## **Explanation**

Informational message. Part of **pdbx** attach tasks menu.

# **System action**

None.

#### **FOMOH9000**

pdbx is terminating.

#### **Explanation:**

pdbx is terminating normally.

# **System action:**

Have a nice day.

#### **FOMOH9039**

#### Cannot read attach configuration file.

#### **Explanation:**

pdbx could not read the attach configuration file, which is created when the original POE job was started, and is removed when the job ends.

# System action

- 1. Make sure the correct POE process id was used when invoking the debugger.
- 2. Check the /tmp directory for the existence of a config file containing the POE process id. (For example, check /tmp/.ppe.<poe pid>.attach.cfg).

### **FOMOH9040**

### Cannot open attach configuration file.

#### **Explanation:**

pdbx was unable to open the attach configuration file.

### **System action**

- 1. Make sure that the correct POE process id was used when invoking the debugger.
- 2. Check the /tmp directory for the existence of a configuration file containing the POE process id. (For example, check for /tmp/.ppe.34192.attach.cfg).

#### **FOMOH9041**

## Cannot locate attach configuration file "string".

## **Explanation:**

pdbx was unable to locate the attach configuration file.

# System action

- 1. Make sure that the correct POE process id was used when invoking the debugger.
- 2. Check the /tmp directory for the existence of a configuration file containing the POE process id. (For example, check for /tmp/.ppe.34192.attach.cfg).

## **FOMOH9042**

### No tasks listed in attach configuration file.

### **Explanation:**

The attach configuration file created when the original POE job was started contained a zero in the first field indicating that POE is between job steps.

#### **System action:**

Wait for the next job step to start which will take a few seconds. Then you can re-enter pedb in attach mode, if you wish.

### **FOMOH9043**

The command "string" is not valid when debugging in attach mode.

### **Explanation:**

The command is not valid when debugging in attach mode.

### **System action:**

Use a different command.

### **FOMOH9044**

Could not write to poe debug socket.

#### **Explanation:**

pdbx was unable to write to the POE debug socket.

#### **System action:**

The debugger was unable to communicate to POE that the debugger is detaching. Please note that the debugger will most likely not be able to re-attach to this POE job.

#### **FOMOH9045**

The "detach" command can only be used when running in attach mode.

### **Explanation:**

The "detach" command is only valid if the debugger has been attached to a set of tasks.

### **System action:**

Use quit to exit the debugger if running in normal mode.

#### **FOMOH9046**

The correct syntax is: 'string'.

#### **Explanation:**

You issued incorrect syntax, and the correct syntax is displayed as part of this message.

#### **System action:**

Retype the command using the syntax displayed.

#### **FOMOH9047**

An instance of pdbx has already been attached to this POE job.

#### **Explanation:**

Only one instance of the debugger may be attached to a given POE job at a time. The existence of the /tmp/.pdbx.cpoe-pid.host.list file indicates that a debugger has already attached to this POE job.

#### **System action:**

If pdbx isn't currently attached to the POE job in question, remove the corresponding /tmp/.pdbx.poe-pid>.host.list file in /tmp, and try again.

#### **FOMOH9048**

The following flag(s) are not valid when starting the debugger in attach mode - 'string'. Please check for valid flags and retry.

#### **Explanation:**

The user attempted to start pedb in attach mode with a command line flag(s) that is not valid. The error message is given and the debugger exits.

#### **System action:**

The user should check for valid command line flags and try again.

# **FOMOH9049**

The following environment variables have been ignored since they are not valid when starting the debugger in attach mode - 'string'.

#### **Explanation:**

Some of the environment variables the user has set are not valid when starting pdbx in attach mode. A message is given indicating what variables have been ignored. The debugger continues.

### **System action:**

Note any environment variable of interest that have been ignored. This message exists to highlight the fact that some of the environment variables that normally have an effect when the POE job is Initially started will not have an affect by having them set when the debugger is invoked for attach.

**FOMOH9999** 

pdbx is exiting.

### **FDBX** messages

#### **Explanation:**

pdbx is terminating due to an error as opposed to a deliberate action. Generally, this message is preceded by a specific message which gives the reason why pdbx is quitting prematurely.

### **System action:**

Refer to the message on the screen that precedes this error message.

# z/OS Debugger messages

## **FDBX**

#### FDBX0001

#### incompatible types

#### **Explanation:**

You tried to assign a value to a variable, but the type of the expression is not the same as the type of the variable, so the assignment was not performed.

## **User response:**

Reenter the assign subcommand where the type of the variable matches the type of the expression.

### FDBX0003

### invalid signal number

#### **Explanation:**

The signal that you specified is not a known signal name or valid signal number. The subcommand is not performed.

### **User response:**

Reenter the subcommand and specify a valid signal number or name.

#### FDBX0004

#### no valid modules were found in the load map.

#### **Explanation:**

The loadmap appears to be empty.

### **User response:**

If you are attempting to debug a sticky-bit program, you must place a set \$sticky\_debug statement in the .dbxsetup file and restart the dbx debugger.

#### **FDBX0005**

#### string is not a block

#### **Explanation:**

You used a symbol that is not a block in a context where only a block is allowed.

#### User response

Reenter the subcommand and specify a \$bxxx-type symbol.

#### **FDBX0008**

#### expected a symbol, found string

# **Explanation:**

You used an expression where only a symbol name is allowed.

#### **User response:**

Reenter the subcommand and specify a symbol where it is expected.

#### **FDBX0010**

### string is not a procedure or function

## **Explanation:**

You used a symbol that is not a subprogram name where only a subprogram name is allowed.

#### **User response:**

Reenter the subcommand and specify a subprogram name where it is expected.

## FDBX0011

CEEEVDBG has not been loaded properly. The current dbx operation is canceled.

#### **Explanation:**

When installed, CEEEVDBG provides additional functionality to the BPX1PTRA syscall that dbx uses to control the process/program begin debugged. dbx has detected that Language Environment did not load CEEEVDBG during user program initialization.

### **User response:**

Report the problem to the MVS system programmer. SYS1.SAMPLIB(CEEEVDBG) contains sample HASM source for the CEEEVDBG module that dbx requires.

FDBX0012 execv failure: string

#### **Explanation:**

dbx was unable to execute the desired debug target program.

#### **User response:**

Ensure that you have specified the correct filename of the debug target, and that it has the proper permissions.

### FDBX0016 symbol not defined

#### **Explanation:**

The symbol is not known to dbx.

### **User response:**

Reenter the subcommand with a symbol that is defined in the program where the file has been compiled with -g. Not that symbols in DLLs are not known to dbx until the symbolics for the DLL have been read.

#### FDBX0017

unexpected "at " or "in "

#### **Explanation:**

You used incorrect syntax for a stop or trace subcommand.

#### **User response:**

Reenter the stop or trace subcommand and use the correct syntax.

### FDBX0018

Storage access failed, target=hex-number, source=hex-number, size=hex-number

#### **Explanation:**

dbx attempted to access storage that it could not read or write to.

#### **User response:**

Verify the source, target or size fields. Verify the symbol/value specified on the dbx subcommand that caused the error. Follow local procedures for reporting problems.

## FDBX0019

Program start spawn failure, attempting fork/exec; errno=number, errno2=hex-number: string

## **Explanation:**

dbx could not start the program using spawn for the given errno, errno2 reason. A fork/exec will now be attempted to start debugging the program.

#### **User response:**

None.

#### FDBX0020

### cannot trace expressions

## **Explanation:**

You specified an expression to be traced. Only variables can be traced.

#### **User response:**

Reenter the trace subcommand and specify a variable to be traced.

### FDBX0022

### missing variable to watch

### **Explanation:**

The watch subcommand was specified without a variable to watch.

## **User response:**

Reenter the watch subcommand with the desired variable to watch.

### expected variable to watch, found string

### **Explanation:**

The watch subcommand was specified with an argument other than a program variable.

#### User response:

Reenter the watch subcommand with the desired variable to watch.

### **FDBX0024**

bad binary op type: string

#### **Explanation:**

dbx encountered a bad binary operation type node while processing a binary operation.

#### **User response:**

Follow local procedures for reporting problems.

#### **FDBX0026**

### expected variable, found string

#### **Explanation:**

The stop subcommand expected a variable name but found another type of symbol.

#### **User response:**

Reenter the stop subcommand and specify a variable name.

#### FDBX0027

#### expected subprogram, found string

#### **Explanation:**

You specified an expression for a stop subcommand in a position where only a subprogram name is allowed.

#### **User response:**

Reenter the stop subcommand and specify a subprogram name.

#### **FDBX0028**

### string is not a subprogram

#### **Explanation:**

You used a symbol that is not a subprogram in a context where only a subprogram is allowed.

#### **User response:**

Reenter the subcommand and specify a subprogram name.

#### **FDBX0030**

missing line

#### **Explanation:**

You omitted the line number in a stop or trace subcommand.

#### **User response:**

Reenter the stop or trace subcommand and specify a line number.

## FDBX0031

### expected source line number, found string

### **Explanation:**

The stop or trace dbx subcommand was expecting a source file line number.

## **User response:**

Reenter the dbx subcommand specifying a source file line number.

### FDBX0032

missing address

#### **Explanation:**

You omitted the address in a subcommand.

### **User response:**

Reenter the subcommand and specify an address.

#### FDBX0033

#### expected address, found string

#### **Explanation:**

You specified the wrong address in a subcommand.

#### **User response:**

Reenter the subcommand and specify the correct address.

#### **FDBX0034**

Found storage damage at *hex-number* with guard before, size=*number*, index=*number* 

#### **Explanation:**

dbx was running with internal storage checking on which detected storage damage.

### **User response:**

Follow local procedures for reporting problems.

#### **FDBX0035**

Found storage damage at *hex-number* with guard after, size=*number*, index=*number* 

#### **Explanation:**

dbx was running with internal storage checking on which detected storage damage.

#### **User response:**

Follow local procedures for reporting problems.

**FDBX0036** 

tracestorcnt overlow: number

#### **Explanation:**

dbx was running with internal storage checking on which ran out of table space while attempting to add a new storage trace entry.

#### **User response:**

Follow local procedures for reporting problems.

#### **FDBX0039**

### **Bad INSPECT subcode passed from LE:** number

#### **Explanation:**

dbx received a bad INSPECT type sub-operation from the LE debugger exit. dbx ignores the bad sub-operation and continues processing.

### **User response:**

Follow local procedures for reporting problems.

#### FDBX0042

#### fast next detected a loop after number retries

#### **Explanation:**

dbx next processing encountered a problem where it appears to be in an endless loop.

#### **User response:**

dbx should be able to step/next/cont from this stopping point. Follow local procedures for reporting problems.

#### FDBX0043

#### step detected a loop after *number* retries

### **Explanation:**

dbx step processing encountered a problem where it appears to be in an endless loop.

#### **User response:**

dbx should be able to step/next/cont from this stopping point. Follow local procedures for reporting problems.

### **FDBX0044**

### catchfault called with number, pid=number

### **Explanation:**

dbx received an unexpected signal during processing and will perform termination processing.

#### **User response:**

Follow local procedures for reporting problems.

### **FDBX0045**

### Unreadable data at hex-number

#### **Explanation:**

dbx was unable to read storage at the given address.

## **User response:**

Retry the operation. If the failure persists, follow local procedures for reporting problems.

#### **FDBX** messages

**FDBX0048** 

Set an event like "st in main" then use "c" to start debugging.

**Explanation:** 

dbx suggestion as to how to start debugging your program.

**User response:** 

None.

FDBX0050

assertion failed at line number in file string

# **Explanation**

An internal dbx error occurred.

**User response:** 

Follow local procedures for reporting problems.

FDBX0051

context includes more than one block

# **Explanation**

An internal dbx error occurred.

**User response:** 

None.

**FDBX0052** 

Cannot handle more than one block from whatblock()

## **Explanation**

An internal dbx error occurred.

**User response:** 

None.

FDBX0053

SIGSEGV occurred during command line editing

### **Explanation**

An internal dbx error occurred.

**User response:** 

None.

**FDBX0054** 

eval: bad op *number* for redirectout

## **Explanation**

A redirection operation failed with an internal error

**User response:** 

Follow local procedures for reporting problems.

FDBX0055 eval: bad op *number* for redirection

# **Explanation**

A dbx redirection operation experienced an internal error.

**User response:** 

Follow local procedures for reporting problems.

**FDBX0056** 

assign non-composite to composite

**Explanation:** 

None.

868 z/OS: z/OS UNIX System Services Messages and Codes

**User response:** 

None.

FDBX0057 Node op error at \"string\":number

**Explanation:** 

None.

**User response:** 

None.

FDBX0058 reference through null pointer at line number in file string

## **Explanation**

dbx attempted to dereference a null pointer

**User response:** 

Follow local procedures for reporting problems.

FDBX0059 Could not find low address of die

**Explanation:** 

None.

**User response:** 

None.

FDBX0060 Could not find high address of die

**Explanation:** 

None.

**User response:** 

None.

FDBX0062 subscript must be integer-compatible

## **Explanation**

An array subscript must be integer-compatible.

## **User response**

Reenter the dbx subcommand specifying an integer-compatible value for the expression for an array subscript.

FDBX0064 step detected a recursion after *number* retries

## **Explanation**

dbx step processing encountered a problem where it appears to be in an endless loop.

### **User response**

dbx should be able to step/next/cont from this stopping point. Follow local procedures for reporting problems.

FDBX0065 step detected a no-source to no-source program loop

### **Explanation**

dbx step processing encountered a problem where it appears to be in an endless loop.

# **User response**

dbx should be able to step/next/cont from this stopping point. Follow local procedures for reporting problems.

"string" is not a valid selection

# **Explanation**

The user entered an invalid selection.

## **User response**

Reenter the dbx subcommand specifying a valid selection.

#### **FDBX0068**

Selection must be between number-number

# **Explanation**

The user entered an invalid selection.

## **User response**

Specify valid selection.

FDBX0069

Ambiguous file "filename"; arbitrarily choosing.

## **Explanation**

dbx encountered two files with the same name in different paths when trying to display a source line. Since it is not possible to determine which is the correct file, the first one located in the dbx "use" path is chosen. This may or may not be correct, depending on the circumstances.

## **User response**

Either ignore the error, and note that the source code as displayed may not match what dbx is actually running, or modify your program so that all of its files have unique names.

#### FDBX0071

**Process finished unexpectedly** 

# **Explanation**

The process being debugged finished unexpectedly.

### User response

Restart the process via the "run" or "rerun" subcommands.

#### FDBX0072

Cannot change register - register is read-only.

# **Explanation**

You tried to change the value of a read-only register.

## **User response**

Specify a different register to write to.

#### **FDBX0074**

Unable to query kernel for process info

## **Explanation**

dbx attempted to call the kernel for information about the process being debugged, but the call failed.

# **User response:**

Follow local procedures for reporting problems.

870 z/OS: z/OS UNIX System Services Messages and Codes

### dread passed zero length

## **Explanation**

The user process data read routine was called to read a zero length buffer.

### **User response:**

Follow local procedures for reporting problems.

### **FDBX0076**

could not call instruction decoder routine.

## **Explanation**

dbx tried to fetch() the address of the z/OS instruction decoder, and the fetch() failed. This will result in degraded assembler listings and the inability to decode instructions.

### **User response:**

Follow local procedures for reporting problems.

#### **FDBX0078**

cannot find symbol for program counter (\$pc)

# **Explanation**

This dbx internal error indicates that the internal symbol corresponding to the program counter of the program could not be located. This will cause some stop and trace subcommands to have unpredictable behavior.

#### **User response:**

Follow local procedures for reporting problems.

#### **FDBX0082**

string is not active

## **Explanation**

The program is not running, or there is no stack frame containing an instance of a variable in string.

### **User response**

Stop in a function where the variables in *string* are active, or use the run or rerun subcommand to restart the program, or exit dbx with the quit subcommand.

## FDBX0083

cannot evaluate a string

# **Explanation**

You either specified a *string* that cannot be evaluated because there is no method to evaluate a *string* of this type, or you are attempting to typecast with the parameters specified incorrectly.

### **User response**

Reenter the failing subcommand and specify a valid symbol type.

### **FDBX0086**

invalid assignment

## **Explanation**

You can only change the value of exit\_status in thread type variables. Assignment to another other field in thread, mutex or condition variable type variables is not allowed.

# **User response**

Reenter the subcommand and specify a different variable.

#### double free detected! hex-number

## **Explanation**

dbx tried to free storage that was already freed.

#### **User response:**

Follow local procedures for reporting problems.

**FDBX0088** 

error: division by 0

## **Explanation**

You specified an expression containing a division by zero.

### **User response**

Reenter the subcommand and specify a nonzero divisor.

FDBX0089

dbx for z/OS (with 64-bit support).

## **Explanation**

The message tells you if dbx is compiled with support for 64-bit programs.

#### **User response:**

None.

**FDBX0090** 

cannot read string

## **Explanation**

dbx couldn't read the named source file.

## User response

Use the file subcommand to verify the name of the current source file. Check the permissions for the source file.

## FDBX0091

Storage allocated by func should not be freed by func

### **Explanation**

Storage allocated by safe\_malloc31 should be freed by safe\_free31. Mixing the routines with the default allocation ones can be hazardous.

### **User response:**

Follow local procedures for reporting problems.

#### FDBX0092

Zero-byte allocation detected!

## **Explanation**

An internal dbx routine attempted to allocate zero-bytes of storage. This is most likely a bug.

#### **User response:**

None.

### FDBX0095

Symbols are not folded (mixed).

# **Explanation**

dbx is not changing the case of user-typed symbol names.

872 z/OS: z/OS UNIX System Services Messages and Codes

**User response:** 

None.

**FDBX0096** 

Symbols are folded to lower case.

## **Explanation**

dbx is changing the case of user-typed symbol names to lowercase.

**User response:** 

None.

FDBX0097

Symbols are folded to upper case.

# **Explanation**

dbx is changing the case of user-typed symbol names to uppercase.

**User response:** 

None.

FDBX0098

Symbols are folded based upon current language.

## **Explanation**

dbx is changing the case of user-typed symbol names, depending on the programming language currently associated with your program.

**User response:** 

None.

FDBX0100

Type 'help' for help.

## **Explanation**

This message explains how to get help information.

**User response:** 

None.

FDBX0101

no executable code at line lineNumber

## **Explanation**

You tried to place a breakpoint at a source line number with no runnable code associated with it in the program. This *line* is followed by an interpretation of the specified source line.

## User response

Specify the stop or trace subcommand with a valid source line number.

**FDBX0103** 

Attempt to resolve "wildcards" in run or rerun failed.

## **Explanation**

dbx couldn't interpret the parameters for a run or rerun subcommand.

### **User response**

Reenter the subcommand and specify valid metacharacters.

**FDBX0104** 

non-positive repetition count

### **FDBX** messages

## **Explanation**

You specified a non-positive number of machine instructions to display.

## **User response**

Reenter the subcommand with a positive count.

FDBX0105

too many arguments

# **Explanation**

dbx couldn't pass all of the parameters to the program because there were too many. The limit is 1000 parameters.

## User response

Specify the run or rerun subcommand with fewer parameters.

**FDBX0107** 

unknown event number

## **Explanation**

You specified a stop or trace event id that does not match any known stop or trace events.

## **User response**

Reenter the subcommand and specify a valid event ID.

**FDBX0109** 

multiple input redirects

# **Explanation**

You specified more than one file to redirect input to the program. Only one is allowed, and only the first file will be used.

### **User response**

Reenter the subcommand and specify only one redirect input.

FDBX0110

cannot continue execution

# **Explanation**

dbx cannot continue running the program because it is not known to be in a stopped state.

### User response

Check that your process is still active and that the program did not exit.

FDBX0111

source file string not found or not compiled with debug information.

## **Explanation**

The source file was not compiled with the option to support symbolic debugging.

### **User response**

You can perform only machine-level debug.

FDBX0112

bad print format string

874 z/OS: z/OS UNIX System Services Messages and Codes

# **Explanation**

The format of the memory display was specified incorrectly.

### **User response**

Reenter the display memory subcommand with the correct display format.

FDBX0113

Program terminated by signal number (signal description).

## **Explanation**

The program ended because it received a signal *number*.

## User response

Use the run or rerun subcommand to restart the program, or exit dbx with the quit subcommand.

**FDBX0114** 

program exited

## **Explanation**

The program terminated with a return code of zero.

## **User response**

Use the run or rerun subcommand to restart the program, or exit dbx with the quit subcommand.

**FDBX0115** 

program exited with code number

# **Explanation**

The process being debugged completed with a nonzero return code.

**User response:** 

None.

**FDBX0116** 

string(): nbytes=number is not valid

## **Explanation**

The process being debugged completed with a nonzero return code.

**User response:** 

None.

**FDBX0117** 

Stack entryid: number is larger than stack count: number

## **Explanation**

Stack entryid should not be larger than stack count.

**User response:** 

None.

**FDBX0124** 

Could not alter multi-processing mode.

## **Explanation**

dbx encountered a system error while trying to change the multi-process debugging mode.

### **User response:**

Follow local procedures for reporting problems.

Could not detach from process. Use quit.

## **Explanation**

dbx encountered a system error while trying to detach from the user program.

## **User response**

Use the quit subcommand to end the debugging session. Follow local procedures for reporting problems.

**FDBX0126** 

eval: bad op *number* 

# **Explanation**

This is a dbx internal error. The dbx expression tree contains an operation that is unknown to dbx.

#### **User response:**

Follow local procedures for reporting problems.

**FDBX0127** 

source file *file-name* not found or not compiled with debug information; event id = [id]

## **Explanation**

The file specified in the stop event was not found. A deferred breakpoint has been created instead.

### **User response:**

None.

**FDBX0134** 

Unknown debug flag

## **Explanation**

You used the debug subcommand with an incorrect argument.

### **User response**

Reenter the debug subcommand with a different parameter.

**FDBX0135** 

Unknown node operator

### **Explanation**

An internal dbx error occurred

### **User response:**

Follow local procedures for reporting problems.

FDBX0136

func: bad op number

## **Explanation**

This is a dbx internal error. The dbx expression tree contains an operation that is unknown to dbx.

#### **User response:**

Follow local procedures for reporting problems.

**FDBX0137** 

Couldn't set size of string

# **Explanation**

dbx tried to set the size of a register, but was unsuccessful.

### **User response:**

Follow local procedures for reporting problems.

#### FDBX0138

string is an unusual operand for examining modification

## **Explanation**

You are trying to trace modification to a memory location that is not normally modifiable, such as a subprogram entry point.

## **User response**

Reenter the trace subcommand and specify a variable.

FDBX0141

no source lines for string

# **Explanation**

You tried to list the source lines to a subprogram that has no associated line number information.

## **User response**

Reenter the list subcommand after compiling the current subprogram with the -g option.

FDBX0142

Setting '\$frame' is not supported.

## **Explanation**

The '\$frame' debugger variable cannot be modified.

## **User response**

Issue a different subcommand.

#### FDBX0143

line numbers must be positive

### **Explanation**

You specified a nonpositive line number to start listing lines from.

## **User response**

Reenter the list subcommand with positive line numbers.

**FDBX0144** 

second number must be greater than first

### **Explanation**

The specified ending line number was smaller than the beginning line number.

# **User response**

Reenter the subcommand and ensure the ending line number is larger than the beginning line number.

**FDBX0145** 

No file to move within

# **Explanation**

You issued the move subcommand when there is no current file.

## **User response**

First enter the file subcommand to set the source file, then reissue the move subcommand.

**FDBX0146** 

Line specified is not within range of string

# **Explanation**

You tried to move the current line number to be listed to a line number that is outside of the range of the current source file.

# **User response**

Reenter the move subcommand and specify a line number within the bounds of the current source file.

**FDBX0147** 

Could not set stack frame register number.

# **Explanation**

dbx tried to set the symbolic name of the register containing the stack pointer, but was unsuccessful.

### **User response:**

Follow local procedures for reporting problems.

FDBX0148

Note: dbx31 and dbx64 should not be invoked directly. Doing so may cause undefined behavior.

# **Explanation**

The dbx debugger was invoked directly, rather than through the dbx front end. Running dbx in this manner is not supported.

### User response

Start the dbx debugger via the dbx shell command.

FDBX0149

No assembly code for that source line number

## **Explanation**

You tried to list the machine instructions for a source line number that has no associated machine instructions in your program.

## **User response**

Reenter the listi subcommand with a valid source line number.

FDBX0150

Debug target is *number*-bit

## **Explanation**

Informational message displaying the current amode of the process being debugged.

#### **User response:**

None.

FDBX0151

first address larger than second

# **Explanation**

You specified an incorrect range of memory to be displayed. The starting address was after the ending address.

## **User response**

Reenter the display memory subcommand with the correct memory range.

**FDBX0153** 

string is not active

# **Explanation**

You specified a local variable that is defined within a unused subprogram. Such a variable has no address or value in that situation.

# **User response**

Reenter the subcommand and specify a valid active variable.

**FDBX0155** 

no place to return to

# **Explanation**

The return subcommand couldn't complete because dbx couldn't find a return address for the named function.

## **User response**

Issue the where subcommand to find the current called sequence. Then reissue the return subcommand and specify one of the active functions. You can perform only machine-level debug.

**FDBX0156** 

Timeout waiting for kernel to service QUERY\_MODE request for pid number.

# **Explanation**

dbx stopped waiting for the kernel to service a request for the AMODE of the process, and cannot continue.

### **User response**

Use local error reporting methods.

**FDBX0163** 

Entering debugger...

### **Explanation**

After you invoked dbx with the -r option, the program ended unexpectedly.

### **User response**

Use dbx to determine why the program ended.

FDBX0171

string is not aliased

### **Explanation**

The user tried to interact with an alias that does not exist.

# **User response**

Reenter the alias command with an existing alias.

**FDBX0172** 

string is a program symbol -- use assign

#### **FDBX** messages

## **Explanation**

You used the set subcommand to change a program variable.

### **User response**

Use the assign subcommand instead of the set subcommand.

**FDBX0175** 

no process to write to

# **Explanation**

You are trying to alter the memory contents of a nonrunning program.

## User response

The program process is no longer available. Enter the run or rerun subcommand to restart the program process.

**FDBX0176** 

execution completed (exit code *number*)

## **Explanation**

The program completed with a nonzero exit code.

**User response:** 

None.

**FDBX0177** 

execution completed

# **Explanation**

The program completed with an exit code of 0.

**User response:** 

None.

FDBX0180

string is not a procedure or function

## **Explanation**

You tried to change the current function to a symbol that is not a subprogram.

### **User response**

Reenter the func subcommand and specify a procedure or function name.

FDBX0181

program is not executable

## **Explanation**

You tried to change the program counter of a program that cannot be run.

**User response:** 

None.

FDBX0182

Goto address is not within current function. (set \$unsafegoto to override)

## **Explanation**

You specified that the program counter of your program be changed to an address that is outside of the current function. This is not allowed unless you have set the debugger variable \$unsafegoto.

880 z/OS: z/OS UNIX System Services Messages and Codes

## **User response**

Either set \$unsafegoto and reissue goto, or specify a safe goto address.

**FDBX0185** 

hexints and octints are both set.

## **Explanation**

The hexints and octints internal variables are both enabled. This situation should never occur.

#### **User response:**

Follow local procedures for reporting problems.

FDBX0190

return detected a loop after number retries.

## **Explanation**

The return subcommand failed due to a non-terminating loop in the program being debugged.

## **User response**

Change the program being debugged so that the loop properly terminates.

FDBX0191

O\_WHICH bad op: number

# **Explanation**

The evaluator detected a node that it was not designed to process during the evaluation of an O\_WHICH node.

## **User response:**

Follow local procedures for reporting problems.

FDBX0192

The 31bit DBX cannot debug a 64bit program.

# **Explanation**

When DBX run in -m4(amode=31), it cannot debug the 64bit debugee program. If DBX encounter (run/attach/exec) a 64bit debugee, it will terminate.

### **User response**

None

FDBX0210

string: file already exists, use ">!"

### **Explanation**

You tried to redirect output of a subcommand to a file that already exists without specifying that the existing file be overwritten.

### **User response**

Reenter the subcommand and specify a different file, or use the append file operator (>>).

FDBX0211

cannot create string

## **Explanation**

dbx encountered an error while trying to redirect the output subcommand to the user-specified output file.

## **User response**

Reenter the subcommand and specify a different file or directory path.

FDBX0212

standard out dup failed

# **Explanation**

dbx encountered an error while trying to restore standard output.

#### **User response:**

Follow local procedures for reporting problems.

FDBX0213

filename: file already exists, use "2>!"

## **Explanation**

You attempted to route error output from a dbx subcommand to a file that already exists.

# **User response**

Reenter the dbx command specifying "2>!" to the same file, or choose a different file name.

**FDBX0214** 

standard err dup failed

## **Explanation**

dbx tried to do a dup() of stderr which failed.

## **User response**

Contact your system programmer.

FDBX0216

application forked, child pid=number, process stopped, awaiting input - use 'dbx -A number' on another terminal to establish a debug session for the child pid.

## **Explanation**

Heading produced for a user program that used a fork() system call while debugging in multiprocess debug mode.

# **User response**

Enter the specified subcommand on another terminal to start debugging the child of the fork() call.

**FDBX0217** 

application forked, parent process (pid) stopped, awaiting input

## **Explanation**

Heading produced for a user program that used a fork() system call while debugging in multiprocess debug mode. dbx is now attached to the parent process.

### **User response**

Continue to debug the parent process.

FDBX0218

application forked, child process (pid) stopped, awaiting input

# **Explanation**

Heading produced for a user program that used a fork() system call while debugging in multiprocess debug mode. dbx is now attached to the child process.

## **User response**

Continue to debug the child process.

#### FDBX0219

Could not open history log "filename" for appending.

# **Explanation**

The dbx command history could not be written out to the history log file.

# User response

Ensure that the history file is writable.

FDBX0223

string is not set

## **Explanation**

You tried to remove a debugger variable, but it was not set.

## **User response**

Use the set subcommand to display a list of debugger variables.

**FDBX0242** 

application *forked*, but child process was killed. Following parent process (*pid*).

## **Explanation**

Message produced for a user program that forked or spawned, but the child process was killed when in fork or spawn processing.

# **User response**

Use local error reporting methods.

### FDBX0243

application spawned, child pid=number, process stopped, awaiting input - use 'dbx - A number' on another terminal to establish a debug session for the child pid.

### **Explanation**

Message produced for a user program that used a spawn() system call while debugging in multiprocess debug mode.

### **User response**

Enter the specified subcommand on another terminal to start debugging the child of the spawn() call.

**FDBX0244** 

Application spawned, following parent process (pid).

## **Explanation**

Message produced for a user program that used a spawn() system call while debugging in multiprocess debug mode. dbx is now attached to the parent process.

## **User response**

Continue to debug the parent process.

**FDBX0245** 

Application spawned, following child process (pid).

## **Explanation**

Message produced for a user program that used a spawn() system call while debugging in multiprocess debug mode. dbx is now attached to the child process.

# **User response**

Continue to debug the child process.

**FDBX0246** 

subscript out of range

# **Explanation**

You specified a subscript to an array that is not compatible with the bounds of the array.

## **User response**

Reenter the subcommand and specify the correct array bounds.

FDBX0250

Attached location

## **Explanation**

dbx successfully attached to a running process and displayed the name of the function (if any) that it is currently stopped in.

## **User response**

None - informational only.

FDBX0251

Could not determine the object file name.

## **Explanation**

dbx couldn't determine the name of the object file associated with the specified running process.

## **User response**

Reenter the object file name when prompted by dbx.

FDBX0252

enter object file name (default is 'string', Control-D to exit):

## **Explanation**

dbx couldn't access the specified user program. It then prompts you to submit another name for the program or to exit dbx by entering Control-D.

## **User response**

Enter the object file name or control-D to exit.

FDBX0254

Stack trace follows

# **Explanation**

Message displayed before the stacktrace when attaching to a running program

### **User response**

None - informational only.

FDBX0255

cannot debug string; file not found.

## **Explanation**

dbx was unable to read the named source file.

# **User response**

Reenter the file subcommand and specify a source file name that exists in the current subdirectory or in the use path.

**FDBX0256** 

cannot debug string; file is a directory.

## **Explanation**

dbx was instructed to debug a directory.

## **User response**

Choose a valid executable file to debug, and restart dbx.

**FDBX0258** 

unknown option character

# **Explanation**

You specified an unknown option.

### **User response**

Reenter the alias subcommand and specify the correct options.

FDBX0259

Option character is deprecated and will be ignored.

## **Explanation**

You specified a legacy command line option that this version of dbx ignores. It is accepted for compatibility reasons.

### User response

Do not specify the option in the future.

FDBX0265

program is not active

## **Explanation**

The program has completed or has not begun.

## **User response**

Use the run or rerun subcommands to start the program.

FDBX0267

File string does not have execute permissions.

# **Explanation**

The file that dbx was instructed to debug does not have the execute permission bit set. This means that you may not be able to debug the program.

## **User response**

Set the execute bit on the file and rerun dbx.

FDBX0268

ptrace(PT\_LDINFO) failure

# **Explanation**

The ptrace() function call returned a -1 with the errno stating the error.

# **User response**

Retry the dbx command.

FDBX0269

Could not determine current function

## **Explanation**

dbx couldn't determine which function is currently active.

## **User response**

Check that the program process is still active. Verify that you are setting \$frame to the correct stack frame.

FDBX0271

no source file

# **Explanation**

There is no current source file to print.

FDBX0272

could not read string

## **Explanation**

dbx couldn't read the named source file.

## **User response**

Verify that the source file exists in the current directory in the path specified by the subcommand use, or in the -I dbx command line option.

FDBX0273

line number must be positive

## **Explanation**

The specified line number was a negative number.

# **User response**

Reenter the subcommand with a positive line number.

**FDBX0274** 

alias expansion too large

The expanded version of the aliased subcommand exceeds the length of the dbx command buffer (10240 characters).

# **User response**

Use the alias subcommand to redefine the alias.

FDBX0275

dynamic call of a function is not supported

# **Explanation**

Any reference to a function that must dynamically call the function is not supported.

**User response:** 

None.

FDBX0277

could not attach to pid number

# **Explanation**

You were not allowed to debug the process running with process ID number.

# **User response**

You must have kill authority to attach to the process. Contact your system programmer.

**FDBX0278** 

Waiting to attach to process number ...

# **Explanation**

dbx is waiting for the system's response to the request to debug the process running with process ID number.

### **User response:**

None.

FDBX0279

Attaching to process (pid) from exec...

# **Explanation**

dbx is waiting for the system's response to the request to debug the process that performed an exec() operation while multiprocess debug mode is enabled.

# **User response:**

None.

FDBX0280

cannot fork

# **Explanation**

dbx tried to execute a fork() to prepare to debug your program and it failed.

# **User response**

Contact your system programmer.

FDBX0281

Cannot execute string

# **Explanation**

dbx was unable to run the program.

# **User response**

Contact your system programmer.

#### FDBX0282

Commandline option missing an argument.

# **Explanation**

You specified a commandline option to dbx that requires an argument, but the argument was omitted.

# **User response**

Reinvoke dbx with the missing argument.

FDBX0283

cannot catch signal signal (signal name).

# **Explanation**

MVS signal processing does not allow you to catch the specified signal.

### **User response:**

None.

**FDBX0285** 

error number trying to continue process

# **Explanation**

dbx couldn't continue the program due to a system error.

# **User response**

Contact your system programmer.

**FDBX0286** 

'string' does not have a value."

# **Explanation**

The dbx keyword is missing a value. This is an internal error.

### **User response:**

Follow local procedures for reporting problems.

**FDBX0287** 

multiple error redirects

# **Explanation**

You specified more than one file to redirect stderr from your program.

### User response

Reenter the subcommand and specify only one redirect for stderr.

**FDBX0289** 

Internal error: could not detach from process.

# **Explanation**

The debugged process issued the fork() system call. dbx tried to remove breakpoints in the new debugged process, which were inherited from the parent process. However, dbx could not detach from the child process.

#### **User response:**

Follow local procedures for reporting problems.

# FDBX0290

multiple output redirects

888 z/OS: z/OS UNIX System Services Messages and Codes

You specified more than one file to redirect output from your program.

# **User response**

Reenter the subcommand and specify only one redirected output.

FDBX0295

store: could not write data at hex-number

# **Explanation**

dbx couldn't write data at address hexnum in the program.

# **User response**

Reenter the subcommand and specify a valid address for the program's data.

**FDBX0296** 

function not active.

# **Explanation**

The function specified as an argument to the return subcommand is not currently active.

# **User response**

Rerun the subcommand with a different function name, or run the program to a point where the specified function is active.

FDBX0297

signal "signal name" unknown.

# **Explanation**

You entered an unknown signal name.

# **User response**

Reissue the subcommand with a correct signal name.

**FDBX0298** 

not that many levels

# **Explanation**

You tried to traverse past the end of the stack.

# User response

Reissue the up or down subcommand with a smaller count.

FDBX0301

[internal error] upper 32 bits not zero

# **Explanation**

An internal dbx routine detected a parameter error.

#### **User response:**

Follow local procedures for reporting problems.

**FDBX0309** 

Cannot determine where to set a breakpoint. You must specify 'Procedure', 'SourceLine' or 'Address'.

# **Explanation**

You are trying to execute TRACE without any parameters when the current function is not known.

# **User response**

Reenter the trace subcommand with valid parameters.

# FDBX0310

missing ')' in macro call

# **Explanation**

You did not close the parameter list to an aliased subcommand with a).

# **User response**

Use the alias subcommand to redefine the alias.

# FDBX0311

Next line that will be listed is *line* 

# **Explanation**

The next source line that will be displayed via the list subcommand.

# **User response**

None - informational only.

# FDBX0313

not enough parameters in macro call

# **Explanation**

You did not specify enough parameters for an aliased subcommand.

# **User response**

Enter the alias subcommand for the alias to view the current definition. Reenter the subcommand with the correct number of parameters.

### **FDBX0315**

Keyword is not an address

# **Explanation**

The keyword specified was not an address.

### User response

Reenter the subcommand with an address.

# FDBX0317

too many parameters in macro call

# **Explanation**

You specified too many parameters for an aliased subcommand.

# **User response**

Enter the alias subcommand for the alias to view the current definition. Reenter the subcommand with the correct number of parameters.

# FDBX0318

missing actuals for macro

890 z/OS: z/OS UNIX System Services Messages and Codes

You did not specify parameters for an aliased subcommand that requires parameters.

# **User response**

Enter the alias subcommand for the alias to view the current definition. Reenter the subcommand with the correct number of parameters.

**FDBX0327** 

string has only 1 line

# **Explanation**

The specified line number was greater than the number of lines in the file.

# **User response**

Reenter the subcommand and specify a line number within the bounds of the source file.

**FDBX0328** 

string has only number lines

# **Explanation**

The specified line number was greater than the number of lines in the file.

# **User response**

Reenter the subcommand and specify a line number within the bounds of the source file.

FDBX0329

^ unrecognized command

# **Explanation**

You specified a command that is not a subcommand or user alias. The ^ must be at the beginning of the message.

# **User response**

Use the help subcommand to list the valid subcommands.

FDBX0330

initially (at line line in file):

# **Explanation**

Diagnostic message indicating where a traced variable was first found

# User response

None

FDBX0331

at line line in file:

# **Explanation**

Diagnostic message indicating that a traced variable has changed values.

# User response

None

FDBX0332

Multi-process debugging is status

# **Explanation**

The message indicates the current value of the dbx multi-process setting.

# **User response**

None - informational only.

FDBX0333

Multproc cannot be set when program is inactive.

# **Explanation**

The multproc subcommand cannot alter the multproc setting if the debuggee is not currently active.

# User response

Respecify the subcommand when the debuggee is active.

**FDBX0334** 

, ^ syntax error

# **Explanation**

You used the wrong syntax for a subcommand or user alias. The diacritic (^) must be at the beginning of the message.

# **User response**

Use the help subcommand to display the correct syntax for a subcommand.

**FDBX0335** 

non-terminated string

# **Explanation**

You did not close a character string with a quote character.

# **User response**

Reenter the subcommand and close all strings with a single quote character or a double quote character.

FDBX0336

**Bad target Amode** 

# **Explanation**

dbx encountered a bad AMODE internally.

# User response

Use local error reporting methods.

FDBX0337

cannot open string

# **Explanation**

dbx couldn't read a file that is supposed to contain subcommands.

# **User response**

Check that the file exists and that you have the correct permissions to read from it.

FDBX0338

goto/gotoi cannot be used when program is inactive.

The goto/gotoi subcommands cannot be used when the debuggee is not currently active.

# **User response**

Respecify the subcommand when the debuggee is active.

### FDBX0339

unreasonable input nesting on string

# **Explanation**

The nesting of subcommand files exceeded the dbx limit of ten.

# User response

Change the subcommand files to have less subcommand source nesting.

FDBX0340

second number must be greater than first

# **Explanation**

You specified a larger beginning than ending line number to be listed.

# **User response**

Reenter the list subcommand with the ending line number larger than the starting line number.

**FDBX0348** 

dbx wait() was interrupted by a signal.

# **Explanation**

dbx made a system call to wait() to obtain the status of the debuggee, and was interrupted by a signal. Overwrite this file.

# **User response:**

Use local procedures for error reporting.

FDBX0349

cannot write over running object file.

# **Explanation**

The specified file name on the dbx subcommand that is to be used for output is the currently running object file. dbx will not overwrite this file.

# **User response**

Reenter the dbx subcommand specifying a different file.

FDBX0351

cannot write filename

# **Explanation**

The specified file name on the dbx subcommand cannot be written by dbx.

# **User response**

Reenter the dbx subcommand specifying a file that you have write access to.

FDBX0352

cannot read filename

# **Explanation**

The specified file name on the dbx subcommand cannot be read by dbx.

# **User response**

Reenter the dbx subcommand specifying a file that you have read access to.

FDBX0353

no source for filename

# **Explanation**

The specified source file was not compiled to support symbolic debugging.

# User response

Reenter the edit subcommand on a file that was compiled with the -g option.

FDBX0356

no source file

# **Explanation**

You tried to search through a nonexistent file for a pattern.

# **User response**

Use the file subcommand to verify the name of the current source file.

**FDBX0357** 

An error occurred while getting the sourceline

# **Explanation**

The a function used to get a sourceline out of the debug side file returned an error.

# **User response**

Internal error. Follow local procedures for reporting problems.

FDBX0358

invalid regular expression

# **Explanation**

You specified a pattern that could not be compiled into a regular expression.

# **User response**

Reenter the subcommand and use a valid regular expression.

FDBX0359

no match

# **Explanation**

You specified a pattern that did not match anything in the current source file.

# **User response**

Reenter the subcommand and use a different pattern.

**FDBX0380** 

varname is not a pointer

You tried to use the de-reference variable on a variable that is not a pointer.

# **User response**

Use the whatis subcommand to determine the type of the variable. The \* prefix or ^ postfix operators can only be used on pointers. Reenter the subcommand with a pointer variable.

FDBX0381

expected variable, found string

# **Explanation**

You specified an incorrect expression to a stop subcommand in a position where only a variable is allowed.

# **User response**

Reenter the stop subcommand and specify a variable name.

FDBX0383

cannot typecast var/type\_name to type\_name

# **Explanation**

You attempted an illegal typecast operation

# **User response**

Use the whatis subcommand to determine the types of the operands. Typecasts are allowed only between base or pointer types. Reenter the subcommand with the correct typecast operation.

**FDBX0384** 

unknown member class: hex-number

# **Explanation**

The evaluator has received an unexpected tag.

# **User response**

This is an internal error. Report this problem to IBM via the appropriate service channel.

**FDBX0385** 

operation not defined on string

# **Explanation**

You tried an arithmetic or logical operation on an expression for which the operation is undefined.

# User response

Arithmetic or logical operations can only be performed on expressions that result in a numeric value. Reenter the subcommand and specify a numeric expression.

FDBX0390

A kernel call took too long to complete.

# **Explanation**

A system call to the z/OS UNIX kernel took too long to complete, and dbx's internal watchdog timer expired.

#### **User response:**

Use local procedures for error reporting.

FDBX0391

Unable to set multiprocess mode via ptrace.

# **Explanation**

dbx tried to set the multiprocess mode for the current process via a ptrace kernel call, but the call never succeeded. Multiprocess functionality may not work as expected.

# **User response:**

Use local procedures for error reporting.

**FDBX0396** 

symname is not an array

# **Explanation**

You specified dimensions for a symbol that is not an array or pointer.

# **User response**

Use the whatis subcommand to determine the definition for the symbol.

FDBX0399

Compiled: date at time

# **Explanation**

Informational message.

**User response:** 

None.

**FDBX0400** 

OS level

# **Explanation**

Information message reporting the result of uname -a.

**User response:** 

None.

FDBX0402

Removing no longer valid event [id]

# **Explanation**

A stop/trace event was removed because it is no longer valid.

# **User response**

Resubmit the stop/trace event at a point where it is valid.

FDBX0403

A stop/trace attempted to set a breakpoint at *hex-number* which is not currently a R/W storage address in your program. Your stop/trace event may not operate properly.

# **Explanation**

A stop/trace event tried to set a breakpoint in storage that is read-only.

# **User response**

Reenter the stop/trace event so that it points to read-write storage, and ensure that the program being debugged is loaded in read-write storage.

**FDBX0405** 

cannot step through protected code at hexnum

You tried to single-step your program into a privileged address space.

# **User response**

This may have occurred because the program took a wild branch. Verify the load point and size of the program using the map subcommand. Also verify the program counter using the registers subcommand.

#### **FDBX0407**

cannot step through breakpoint at hexnum

# **Explanation**

You tried to run your program in single-step mode through an instruction, which is the same as a breakpoint.

# **User response**

You are probably trying to step into a data area of the program that contains the breakpoint instruction (SVC 144). This may have occurred because the program took a wild branch. Verify the load point and size of the program using the map subcommand. Also verify the program counter using the registers subcommand.

### FDBX0408

A stop/trace event is attempting to set a breakpoint at read-only storage address *address*. The event may not operate properly. Do you want to continue? (Y/N):

# **Explanation**

You tried to set a breakpoint into read-only storage.

# **User response**

Enter Y or N. If you enter Y, the breakpoint wil be created. If you select N, the breakpoint will not be created.

### **FDBX0409**

Error number trying to step process

# **Explanation**

A ptrace (PT CONT) service call resulted in an error. The user program could not continue executing.

# User response

Record the error number and follow local reporting procedures.

### **FDBX0414**

Program exited with a return code of *number*.

### **Explanation**

The program terminated with the indicated return code.

# User response

Use the run or rerun subcommand to restart the program, or exit dbx with the quit subcommand.

# **FDBX0425**

Cannot display evaluation tree for unknown operation number

# **Explanation**

The operation to be evaluated is not a valid dbx operation.

# **User response**

Record the unknown operation. Follow local procedures for reporting errors.

**FDBX0437** 

No place on condition in condbp().

# **Explanation**

A dbx breakpoint is malformed. This is an internal error.

# **User response:**

Follow local procedures for reporting problems.

**FDBX0438** 

nsize found bad op: num

# **Explanation**

An internal dbx error occurred.

# **User response**

Record the error number and follow local reporting procedures.

**FDBX0439** 

swhatis found bad op: num

# **Explanation**

An internal dbx error occurred.

# **User response**

Record the error number and follow local reporting procedures.

**FDBX0446** 

Internal buffer overflow detected

# **Explanation**

dbx wrote off the end of an internal buffer. There is a possibility of heap damage.

# **User response**

dbx may behave erratically, depending on what data was overwritten. Restart dbx and see if the error happens again. Use local procedures for reporting errors.

**FDBX0447** 

too many arguments to type rename

# **Explanation**

Too many operands were given for a type rename operation.

# User response

Reenter the subcommand and specify the correct number of operands for the casting operation.

**FDBX0479** 

(internal error: bad instruction size in printop)

# **Explanation**

dbx encountered an internal error while determining the size of the current instruction.

# **User response**

Follow local procedures for reporting errors.

**FDBX0480** 

(internal error: bad tables in extmnem)

# **Explanation**

dbx encountered an error while decoding an extended mnemonic.

# **User response**

Follow local procedures for reporting errors.

**FDBX0485** 

libGeneralOutput size=number, maximum size=number

# **Explanation**

dbx encountered an fatal error while generating user output which caused an internal buffer to overflow.

# **User response**

Follow local procedures for reporting errors.

**FDBX0542** 

no breakpoints found at line

# **Explanation**

You tried to remove all of the breakpoints at a source line where no breakpoints could be found. This message is followed by an interpretation of the specified source line.

# **User response**

Reenter the clear subcommand and specify the correct source line.

FDBX0543

no breakpoints found at αddress

# **Explanation**

You tried to remove all of the breakpoints at an address where no breakpoints could be found. This message is followed by an interpretation of the specified address.

# **User response**

Reenter the cleari subcommand and specify the correct address.

**FDBX0544** 

Directory containing *string* could not be determined. Apply use command to initialize source path.

# **Explanation**

dbx couldn't determine the directory where the object file associated with a running process exists.

# **User response**

Issue the use subcommand and specify the directory where the source files can be found.

FDBX0551

Invalid floating point data size

You tried to print out the floating point registers, but dbx received an invalid floating point data size. This may be due to an internal error in dbx. The floating point registers will not be printed.

# **User response**

The floating point registers will not be printed for the current registers command. The user can ignore the error, or restart dbx.

**FDBX0552** 

unset \$noflregs to view floating point registers

# **Explanation**

Unset the \$noflregs dbx variable to enable display of the floating point registers.

# **User response**

Type 'unset \$noflregs' to enable display of the floating point registers. Ignore the message to continue suppressing their display.

FDBX0553

unset \$noflbregs to view IEEE floating point registers

# **Explanation**

Unset the \$noflbregs dbx variable to enable display of the IEEE floating point registers.

# **User response**

Type 'unset \$noflbregs' to enable display of the IEEE floating point registers. Ignore the message to continue suppressing their display.

FDBX0554

Usage: case { default | mixed | lower | upper }

# **Explanation**

The argument passed to the getcase function was incorrect.

# User response

Pass a valid case type to the getcase function

**FDBX0555** 

Invalid register lookup request: number

# **Explanation**

dbx tried to obtain the value of a nonexistent register.

# **User response:**

Use local procedures for error reporting.

**FDBX0556** 

Invalid general purpose register size.

# **Explanation**

The precision of the general purpose registers (GPRs) is invalid. The currently supported precisions are 32 and 64 bits.

# User response

None required.

900 z/OS: z/OS UNIX System Services Messages and Codes

# unset \$novregs to view vector registers

# **Explanation**

Unset the \$novregs dbx variable to enable display of the vector registers.

# **User response**

Type unset \$novregs to enable display of the vector registers. Ignore the message to continue suppressing their display.

#### **FDBX0558**

# unset \$noflbregs to view decimal floating point registers

# **Explanation**

Unset the \$noflbregs dbx variable to enable display of the decimal floating point registers.

# User response

Type 'unset \$noflbregs' to enable display of the decimal floating point registers. Ignore the message to continue suppressing their display.

#### FDBX0559

### The module map is incorrect

# **Explanation**

The loaded module contains a module map that does not have any information about the compile units. The debug information might be in executable files instead. Because the debug data cannot be found, errors are likely to happen when the debug data is parsed.

# **User response**

Delete the .mdbg file and try again. If you still encounter problems, contact your system administrator.

#### **FDBX0600**

ptrace(request=request, pid=process-id, addr=address, data=address, buff=request-text

# **Explanation**

Informational message showing a ptrace() request call by dbx.

### **User response:**

None.

# FDBX0601

ptrace(): addr=address, buff=address, r\_val=value, errno=error-number, errno-jr=error-number

# **Explanation**

Informational message showing the results of a ptrace() request call by dbx.

#### **User response:**

None.

# FDBX0602

symbol-name is not defined; event id = [id]

# **Explanation**

dbx information message. Since the symbol specified on the onload dbx subcommand is not currently known to dbx, it was added to the event list to be searched for after the symbolics are processed for a new DLL.

None.

**FDBX0610** 

object filename: "program"

# **Explanation**

This displays the filename of the object being debugged.

# **User response**

None - informational only.

FDBX0611

Internal Error: Problem occurred when locating string

# **Explanation**

**dbx** encountered a problem while trying to locate key information about the program.

# **User response**

Ensure that the program is compiled and linked correctly. If you still encounter problems, contact your system administrator.

FDBX0614

string is not defined

# **Explanation**

The specified symbol has not been defined in the program and is not a set variable.

# **User response**

Reenter the command specifying a defined symbol.

FDBX0619

An input value is out of range - results may be incorrect.

# **Explanation**

You specified a value that is out of range of what dbx can represent internally.

# **User response**

Reenter the command with a smaller input value.

**FDBX0620** 

string is not defined in

# **Explanation**

You specified a symbol that does not exist in the specified block.

# User response

Use the dump subcommand to determine which symbols are active in the current scope of the program.

**FDBX0625** 

string is not a pointer to a member.

# **Explanation**

The type of the symbol is not a member pointer.

# **User response**

Reenter the command specifying a member pointer symbol.

FDBX0626

string does not point to a member of class string

# **Explanation**

The specified symbol is not a pointer to the class.

# **User response**

Reenter the command specifying a pointer to class.

**FDBX0627** 

string is not a field in

# **Explanation**

The symbol is not a field in the struct/union/class.

# **User response**

Use the whatis dbx subcommand to see the members of the struct/union/class.

**FDBX0646** 

Type help <command> or help <topic> for help on specific items.

# **Explanation**

The user typed help with no arguments.

# **User response**

Retype 'help' and specify a command or topic.

**FDBX0650** 

Kernel function returned pid=pid, Amode=amode, Rmode=rmode, AmodeCap=amodecap, returnValue=returnValue, returnCode=returnCode, reasonCode=reasonCode

# **User response**

Informational message showing the result of a kernel call by dbx.

FDBX0651

Kernel function returned result=result, returnValue=returnValue, returnCode=returnCode, reasonCode=reasonCode

### User response

Informational message showing the result of a kernel call by dbx.

FDBX0654

string is not a known help topic or command

# User response

Reenter the help command with a valid topic or command.

FDBX0665

variable

# **Explanation**

dbx has stopped execution of your program since a signal arrived that it was instructed to catch.

# **User response**

Issue the cont subcommand to deliver the signal to the debuggee.

#### **FDBX0710**

run and rerun may be used only on originating process.

# **Explanation**

You tried to restart a process that dbx cannot restart.

# **User response**

Enter the subcommand only on the initial process.

FDBX0721

Operation not valid in dump processing mode.

# **Explanation**

The dbx subcommand entered can only be used when a live program is running.

### **User response:**

None.

**FDBX0722** 

BPXGMPTR ASID SET error: string, retc=number, retsn=hex-number

# **Explanation**

dbx called the dump processing service BPXGMPTR or BPXGMPT4 to set an ASID which failed.

# **User response**

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0723** 

BPXGMPTR ASID LIST error: string, retc=number, retsn=hex-number

# **Explanation**

dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get a list of ASIDs in the dump which failed.

### User response

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0724** 

BPXGMPTR PID SET error: string, retc=number, retsn=hex-number

# **Explanation**

dbx called the dump processing service BPXGMPTR or BPXGMPT4 to set a PID which failed.

# User response

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0725** 

BPXGMPTR PID LIST error: string, retc=number, retsn=hex-number

dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get a list of PIDs in the dump which failed.

# **User response**

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0726** 

BPXGMPTR LDRINFO error: string, retc=number, retsn=hex-number

# **Explanation**

dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get the load map in the dump which failed.

# User response

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0727** 

BPXGMPTR CAPTURE error:number, retc=number, retsn=hex-number, addr=hex-number, nbytes=number

# **Explanation**

dbx called the dump processing service BPXGMPTR or BPXGMPT4 to capture storage in the dump which then failed.

# **User response**

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

FDBX0729

BPXGMPTR READ\_D error:number, retc=number, retsn=hex-number, addr=hex-number, nbytes=number

# **Explanation:**

dbx called the dump processing service BPXGMPTR or BPXGMPT4 to read storage in the dump which failed

#### **User response:**

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0730** 

Illegal use of subarrays.

### **Explanation:**

The index operator ".." cannot be used in this expression.

# **User response:**

Reenter the command specifying a correct array name.

# **FDBX0731**

**BPXGMPTR CONDINFO** error: number, retc=number, retsn=*hex-number* 

### **Explanation:**

dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get error information from the dump which failed.

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0732** 

interrupt code=hex-number, abend code=hex-number, abend reason code=hex-number, instruction length=hex-number

### **Explanation:**

Informational message that lists some of the error information that dbx obtained from the dump.

### **User response:**

None.

**FDBX0733** 

BPXGMPTR THREAD\_LIST error: number, retc=number, retsn=hex-number

# **Explanation:**

dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get the thread list from the dump which failed.

### **User response:**

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0734** 

BPXGMPTR THREAD\_CURRENT\_SET error: number, retc=number, retsn=hex-number retsn=hex-number

# **Explanation:**

dbx called the dump processing service BPXGMPTR or BPXGMPT4 to set the current thread from the dump which failed.

### **User response:**

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0735** 

BPXGMPTR THREAD\_CURRENT\_SET error: number, retc=number, retsn=hex-number retsn=hex-number

# **Explanation:**

dbx called the dump processing service BPXGMPTR or BPXGMPT4 to set the current thread in the dump which failed.

### **User response:**

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0736** 

BPXGMPTR GPR\_LIST error: number, retc=number, retsn=hex-number

#### **Explanation:**

dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get the general registers in the dump which failed.

#### **User response:**

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0737** 

BPXGMPTR PSW error: number, retc=number, retsn=hex-number

### **Explanation:**

dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get the PSW in the dump which failed.

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0738** 

BPXGMCDE close failure: number

#### **Explanation:**

dbx called the dump processing service BPXGMCDE or BPXGMCD4 to close the dump which failed.

### **User response:**

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

### **FDBX0739**

#### **BPXGMCDE** return buffer:

### **Explanation:**

The following error messages came from the BPXGMCDE or BPXGMCD4 dump service up to the next FDBXxxxx message.

### **User response:**

Record the error messages for problem determination.

**FDBX0740** 

BPXGMCDE open error: ret1=2

#### **Explanation:**

dbx called the dump processing service BPXGMCDE or BPXGMCD4 to open the dump which failed.

### **User response:**

Follow local procedures for reporting problems.

#### FDBX0741

BPXGMCDE open failure: rc=number, ret1=hex-number, ret2=hex-number, ret3=hex-number

### **Explanation:**

dbx called the dump processing service BPXGMCDE or BPXGMCD4 to open the dump which failed.

# **User response:**

Follow local procedures for reporting problems.

### **FDBX0742**

Interrupt during dump open. Do you want to continue? (Y/N):

### **Explanation:**

The user pressed control-C while dbx was waiting for the BPXGMCDE (or BPXGMCD4) OPEN request to complete.

### **User response:**

Enter Y to continue waiting for the OPEN to complete, or enter N to terminate dbx and return to the shell.

# **FDBX0743**

# Cleaning up and exiting by user request

#### **Explanation:**

The user pressed control-c, then answered Y to the FDBX0742 message, so dbx is closing the dump service and will exit.

# **User response:**

None.

#### **FDBX0744**

### Thread information is not complete in this dump

### **Explanation:**

The kernel service returned incomplete thread information from the dump. The display of thread information from the dump may have some incorrect values.

# **User response:**

Follow local procedures for reporting problems.

### **FDBX0748**

could not load BPXGMCDE

### **Explanation:**

dbx could not load the dump services initialization module.

### **User response:**

Follow local procedures for reporting problems.

### **FDBX0749**

#### could not load BPXGMPTR

### **Explanation:**

dbx could not load the dump services processing module.

### **User response:**

Follow local procedures for reporting problems.

### **FDBX0750**

### Initializing dump dump-name. This may take a while...

### **Explanation:**

dbx is calling the dump services routine to initialize the dump.

### **User response:**

None.

### FDBX0751

# BPXGMCDE token=hex-number, release=number, level=number

# **Explanation:**

Informational message showing the version information of the dump processing service.

#### **User response:**

None.

### **FDBX0752**

### **BPXGMCDE Starting the TSO environment**

# **Explanation:**

Informational message showing the dump initialization progress.

#### **User response:**

None.

### FDBX0753

### **BPXGMCDE BPXTIPCS started**

#### **Explanation:**

Informational message showing the dump initialization progress.

# **User response:**

None.

### **FDBX0754**

# **BPXGMCDE BPXTIPCS allocating CLIST data set**

# **Explanation:**

Informational message showing the dump initialization progress.

#### **User response:**

None.

### **FDBX0755**

### BPXGMCDE BPXTIPCS allocating dump directory via BLSCDDIR

### **Explanation:**

Informational message showing the dump initialization progress.

### **User response:**

None.

### **FDBX0756**

# BPXGMCDE BPXTIPCS allocating the dump data set

### **Explanation:**

Informational message showing the dump initialization progress.

### **User response:**

None.

### **FDBX0757**

**BPXGMCDE BPXTIPCS invoking IPCS** 

Informational message showing the dump initialization progress.

**User response:** 

None.

**FDBX0758** 

**BPXGMCDE BPXTIPC2 invoking VERBX** 

**Explanation:** 

Informational message showing the dump initialization progress.

**User response:** 

None.

**FDBX0759** 

**BPXGMCDE Dump analysis started** 

**Explanation:** 

Informational message showing the dump initialization progress.

**User response:** 

None.

**FDBX0760** 

BPXGMCDE Dump analysis processing ASIDs: number of number

**Explanation:** 

Informational message showing the dump initialization progress.

**User response:** 

None.

**FDBX0761** 

**BPXGMCDE BPXTIPCS exiting** 

**Explanation:** 

Informational message showing the dump initialization progress.

**User response:** 

None.

**FDBX0762** 

Using ASID=hex-number

**Explanation:** 

Informational message showing the ASID where dump services found the program error.

**User response:** 

None.

**FDBX0763** 

Using PID=number

**Explanation:** 

Informational message showing the PID where dump services found the program error.

**User response:** 

None.

**FDBX0765** 

BPXGMPTR FPR\_LIST error: number, retc=number, retsn=hex-number

**Explanation:** 

dbx called the dump processing service BPXGMPTR or BPXGMPT4 to get the floating point registers from the dump which failed.

# **User response**

Set the \_DBX\_GCORELOGDSN environment variable to point to an MVS sequential data set and rerun dbx to generate a log of the error that contains the kernel service information. Follow local procedures for reporting problems.

**FDBX0766** 

Abend ASID=hexnum not equal home ASID=hexnum

**Explanation:** 

The abend in the core file occurred in a different address space. We have to switch to the abend address space for continued processing.

### **User response:**

None.

#### **FDBX0767**

### operation only valid in dump processing mode

### **Explanation:**

This operation is only valid when processing a core file.

### **User response:**

Specify a different operation, or restart dbx in core processing mode.

### **FDBX0768**

# fopen for IPCS print data set string failed

# **Explanation**

dbx was unable to open the specified dataset

# User response

Specify the correct dataset.

### **FDBX0769**

# popen for system pager "string" failed

# **Explanation:**

dbx was unable to open the system pager for output processing.

#### **User response:**

Ensure that the PAGER environment variable is set correctly.

#### **FDBX0770**

# The execution registers are in ASID=hex-number and are not available

### **Explanation:**

No execution registers are available in the dump. dbx will only be able to display dump storage information.

### **User response:**

Proceed with dump analysis in this reduced mode, or replace the dump with one that contains the execution registers.

# **FDBX0771**

BPXGMCDE BPXTIPCS is recalling a migrated MVS dataset. This may take a while

### **Explanation:**

A dataset needed by IPCS was migrated. The dataset must be recalled

### **User response:**

Wait until IPCS finishes the recall operation.

### **FDBX0806**

### Usage: command { on | off | parent | child }

#### **Explanation:**

You tried to use an option other than on, off, parent, or child for the subcommand.

### **User response:**

Reenter the subcommand and specify a valid option.

#### **FDBX0810**

### open failure on recording file

### **Explanation:**

dbx could not open the file specified on the record subcommand.

#### **User response:**

Reenter the record subcommand with a different file name. Follow local procedures for reporting problems.

#### FDBX0811

### write failure on recording file

### **Explanation:**

910 z/OS: z/OS UNIX System Services Messages and Codes

dbx could not write to the file specified on the record subcommand.

#### **User response:**

Verify permissions to the record file. Follow local procedures for reporting problems.

### FDBX0813

recording already active

### **Explanation:**

dbx cannot process a new record filename until the current record is closed.

### **User response:**

Enter record to close the current record session, then reenter record with a filename to open the new record session.

#### **FDBX0815**

Argument count=number

### **Explanation:**

The argument count that will be passed to the user's program.

### **User response:**

None.

### **FDBX0816**

**Arguments** 

#### **Explanation:**

The list of arguments follows that will be passed to the user's program.

### **User response:**

None.

# **FDBX0817**

cannot unset "debugger\_variable"

### **Explanation:**

The debugger variable listed in the message cannot be undefined.

# **User response**

Specify a different subcommand.

#### **FDBX0818**

"debugger\_variable" must be an integer.

#### **Explanation:**

The debugger variable listed may only be assigned an integer value.

# **User response**

Rerun the subcommand with an integer value.

# FDBX0820

\$fl precision must be 4, 8, or 16

### **Explanation:**

The user tried to set the \$fl\_precision debugger variable to an invalid value.

# User response

Retry the operation specifying a valid value.

# FDBX0821

\$r\_precision must be 4 or 8

# **Explanation:**

The user tried to set the \$r\_precision debugger variable to an invalid value.

# **User response**

Retry the operation specifying a valid value.

# When \$fl\_precision is 16, floating point registers may only be referenced via an even based pair of flregs (i.e. \$fr0, \$frb2)

# **Explanation**

The user tried to assign or print a value to an odd floating point register when \$fl\_precision was 16. The register pair must start with an even floating point register in this case.

#### **User response:**

Respecify the command with an even floating point register.

### **FDBX0823**

number is out of range 0..number

### **Explanation:**

The vector register index is out of range.

# **User response:**

Reenter the **print** subcommand with a valid index.

#### **FDBX0824**

### **Invalid vector register type**

### **Explanation:**

An invalid type was specified when an attempt was made to access vector registers.

#### **User response:**

Use a valid register type such as integers, characters, and shorts.

#### **FDBX0826**

Attempt to read or write vector registers but the Vector Extension Facility is not available

### **Explanation:**

An attempt was made to read or write to the vector registers but the Vector Extension Facility was not available.

#### **User response:**

Retry the operation on a system that has the Vector Extension Facility installed.

FDBX0840

Usage: mutex [wait | nowait | lock | unlock | number]

### **Explanation:**

Usage info for the mutex subcommand.

### **User response:**

None.

### FDBX0841

Usage: condition [wait | nowait | number]

### **Explanation:**

Usage info for the condition subcommand.

#### **User response:**

None.

# FDBX0843

Usage: thread [hold | unhold | info | current | activ | async | dead | pcanc ] [thread#]

#### **Explanation:**

Usage info for the thread subcommand.

### **User response:**

None.

### **FDBX0846**

number is not an existing thread.

# **Explanation:**

The user has attempted to switch to or run\_next a nonexisting thread.

### **User response:**

Reenter the subcommand with an existing thread. Use the thread subcommand to display all threads.

no thread available

**Explanation:** 

The user has attempted to operate on thread when thread library is not loaded.

**FDBX0848** 

ptrace(PT\_THREAD\_READ\_FOCUS) error, errno=number

**Explanation:** 

The ptrace() function call returned a -1 with the errno stating the error.

# **User response**

Retry the subcommand or operation.

**FDBX0849** 

ptrace(PT\_THREAD\_SIGNAL) error, errno=number

**Explanation:** 

The ptrace() function call returned a -1 with the errno stating the error.

# **User response**

Retry the subcommand or operation.

FDBX0850

ptrace(PT\_THREAD\_WRITE\_FOCUS) error, errno=number

**Explanation:** 

The ptrace() function call returned a -1 with the errno stating the error.

# **User response**

Retry the subcommand or operation.

FDBX0851

ptrace(PT\_THREAD\_HOLD) error, errno=number

**Explanation:** 

The ptrace() function call returned a -1 with the errno stating the error.

# **User response**

Retry the subcommand or operation.

FDBX0852

**Get information failure** 

**Explanation:** 

Could not allocate storage to hold the thread information control block.

**User response:** 

Verify amount and reenter the dbx command.

FDBX0853

Thread must have state 'activ'

**Explanation:** 

The subcommand you specified must have the thread in state 'activ'.

**User response:** 

Reenter the subcommand specifying a thread that is in state 'activ'.

**FDBX0854** 

ptrace(PT\_THREAD\_MODIFY) error, errno=number

**Explanation:** 

The ptrace() function call returned a -1 with the errno stating the error.

# **User response**

Retry the subcommand or operation.

# ptrace(PT\_EXPLAIN) error, errno=number

### **Explanation:**

The ptrace() function call returned a -1 with the errno stating the error.

# **User response**

Retry the subcommand or operation.

#### **FDBX0856**

# Stopped due to program load

#### **Explanation:**

dbx processing has stopped due to the debuggee loading a DLL, and the \$dll\_loadstop debugger variable being set.

### **User response:**

Continue the debugging session normally. Unset the \$dll\_loadstop debugger variable to suspend this notification message.

### **FDBX0857**

### Stopped due to program unload

### **Explanation:**

dbx processing has stopped due to the debuggee unloading a DLL, and the \$dll\_loadstop debugger variable being set.

### **User response:**

Continue the debugging session normally. Unset the \$dll\_loadstop debugger variable to suspend this notification message.

#### FDBX0858

### Stopped due to exec with multiprocessing enabled.

### **Explanation:**

dbx processing has stopped due to the debuggee exec'ing and multproc being enabled.

#### **User response:**

Continue the debugging session normally. Disable the multproc setting to suspend this notification message.

### FDBX0860

### number is not an existing condition variable.

# **Explanation:**

The user has attempted to display a nonexisting condition variable.

#### **User response:**

Reenter the subcommand with an existing condition variable. Use the condition subcommand to display all condition variables.

# FDBX0861

### number is not an existing mutex.

#### **Explanation:**

The user has attempted to display a nonexisting mutex.

# **User response:**

Reenter the subcommand with an existing mutex. Use the mutex subcommand to display all mutexes.

### FDBX0862

### event id removed because object no longer exists

#### **Explanation:**

A conditional breakpoint was set for a specific object that no longer exists. This event was removed from the event processing queue. The status subcommand will show the event is removed.

# **User response:**

None.

### FDBX0863

### changed from string to string on event number

#### **Explanation:**

A conditional breakpoint was set for a specific object that has been changed. The status subcommand will show the event has been changed.

**User response:** 

None.

FDBX0864 Usage: "thread current" takes zero or one id.

**Explanation:** 

Usage info for the thread subcommand.

**User response:** 

None.

FDBX0865 Usage: "mutex { wait | nowait | lock | unlock }" takes no id.

**Explanation:** 

Usage info for the mutex subcommand.

**User response:** 

None.

FDBX0866 Usage: condition "{ wait | nowait }" takes no id.

**Explanation:** 

Usage info for the condition subcommand.

**User response:** 

None.

FDBX0868 Could not allocate storage, size was number

**Explanation:** 

dbx could not obtain storage.

**User response:** 

Increase the size of your address space.

FDBX0938 IPT create, thid=thread-id, stack=number

**Explanation:** 

dbx informational message that results from \$tv\_events trace events.

**User response:** 

None.

FDBX0939 IPT exit, thid=thread-id

**Explanation:** 

dbx informational message that results from \$tv\_events trace events.

**User response:** 

None.

FDBX0940 tv create, thid=thread-id, created thid=thread-id stack=number

**Explanation:** 

dbx informational message that results from \$tv\_events trace events.

**User response:** 

None.

FDBX0941 tv created, thid=thread-id, stack=number

**Explanation:** 

dbx informational message that results from \$tv\_events trace events.

**User response:** 

None.

FDBX0942 tv exit, thid=thread-id

**Explanation:** 

dbx informational message that results from \$tv\_events trace events.

**User response:** 

None.

**FDBX0943** 

tv wait, thid=thread-id, joining thid=thread-id

**Explanation:** 

dbx informational message that results from \$tv\_events trace events.

**User response:** 

None.

**FDBX0944** 

tv unwait, thid=thread-id, joined thid=thread-id

**Explanation:** 

dbx informational message that results from \$tv\_events trace events.

**User response:** 

None.

**FDBX0945** 

mv initialize, object=object-address

**Explanation:** 

dbx informational message that results from \$mv\_events trace events.

**User response:** 

None.

**FDBX0946** 

mv destroy, object=object-address

**Explanation:** 

dbx informational message that results from \$mv\_events trace events.

**User response:** 

None.

**FDBX0947** 

mv lock, object=object-address, thid=thread-id

**Explanation:** 

dbx informational message that results from \$mv\_events trace events.

**User response:** 

None.

**FDBX0948** 

mv wait, object=object-address, this=thread-id

**Explanation:** 

dbx informational message that results from \$mv\_events trace events.

**User response:** 

None.

**FDBX0949** 

mv unlock, object=object-address, thid=thread-id

**Explanation:** 

dbx informational message that results from \$mv\_events trace events.

**User response:** 

None.

**FDBX0950** 

mv unwait, object=object-address, thid=thread-id

**Explanation:** 

dbx informational message that results from \$mv\_events trace events.

**User response:** 

None.

FDBX0951

mv relock, object=object-address, thid=thread-id

**Explanation:** 

dbx informational message that results from \$mv\_events trace events.

916 z/OS: z/OS UNIX System Services Messages and Codes

**User response:** 

None.

FDBX0952

mv unrelock, object=object-address, thid=thread-id

**Explanation:** 

dbx informational message that results from \$mv\_events trace events.

**User response:** 

None.

FDBX0953

cv initialize, object=object-address

**Explanation:** 

dbx informational message that results from \$cv\_events trace events.

**User response:** 

None.

**FDBX0954** 

cv destroy, object=object-address

**Explanation:** 

dbx informational message that results form \$cv\_events trace events.

**User response:** 

None.

**FDBX0955** 

cv wait, object=address, mutex=address, thid=thread-id

**Explanation:** 

dbx informational message that results from \$cv\_events trace events.

**User response:** 

None.

**FDBX0956** 

cv wait, object=address, mutex=address, thid=thread-id

**Explanation:** 

dbx informational message that results from \$cv\_events trace events.

**User response:** 

None.

**FDBX0957** 

Duplicate module-name found at *hex-number* and *hex-number*, ignoring version at *hex-number* 

**Explanation:** 

dbx detected a more than one load module in the loadmap with the same name. For symbolic purposes, dbx uses the loadmodule with the lower address and ignores the others of the same name.

# **User response**

Relink the DLL/load module specifying the reentrant attribute. Follow local procedures for reporting problems.

**FDBX0960** 

Creating actual event from onload event [id]

**Explanation:** 

A line number or function specified as part of an onload event is now active due to a DLL load. dbx has created real stop/trace events from the onload event.

**User response:** 

None.

FDBX1001

Target \$charset specification must be IBM-1047

**Explanation:** 

dbx currently only supports IBM-1047 for the target charset.

Reenter the set \$charset command specifying the target charset as IBM-1047.

### FDBX1002

# **Invalid source \$charset specfication**

#### **Explanation:**

The \_\_toCcsid() returned an error with the source \$charset codeset specification.

#### **User response:**

Reenter the set \$charset command specifying a correct source codeset specification.

#### FDBX1003

# \$charset returned to default "IBM-1047,IBM-1047"

### **Explanation:**

dbx set the \$charset encoding back to the default.

# **User response**

None

#### **FDBX1018**

Storage access failed, target=hex-number, target alet=hex-number, source=hex-number, source alet=hex-number, size=hex-number

# **Explanation:**

dbx attempted to access storage that it could not read or write to.

# User response

Verify the source, target or size fields. Verify the symbol/value specified on the dbx subcommand that caused the error. Follow local procedures for reporting problems.

### FDBX1055

### rwl lock, object=object-address, thid=thread-id

### **Explanation:**

dbx informational message that results from \$lv\_events trace events.

#### **User response:**

None.

#### FDBX1056

rwl wait, object=object-address, thid=thread-id

### **Explanation:**

dbx informational message that results from \$lv events trace events.

#### **User response:**

None.

# **FDBX1057**

rwl unlock, object=object-address, thid=thread-id

### **Explanation:**

dbx informational message that results from \$lv\_events trace events.

#### **User response:**

None.

# **FDBX1058**

rwl unwait, object=object-address, thid=thread-id

#### **Explanation:**

dbx informational message that results from \$lv\_events trace events.

# **User response:**

None.

### FDBX1059

rwl relock, object=object-address, thid=thread-id

#### **Explanation:**

dbx informational message that results from \$lv\_events trace events.

None.

FDBX1060

rwl unrelock, object=object-address, thid=thread-id

**Explanation:** 

dbx informational message that results from \$lv\_events trace events.

**User response:** 

None.

FDBX1063

rwl initialize, object=object-address

**Explanation:** 

dbx informational message that results from \$lv\_events trace events.

**User response:** 

None.

FDBX1064

rwl destroy, object=object-address

**Explanation:** 

dbx informational message that results from \$lv\_events trace events.

**User response:** 

None.

FDBX1065

Usage: "readwritelock { wait | nowait | lock | unlock | share }" takes no id.

**Explanation:** 

Usage information for the readwritelock subcommand.

**User response:** 

None.

**FDBX1066** 

Usage: readwritelock [wait | nowait | lock | unlock | share | <readwritelock#>]

**Explanation:** 

Usage information for the readwritelock subcommand.

**User response:** 

None.

**FDBX1067** 

number is not an existing readwritelock.

**Explanation:** 

The user has attempted to display a nonexisting readwritelock.

**User response:** 

Reenter the subcommand with an existing readwritelock. Use the readwritelock display all readwritelocks.

**FDBX1100** 

plugin *name* loaded.

**Explanation:** 

dbx has loaded the user's plugin

**User response:** 

None.

FDBX1101

Plugin name missing export name is not loaded.

Explanation:

dbx could not find the required exported function from the plugin.

**User response:** 

Check the build of the plugin to verify that the specified function is exported from the plugin DLL.

FDBX1102

dbx\_plugin\_version() call in *filename* returned number when *number* or lower is required and is not loaded.

#### **Explanation:**

dbx called dbx\_plugin\_version() in the plugin which returned a higher version than this dbx suports.

### **User response:**

Check the dbx\_plugin\_version() function to be sure it returns a plugin version that is supported by this dbx.

### FDBX1103

dbx\_plugin\_session\_init() call in *filename* returned *number* and is not loaded.

# **Explanation:**

dbx called dbx plugin session init() in the plugin which returned a non-zero value.

#### **User response:**

Check the build of the plugin to verify that the specified function is exported from the plugin DLL.

### FDBX1104

plugin name unloaded.

### **Explanation:**

dbx has unloaded the user's plugin.

### **User response:**

None.

# FDBX1105

No plugin with name name is currently loaded.

### **Explanation:**

The plugin name specified on the pluginunload command is not currently active.

### **User response:**

Reenter the pluginunload command specifying a plugin that has been previously loaded.

#### FDBX1106

No plugin with name name could be found.

#### **Explanation:**

No plugin of the specified name could be found in the plugin path or the path of the main module.

# **User response**

Verify that there is a plugin with a name that can be found with name matching the regular expression ^libdbx\_.+ \.dll\$ in the main module's path or in the path list specified by \_DBX\_PLUGIN\_PATH.

#### **FDBX1107**

Plugin *name* callback operation received signal *signal-number* and was terminated.

### **Explanation:**

dbx called a callback routine in a plugin which caused a signal. This is probably a programming error in the callback routine in the plugin.

# **User response**

Compile the plugin DLL with '-Wc,debug' and run a dbx that does not load the plugin on a dbx that does load the plugin. The first dbx will be able to do source level debug of the plugin that is running in the second dbx.

# FDBX1108

Plugin with name name is not currently loaded.

#### **Explanation:**

The plugin name specified has not been loaded.

### **User response:**

Reissue the plugin subcommand with a plugin that has been loaded.

### FDBX1109

Plugin with name name is has already been loaded.

#### **Explanation:**

A plugin with the specified name has already been loaded.

Specify the pluginload subcommand with the name of a plugin that has not been loaded yet. Verify multiple plugins with the same name do not exist in the plugin load path.

FDBX1110

Plugin load of *plugin* failed: amode is *number* but dbx expects amode*number*.

#### **Explanation:**

dbx tried to load a plugin that has a different AMODE than it expected. If using dbx64, the plugin must be compiled amode64; dbx31 requires amode31 plugins.

#### **User response:**

Recompile plugin so its AMODE matches dbx.

FDBX5000

Offset ofs exceeds buffer size buffer\_size.

### **Explanation:**

An internal dbx read buffer error occurred.

### **User response:**

Follow local procedures for reporting problems.

FDBX5001

Attempted to read *datalen* bytes but the buffer only contains *datalen* bytes.

#### **Explanation:**

An internal dbx read buffer error occurred.

### **User response:**

Follow local procedures for reporting problems.

FDBX5002 Internal Error: RC=return code.

### **Explanation:**

An internal dbx error occurred.

# **User response:**

Follow local procedures for reporting problems.

FDBX5003 Internal Error: send(socket, \*, length, 0) failed.

### **Explanation:**

An internal dbx communications error occurred.

### **User response:**

Follow local procedures for reporting problems.

FDBX5004 Unable to create socket stream.

### **Explanation:**

An internal dbx communications error occurred.

#### **User response:**

Follow local procedures for reporting problems.

FDBX5005 The connection was refused.

# **Explanation:**

dbx was unable to connect to the remote debugger.

### **User response:**

Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

FDBX5006 Interrupt during remote debugger processing. Cleaning up and exiting dbx.

### **Explanation:**

dbx received a SIGINT, so it will clean up and exit.

None.

### FDBX5010

Fatal error in remote debugger processing: rc=return code.

#### **Explanation:**

A fatal error occurred in remote debugger processing.

### **User response:**

Check command line parameters and network connections. Try the application again when the problem has been corrected.

# FDBX5011

Could not resolve network address 'address'

#### **Explanation:**

The -p commandline option was specified, but a valid hostname or IP address to connect to was not supplied, or a valid hostname was supplied and the DNS server was unable to resolve it to an IP address.

### **User response:**

Reenter the dbx command with a valid hostname or IP address as part of the -p option.

#### FDBX5012

No executable program specified.

### **Explanation:**

The -p commandline option was specified but the name of the program to be debugged was not supplied.

### **User response:**

Reenter the dbx command including the name of an executable file.

### FDBX5013

Communications Error: function-name-or-description; errno=number: error-description

### **Explanation:**

An error occurred during communications processing.

### **User response:**

Follow local procedures for reporting problems.

### **FDBX5014**

Received packet with indicated size of size - max size is max size."

#### **Explanation:**

dbx received a request packet with a potentially invalid size.

#### **User response:**

Follow local procedures for reporting problems.

# FDBX5015

Tried to write to offset num, which is larger than max offset num.

# **Explanation:**

dbx tried to create a very large reply packet, and the internal size limiter was triggered.

#### **User response:**

Follow local procedures for reporting problems.

# **FDBX5016**

Could not execute specified program.

### **Explanation:**

dbx was unable to execute the program in order to begin debugging it.

# **User response:**

Ensure that the program name is valid, and is actually an executable program. Try running the program outside dbx to see if it can run without problems. If you still encounter problems, contact your system administrator.

### **FDBX5017**

Unable to read data from specified socket.

### **Explanation:**

dbx is unable to communicate with the remote debugger.

Ensure that the specified hostname or IP address is correct for the intended remote debugger machine. If this is not the case, please start the remote debugger. Otherwise, report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

FDBX5019

Function or entry point name not found.

**Explanation:** 

The name specified by a find function or entry point request was not found.

**User response:** 

Specify a valid function or entry point name.

FDBX5021 Internal Error: Invalid EntryID entryID in request code request code.

**Explanation:** 

An internal dbx error occurred.

**User response:** 

Follow local procedures for reporting problems.

FDBX5022 Internal Error: Invalid DU DU in request code request code.

**Explanation:** 

An internal dbx stack error occurred.

**User response:** 

Follow local procedures for reporting problems.

FDBX5023 Internal Error: Invalid StackEntryNum stαckEntryNum in request code request code.

**Explanation:** 

An internal dbx stack error occurred.

**User response:** 

Follow local procedures for reporting problems.

FDBX5024 Internal Error: Cannot continue execution.

**Explanation:** 

An internal dbx execution error occurred.

**User response:** 

Follow local procedures for reporting problems.

FDBX5025 Internal Error: Unable to use partName in request code request code.

**Explanation** 

An internal dbx error occurred.

**User response:** 

Follow local procedures for reporting problems.

FDBX5026 expression is not defined

**Explanation:** 

The user specified an invalid expression. This expression cannot be monitored by dbx.

**User response** 

Specify a valid expression.

FDBX5027 Internal Error: Breakpoint event *number* could not be removed.

**Explanation:** 

An internal dbx breakpoint error occurred.

**User response:** 

Follow local procedures for reporting problems.

FDBX5030 Internal Error: Breakpoint request code request code is not supported.

**Explanation:** 

An internal dbx breakpoint error occurred.

**User response:** 

Follow local procedures for reporting problems.

FDBX5035

Internal Error: Breakpoint type *type* in request code *request code* is not supported.

**Explanation:** 

An internal dbx breakpoint error occurred.

**User response:** 

Follow local procedures for reporting problems.

**FDBX5036** 

Internal Error: Breakpoint type type in request code request code is not supported.

**Explanation:** 

An internal dbx breakpoint error occurred.

**User response:** 

Follow local procedures for reporting problems.

**FDBX5037** 

Internal Error: Disabled breakpoints are not supported.

**Explanation:** 

An internal dbx breakpoint error occurred.

**User response:** 

Follow local procedures for reporting problems.

FDBX5038

Internal Error: Breakpoint skipping is not supported.

**Explanation:** 

An internal dbx breakpoint error occurred.

**User response:** 

Follow local procedures for reporting problems.

FDBX5039

Internal Error: Breakpoint conditional expressions are not supported.

**Explanation:** 

An internal dbx breakpoint error occurred.

**User response:** 

Follow local procedures for reporting problems.

**FDBX5040** 

Internal Error: Breakpoint thread filtering is not supported.

**Explanation:** 

An internal dbx breakpoint error occurred.

**User response:** 

Follow local procedures for reporting problems.

FDBX5041

Internal Error: Breakpoint replacement is not supported.

**Explanation:** 

An internal dbx breakpoint error occurred.

**User response:** 

Follow local procedures for reporting problems.

FDBX5042

Internal Error: Statement number breakpoints are not supported.

**Explanation:** 

924 z/OS: z/OS UNIX System Services Messages and Codes

An internal dbx breakpoint error occurred.

### **User response:**

Follow local procedures for reporting problems.

FDBX5043

Internal Error: Entry breakpoints must be case sensitive.

### **Explanation:**

An internal dbx breakpoint error occurred.

### **User response:**

Follow local procedures for reporting problems.

FDBX5044

Internal Error: Breakpoint for entry point *entry point* could not be created.

### **Explanation:**

An internal dbx breakpoint error occurred.

### **User response:**

Follow local procedures for reporting problems.

FDBX5045

Internal Error: Missing entry information in request code request code.

### **Explanation:**

An internal dbx breakpoint error occurred.

#### **User response:**

Follow local procedures for reporting problems.

**FDBX5047** 

Internal Error: Invalid breakpoint request type.

### **Explanation:**

An internal dbx breakpoint error occurred.

### **User response:**

Follow local procedures for reporting problems.

### **FDBX5048**

Internal Error: Breakpoint for line *line number* could not be created.

#### **Explanation:**

An internal dbx breakpoint error occurred.

### **User response:**

Follow local procedures for reporting problems.

### FDBX5049

Internal Error: Invalid expression ID *expression ID* in request code request code.

#### **Explanation:**

An internal dbx error occurred.

#### **User response:**

Follow local procedures for reporting problems.

### FDBX5050

Unable to modify expression value.

### **Explanation:**

The expression could not be set to the value entered.

### **User response**

Check the value entered and ensure that the value is appropriate for the type of the expression, and that character and string values are properly delimited with quotes or double quotes, respectively.

### FDBX5051

Internal Error: Invalid data type for request code request code.

### **Explanation:**

An internal dbx error occurred.

### **User response:**

Follow local procedures for reporting problems.

### FDBX5052

Internal Error: Unable to display all elements for request code request code.

#### **Explanation:**

An internal dbx error occurred.

### **User response:**

Follow local procedures for reporting problems.

#### FDBX5053

No global variables found.

### **Explanation:**

There are no global variables defined.

#### **User response:**

None.

#### **FDBX5054**

Internal Error: RC=return code for request code request code.

### **Explanation:**

An internal dbx error occurred.

### **User response:**

Follow local procedures for reporting problems.

### FDBX5055

Internal Error: Invalid part ID part ID in request code request code.

### **Explanation:**

An internal dbx error occurred.

### **User response:**

Follow local procedures for reporting problems.

### **FDBX5056**

The breakpoint for entry point entry point could not be created.

#### **Explanation:**

The debugger could not set the breakpoint on the specified entry point. It might have been removed, for example, for program optimization.

### **User response:**

Try choosing an entry point that is not likely to be optimized, or recompile the program without optimization.

#### **FDBX5400**

Cannot evaluate string.

### **Explanation:**

You either specified a *string* that cannot be evaluated because there is no method to evaluate a *string* of this type, or you are attempting to typecast with the parameters specified incorrectly.

#### **User response:**

Reenter the failing expression.

### FDBX5401

The value of string cannot be changed.

### **Explanation:**

You tried to change the value of string which is not user modifiable.

### **User response:**

Specify a different parameter to change.

## FDBX5402

Internal Error: Invalid parameters for request code request code.

### **Explanation:**

An internal dbx error occurred.

### **User response:**

Follow local procedures for reporting problems.

Internal Error: dpi\_command execution failure: "command".

### **Explanation:**

An error occurred during dpi\_command processing.

### **User response:**

Follow local procedures for reporting problems.

**FDBX5404** 

Internal Error: Source file can not be found due to bad part ID.

#### **Explanation:**

dbx received a bad part ID that does not match up with any known source files.

### **User response:**

Follow local procedures for reporting problems.

**FDBX5405** 

Internal Error: Could not open source file "filename."

### **Explanation:**

dbx was unable to open the source file for processing.

### **User response:**

Follow local procedures for reporting problems.

**FDBX5406** 

String not found.

#### **Explanation:**

The search string specified could not be found in the source part.

### **User response**

Enter a different search string.

FDBX5410

Internal Error: Command is null or too long.

#### **Explanation:**

The command string specified is either null or exceeds the maximum command length (1024 characters).

#### **User response:**

Follow local procedures for reporting problems.

FDBX5411

Unable to process requested command: "command string."

### **Explanation:**

You specified a command that is not a subcommand or user alias.

### **User response:**

Use the help subcommand to list the valid subcommands.

FDBX5412

Internal Error: Invalid action action in request code request code.

### **Explanation:**

An internal dbx error occurred.

### **User response:**

Follow local procedures for reporting problems.

FDBX5413

Internal Error: Could not attach to process process\_id

### **Explanation:**

An internal dbx error occurred.

### **User response:**

Follow local procedures for reporting problems.

#### **FDBX5414**

**Expression not specific.** 

### **Explanation:**

The module name for a load breakpoint or the watch expression for a change address breakpoint is null.

### **User response:**

Follow local procedures for reporting problems.

**FDBX5415** 

Internal Error: Breakpoint for address \"%s\" could not be created.

### **Explanation:**

Address breakpoint contains an invalid address.

### **User response:**

Specify a valid breakpoint address.

**FDBX5416** 

Internal Error: Could not change the source file text for disassembly view.

### **Explanation:**

An internal dbx error occurred.

#### **User response:**

Follow local procedures for reporting problems.

**FDBX5417** 

Internal Error: Unknown program stop condition with LastExecutionValue [%d].

### **Explanation:**

An internal dbx error occurred.

#### **User response:**

Follow local procedures for reporting problems.

#### **FDBX5418**

The length of value string is %d, which exceeds the limit(%d).

### **Explanation:**

The register value entered is longer than the maximum value length (900 characters).

### **User response:**

Enter a value string with less than 900 characters.

**FDBX5419** 

Subcommand %s is not supported in socket mode and subsequent commands, if any, will not be executed.

### **Explanation**

The subcommand entered is not supported for the debug console (command log) in socket mode.

### **User response**

Enter a supported subcommand.

### FDBX5500

dbx received a request code of request code which is not supported.

### **Explanation**

The remote debugger sent dbx a request type that dbx does not support.

### **User response:**

Follow local procedures for reporting problems.

**FDBX6400** 

Ddpi error: function-name-or-description: error-description

### **Explanation**

An error occurred during Ddpi processing

#### **User response:**

Follow local procedures for reporting problems.

### FDBX6401

**Ddpi objects not initialized** 

### **Explanation**

Internal Ddpi data structures are not in a state usable for processing

### **User response:**

Follow local procedures for reporting problems.

### FDBX6402

Ddpi machinestate not valid

### **Explanation**

An error occurred during Ddpi MachineState processing

### **User response:**

Follow local procedures for reporting problems.

FDBX6403

**ASCII to EBCDIC conversion error:** error-description

### **Explanation**

An error occurred during iconv() conversion of ASCII text to EBCDIC

### **User response:**

Follow local procedures for reporting problems.

**FDBX6404** 

Dwarf error: function-name-or-description: error-description

### **Explanation**

An error occurred during Dwarf processing

### **User response:**

Follow local procedures for reporting problems.

**FDBX6405** 

Unable to open dwarf debug data file file-name: error-description

### **Explanation**

The specified file-name could not be opened

### **User response**

Specify the correct debug data file

**FDBX6406** 

Format overflows output buffer in function function-name

### **Explanation**

An error occurred during internal file output processing

### **User response:**

Follow local procedures for reporting problems.

FDBX6407

Error - libelfdwarf DLL version mismatch! dbx requires libelfdwarf version *number* The loaded DLL is version *number* 

### **Explanation**

The libelf DLL is backlevel and does not support the ELF API required by dbx.

### **User response**

Install the current version of the libelf DLL.

### Unable to locate debug data

### **Explanation**

No source of debug data was specified to dbx, or the source did not contain valid debug data.

### **User response**

Specify a valid source of debug data

#### FDBX6409

### Unable to find debug data file debug-data-filename

### **Explanation**

The debug data file generated by the compiler could not be found in any of the source directories

### **User response**

Regenerate the debug data file, or specify the source directory that contains it

### FDBX6411

### No debug data files match module module

### **Explanation**

the debug data does not match the module, probably the module source code has changed, or been recompiled with a different compiler or compiler options since the .dbg file was generated.

### **User response**

Regenerate the .dbg file(s) using the current .o file(s)

### FDBX6412

File debug-data-pathname does not contain debug data.

### **Explanation**

The contents of the file debug-data-pathname are not recognized by dbx as debug data.

### **User response**

Regenerate the debug-data-pathname file.

#### FDBX6413

### No debug data is available for pathname/filename

### **Explanation**

No file containing debug data was found. Debugging continues but in a degraded mode with no symbol or source code information.

### **User response**

If complete debugging information is required, generate a file containing debug information and make it available to dbx.

### FDBX6414

### Attempt to convert ISD debug data for file sourcefile unsuccessful

### **Explanation**

Dwarf debug data is not available for the load module, and either no ISD debug data was found, or the ISD data could not be converted to Dwarf format.

### **User response**

Recompile the source with the -g compiler option; optionally convert the ISD data in the .o files to .dbg side files. If the problem persists, follow local procedures for reporting problems.

### FDBX6415

### Converting ISD data to Dwarf format for sourcefilename

### **Explanation**

Dwarf debug data was not available for sourcefilename, and ISD data was available; the ISD data was converted to Dwarf. Debugging continues with the converted data.

### **User response**

None, information only.

#### FDBX6416

### Cannot assign new value to bitfield

### **Explanation**

An attempt to assign a new value to a bitfield object in the debugged process failed.

### **User response**

If the failing expression is valid, follow local procedures for reporting problems.

#### **FDBX6417**

### Node is not symbol when symbol is required

### **Explanation**

this is an internal dbx error

### **User response:**

Follow local procedures for reporting problems.

### FDBX6418

### Cannot dereference pointer to value-type value

### **Explanation**

An attempt to retrieve that value of an object from the debugged process failed.

### **User response**

If the failing expression is valid, follow local procedures for reporting problems.

### FDBX6419

### Subarray low index number is greater than high index number

### **Explanation**

A subarray expression in a print subcommand specifies indices that are invalid (for example, p array[1..0]).

### **User response**

Reenter the print subcommand with a valid range of subarray indices.

### FDBX6420

### O\_WHATIS, bad op: number

### **Explanation**

An O\_WHATIS node contained a bad operation.

### **User response:**

Follow local procedures for reporting problems.

FDBX6421

Loaded debug data from debug-data-pathname

### **Explanation**

dbx had loaded debug data from the file debug-data-pathname

### **User response**

None, information only

FDBX6422

Alet obtain failed, using ptrace I/O backup

### **Explanation**

dbx attempted to get the Alet of the debuggee via the ptrace kernel service which failed. See the previous FDBX0601 for information on why the kernel service failed. To allow debugging to continue, dbx will use ptrace for storage requests from/to the debuggee. This will degrade debugging performance.

### **User response**

Use local procedures for reporting errors.

FDBX6423

Could not resolve name of debug file for filename

### **Explanation**

dbx could not discover the name of the debug side file.

### **User response**

Ensure that the dbg side file is not corrupt.

FDBX6424

Attempt to convert ISD debug data failed

### **Explanation**

The conversion attempt for the ISD debug data failed.

FDBX6426

Loaded debug data from an unknown file

### **Explanation**

dbx had loaded debug data from a file that it does not know the name of

### User response

None, information only

FDBX6427

Error - libddpi DLL version mismatch! dbx requires libddpi version hexnumber The loaded DLL is version hex-number

### **Explanation**

The libddpi DLL is backlevel and does not support the DDPI API required by dbx.

### **User response**

Install the current version of the libddpi DLL.

### string List count in Context has gone negative.

### **Explanation**

An internal dbx error has occurred.

### **User response:**

Use local procedures for error reporting.

### FDBX6429

### Debug file filename does not match the debug target.

#### **Explanation:**

The debug file mentioned could not be loaded since it does not match the debug target. This is due to the internal checksum of the debug file differing from the one stored in the debug target.

### **User response:**

Regenerate the debug file from the program source, or supply the correct file somewhere in the dbx "use" path.

#### **FDBX6430**

### The current context has no blocks.

### **Explanation:**

The current context being processed has no blocks. This is a dbx internal error.

#### **User response:**

Use local procedures for error reporting.

### FDBX6431

### Invalid debug data format.

### **Explanation:**

The debug format of a compile unit is invalid and cannot be loaded.

### **User response:**

Ensure that your object files contain debug data in either the ISD or CDA debug formats.

### FDBX6432

### Processing load module pathname/filename

### **Explanation:**

dbx is loading the debug data for the specified program object.

### **User response:**

None - informational message only.

### FDBX6433

### Evaluation error: error text

### **Explanation:**

dbx encountered an error while performing an evaluation operation. The error text describes the problem.

#### **User response:**

Retry the evaluation operation with different parameters to avoid the error.

#### FDBX6434

### fopen failed - dbx has too many files open.

#### **Explanation:**

dbx tried to fopen a file, and failed since the system rejected its request for a file descriptor.

### **User response:**

Increase the number of file descriptors available via the OMVS MAXFILEPROC parameter. Example: From the MVS console, type the following command: setomvs MAXFILEPROC=2000

#### **FDBX6435**

### Cannot determine AMODE for process number

#### **Explanation:**

dbx queried the kernel for the AMODE of a given process, but the kernel returned an error code. This was probably due to the process failing to execute.

#### **User response:**

Use local procedures for error reporting.

### FDBX6436

Attempt to determine AMODE for an invalid process ID number.

#### **Explanation:**

dbx queried the kernel for the AMODE of a given process, but the process ID was bad.

### **User response:**

Use local procedures for error reporting.

#### FDBX6440

### Could not find required library name

### **Explanation:**

dbx was unable to load a required library.

#### **User response:**

Verify that dbx is installed correctly.

### FDBX6441

Version API for library name not found.

### **Explanation:**

dbx was unable to load a required library.

### **User response:**

Verify that dbx is installed correctly.

### FDBX6490

### expression requires integral operands

#### **Explanation:**

You tried a shift or bit operation on a nonintegral operand. The operands must be integral.

#### **User response:**

Reenter the subcommand and specify integral values for the operands.

### FDBX6491

### incompatible pointer types

### **Explanation:**

You tried a pointer arithmetic expression with incompatible pointer types.

#### **User response:**

Reenter the subcommand and specify compatible types (perhaps by adding type casts) for the operands.

### FDBX6492

#### pointer arithmetic expression error

#### **Explanation:**

You tried a pointer arithmetic expression that cannot be calculated.

### **User response:**

Reenter the subcommand and specify a valid expression.

### FDBX6493

### member selection operand left-operand is not class, struct, or union

### **Explanation:**

You tried a member selection operation (. or ->) in which the first operand is not a class, struct, or union type.

#### **User response:**

Reenter the subcommand and specify a valid expression.

### FDBX6499

CDA levels: ELF=elf\_build\_version, DWARF=dwarf\_build\_version, DDPI=ddpi\_build\_version

### **Explanation:**

At startup dbx displays the versions of the three debug data libraries

#### **User response:**

None, information only

### FDBX7001

internal error: function(): node contains data of type type2 instead of type type1.

### **Explanation:**

function() was invoked to retrieve data of type type1 from the specified node, however, the basetype of the node is set to type2.

### **User response:**

This is an internal error. Report this problem to IBM via the appropriate service channel.

### FDBX7002

internal error: basetype of Node is not defined.

### **Explanation:**

The basetype field of the specified node is not defined. This indicates that the nstackValue field for the node does not contain data.

### **User response:**

This is an internal error. Report this problem to IBM via the appropriate service channel.

#### FDBX7004

internal error: DW\_ATE basetype *hex-number* is not defined in *function*().

#### **Explanation:**

basetype *value* is not defined in function *function*().

### **User response:**

This is an internal error. Report this problem to IBM via the appropriate service channel.

#### FDBX7005

internal error: DW\_ATE\_IBM\_user\_type is not valid for function().

### **Explanation:**

basetype *value* is not valid for function *function*().

#### **User response:**

This is an internal error. Report this problem to IBM via the appropriate service channel.

#### **FDBX7006**

internal error: dwarf basetype basetype not supported by function().

#### **Explanation:**

The basetype basetype is not supported by the function function().

### **User response:**

This is an internal error. Report this problem to IBM via the appropriate service channel.

### FDBX8001

Cannot exec 'string', errno=number, errno2=hex-number

#### **Explanation:**

The dbx loader was not able to execute the dbx debugger engine.

#### **User response:**

Check the error code to find out the reason the execution failed. Ensure that the dbx files are in their correct locations. Follow local procedures for reporting problems.

### FDBX8002

Cannot run in 64-bit mode, as specified by '-m8' option.

### **Explanation:**

dbx is unable to run in 64-bit mode on this machine, as requested by the -m8 flag.

#### **User response:**

Use local procedures for error reporting.

### FDBX8003

Option '-mnumber' is not valid, specify '-m4', or '-m8'.

### **Explanation:**

The user specified an invalid dbx startup mode flag.

### **User response:**

Re-issue the dbx command with a valid startup flag.

### FDBX8005

Warning: setlocale failed.

### **Explanation:**

An attempt to set the locale failed.

### **User response:**

Follow local procedures for reporting problems.

### More than one "-a" or "-A" options specified; exiting.

### **Explanation:**

The user specified more than one process ID for dbx to attach to.

### **User response:**

Reissue the dbx command with only one process ID specified.

### FDBX8007

### Could not set environment variable.

### **Explanation:**

dbx tried to set an environment variable, and the system reported that there was insufficient space in the environment

#### **User response:**

Follow local procedures for reporting problems.

#### FDBX8008

### This is the dbx debugger.

#### **Explanation:**

dbx displayed its help message since the user specified the -h switch on the command line.

### **User response:**

Read the help message, and rerun dbx without the -h switch. For more information, type "help" from within dbx or consult the z/OS UNIX System Services Programming Tools book for more information.

#### FDBX8009

### Using dbx binary located at path

### **Explanation:**

The user specified a dbx executable at an alternate path.

#### **User response:**

None - informational only.

### FDBX9001

#### Not a terminal

#### **Explanation:**

The user enabled the \$commandedit feature and redirected the standard input stream. This prevents \$commandedit from functioning properly.

### **User response:**

Rerun dbx with either \$commandedit disabled or do not redirect the standard input stream.

### FDBX9002

### Unable to open file

#### **Explanation:**

The fopen system call for the terminal device failed.

### **User response:**

Use local procedures for error reporting.

### FDBX9003

### tcgetattr error *number*

### **Explanation:**

The togetattr system call returned an error code.

#### **User response:**

Use local procedures for error reporting.

### FDBX9004

### tcsetattr error *number*

### **Explanation:**

The tcsetattr system call returned an error code.

#### **User response:**

Use local procedures for error reporting.

The loaded module does not contain module map which may lead to bad performance. Suggest to use dbgld to create module map to the executable before debugging.

### **Explanation:**

Suggest user to use dbgld to generate module map to executable before debugging

### **User response:**

None - informational only.

#### FDBX9998

whereis local mode will only search symbol symbol in current CU and global lists. To list all symbol symbol, please use whereis -exhaustive symbol, but that will cause all debug data files to be load and performance will be degraded.

### **Explanation:**

Inform user whereis local mode will only search current CU.

### **User response:**

None - informational only.

# **Chapter 2. Return codes (errnos)**

Return codes, also known as *errnos*, are generated by the system in response to either an action or lack of action that has been detected. The following list provides a summary of the various z/OS UNIX return codes that users might receive. It is not a comprehensive list because the return codes are subject to change.

Decimal Value	Hex Value	Return Code	Description
1	0001	EDOM	Error in the domain.
2	0002	ERANGE	Result is too large.
111	006F	EACCES	Permission is denied.
112	0070	EAGAIN	The resource is temporarily unavailable.
113	0071	EBADF	The file descriptor is incorrect.
114	0072	EBUSY	The resource is busy.
115	0073	ECHILD	No child process exists.
116	0074	EDEADLK	A resource deadlock is avoided.
117	0075	EEXIST	The file exists.
118	0076	EFAULT	The address is incorrect.
119	0077	EFBIG	The file is too large.
120	0078	EINTR	A function call is interrupted.
121	0079	EINVAL	The parameter is incorrect.
122	007A	EIO	An I/O error occurred.
123	007B	EISDIR	The file specified is a directory.
124	007C	EMFILE	Too many files are open for this process.
125	007D	EMLINK	Too many links occurred.
126	007E	ENAMETOOLONG	The file name is too long.
127	007F	ENFILE	Too many files are open in the system.
128	0800	ENODEV	No such device exists.
129	0081	ENOENT	No such file, directory, or IPC member exists.
130	0082	ENOEXEC	The exec call contained a format error. The target module on an exec call was not a valid executable module. The additional reason codes provided are useful for internal debugging by IBM service representatives.
131	0083	ENOLCK	No locks are available.
132	0084	ENOMEM	Not enough space is available.
133	0085	ENOSPC	No space is left on the device, or no space is available to create the IPC member ID.
134	0086	ENOSYS	The function is not implemented.
135	0087	ENOTDIR	Not a directory.
136	8800	ENOTEMPTY	The directory is not empty.

Decimal Value	Hex Value	Return Code	Description
137	0089	ENOTTY	The I/O control operator is inappropriate.
138	A800	ENXIO	No such device or address exists.
139	008B	EPERM	The operation is not permitted.
140	008C	EPIPE	The pipe is broken.
141	008D	EROFS	The specified file system is read only.
142	008E	ESPIPE	The seek is incorrect.
143	008F	ESRCH	No such process or thread exists.
144	0090	EXDEV	A link to a file on another file system was attempted.
145	0091	E2BIG	The parameter list is too long, or the message to receive was too large for the buffer.
146	0092	ELOOP	A loop is encountered in symbolic links.
147	0093	EILSEQ	The byte sequence is illegal.
149	0095	EOVERFLOW	A value is too large to be stored in the data type.
150	0096	EMVSNOTUP	OpenMVS kernel is not active.
151	0097	EMVSDYNALC	Dynamic allocation error.
152	0098	EMVSCVAF	Common VTOC access facility (CVAF) error.
153	0099	EMVSCATLG	Catalog obtain error.
156	009C	EMVSINITIAL	Process Initialization error.
157	009D	EMVSERR	An environmental or internal error has occurred.
158	009E	EMVSPARM	Bad parameters were passed to the service.
159	009F	EMVSPFSFILE	A permanent file error was encountered.
162	00A2	EMVSPFSPERM	A system error was encountered.
163	00A3	EMVSSAFEXTRERR	SAF/RACF extract error.
164	00A4	EMVSSAF2ERR	SAF/RACF error.
167	00A7	EMVSNORTL	Access to the OpenMVS version of the C RTL is denied.
168	8A00	EMVSEXPIRE	The password for the specified resource has expired.
169	00A9	EMVSPASSWORD	The new password specified is not valid.
170	00AA	EMVSWLMERROR	A WLM service ended in error.
171	00AB	EMVSCPLERROR	A Coupling Facility service ended in error.
172	00AC	EMVSARMERROR	An ARM service ended in error.
247	00F7	ENOTSUP	Operation Not Supported in this situation
1002	03EA	EIBMSOCKOUTOFRANGE	Socket number assigned by client interface code (for socket() and accept()) is out of range.
1003	03EB	EIBMSOCKINUSE	Socket number assigned by client interface code is already in use.
1005	03ED	EOFFLOADboxERROR	Offload box error.
1006	03EE	EOFFLOADboxRESTART	Offload box restarted.
1007	03EF	EOFFLOADboxDOWN	Offload box down.

Decimal Value	Hex Value	Return Code	Description
1008	03F0	EIBMCONFLICT	Already a conflicting call outstanding on socket.
1009	03F1	EIBMCANCELLED	Request canceled via SOCKcallCANCEL request.
1011	03F3	EIBMBADTCPNAME	SetIbmOpt specified a name of a PFS that either was not configured or was not a Sockets PFS.
1100	044C	ENOTBLK	Block device required.
1101	044D	ETXTBSY	Text file busy.
1102	044E	EWOULDBLOCK	The descriptor is marked nonblocking, and the requested function cannot complete immediately.
1103	044F	EINPROGRESS	Operation now in progress.
1104	0450	EALREADY	Operation already in progress.
1105	0451	ENOTSOCK	Socket operation on a nonsocket.
1106	0452	EDESTADDRREQ	Destination address required.
1107	0453	EMSGSIZE	The message is too large to be sent all at once, as required.
1108	0454	EPROTOTYPE	The socket type is incorrect.
1109	0455	ENOPROTOOPT	Protocol or socket option not available.
1110	0456	EPROTONOSUPPORT	Protocol not supported.
1111	0457	ESOCKTNOSUPPORT	Socket type not supported.
1112	0458	EOPNOTSUPP	The referenced socket is not a type that supports the requested function.
1113	0459	EPFNOSUPPORT	Protocol family not supported.
1114	045A	EAFNOSUPPORT	The address family is not supported.
1115	045B	EADDRINUSE	The address is already in use.
1116	045C	EADDRNOTAVAIL	Cannot assign requested address.
1117	045D	ENETDOWN	Network is down.
1118	045E	ENETUNREACH	Network is unreachable.
1119	045F	ENETRESET	Network dropped connection on reset.
1120	0460	ECONNABORTED	Software caused connection abort.
1121	0461	ECONNRESET	Connection reset by peer.
1122	0462	ENOBUFS	Insufficient buffer space available.
1123	0463	EISCONN	The socket is already connected.
1124	0464	ENOTCONN	The socket is not connected.
1125	0465	ESHUTDOWN	Cannot send after socket shutdown.
1126	0466	ETOOMANYREFS	Too many references: cannot splice.
1127	0467	ETIMEDOUT	Connection timed out.
1128	0468	ECONNREFUSED	The attempt to connect was rejected.
1129	0469	EHOSTDOWN	Host is down.
1130	046A	EHOSTUNREACH	No route to host.

Decimal Value	Hex Value	Return Code	Description
1131	046B	EPROCLIM	Too many processes.
1132	046C	EUSERS	Too many users.
1133	046D	EDQUOT	Disc quota exceeded.
1134	046E	ESTALE	Stale file handle.
1135	046F	EREMOTE	Too many levels of remote in path.
1136	0470	ENOSTR	Device is not a stream.
1137	0471	ETIME	Timer expired.
1138	0472	ENOSR	Out of streams resources.
1139	0473	ENOMSG	No message of the desired type.
1140	0474	EBADMSG	Trying to read unreadable message.
1141	0475	EIDRM	Identifier removed.
1142	0476	ENONET	Machine is not on the network.
1143	0477	ERREMOTE	Object is remote.
1144	0478	ENOLINK	The link has been severed.
1145	0479	EADV	Advertise error.
1146	047A	ESRMNT	srmount error.
1147	047B	ECOMM	Communication error on send.
1148	047C	EPROTO	Protocol error.
1149	047D	EMULTIHOP	Protocol error.
1150	047E	EDOTDOT	Cross mount point.
1151	047F	EREMCHG	Remote address change.
1152	0480	ECANCELED	The asynchronous I/O request has been canceled.
1153	0481	ETcpOutOfState	Socket send/receive gotten out of order.
1154	0482	ETcpUnattach	Unattached streams error.
1155	0483	ETcpBadObj	Streams push object error.
1156	0484	ETcpClosed	Streams closed error.
1157	0485	ETcpLinked	Streams link error.
1158	0486	ETcpErr	Tcp error.
1159	0487	EINTRNODATA	Accept_and_receive is interrupted after the connection arrived but before the first data arrived.
1160	0488	ENOREUSE	Socket descriptor reuse is not supported.
1161	0489	ENOMOVE	FileSystem cannot be moved.
3448	0D78	EUNATCH	The protocol required to support the specified address family is not available.

# **Chapter 3. Reason codes (errnojrs)**

Reason codes are generated by the system in response to either an action or lack of action that has been detected. This section provides descriptions of the various z/OS UNIX reason codes that a user might receive.

# **Description and location information**

Reason codes are sometimes referred to as errnojrs or as errno2 values.

The reason code is made up of 4 bytes in the following format:

cccc rr

- cccc is a halfword reason code qualifier. Generally this is used to identify the issuing module and represents a module ID.
- *rrrr* is the halfword reason code that is described in this documentation. Only this part of the reason code is intended as an interface for programmers.

If the contents of the two high-order bytes are within the range of X'0000' – X'20FF' the error that is represented by the reason code is provided in this documentation. The two high-order bytes of the reason codes returned contain a value that is used to qualify the contents of the two low-order bytes.

If the contents of the two high-order bytes are outside the range, the error that is represented by the reason code is not a z/OS UNIX reason code. Use <u>Table 2 on page 943</u> to determine where additional information on the reason code can be found.

For z/OS UNIX, zFS, TCP/IP and Language Environment reason codes, users can use either the BPXMTEXT TSO/E command or the bpxmtext shell command to display a reason code's meaning and recommended action.

Table 2. Location of return information		
Return code	Reason code qualifier	Reason code returned by
82 (ENOEXEC)	0C27-0C31 0C91-0C94	Failure in extract load module function. This return code is an internal code from the IEWLXLM macro, explaining the details of the error. Either the format of the file was not recognized as an executable or the program object was flagged as nonexecutable. See the sections for exec(), attach_exec(), and spawn() callable services in z/OS UNIX System Services Programming: Assembler Callable Services Reference.
97(EMVSDYNALC)	Dynamic allocation reason code	Dynamic allocation. The reason code is generally associated with a mount failure. For an explanation of the error reason code from DYNALLOC, see Interpreting DYNALLOC return codes in z/OS MVS Programming: Authorized Assembler Services Guide.
98(EMVSCVAF)	CVAF reason code	The reason code for the return code EMVSCVAF is the reason code from CVAF. See <u>z/OS DFSMSdfp Diagnosis</u> for an explanation of the code.
99(EMVSCATLG)	CATALOG reason code	Convert the third byte of the reason code to decimal, which is the return code from Catalog. Convert the last byte of the reason code to decimal, which is the reason code from Catalog. See message IDC3009I in <i>z/OS MVS System Messages, Vol 6 (GOS-IEA)</i> for an explanation of the Catalog return code/reason code.

Table 2. Location of return information (continued)		
Return code	Reason code qualifier	Reason code returned by
9F, A2	Not predictable	The physical file system that owns the file system in error. This internal code explains the error. If the physical file system is managed by DFSMS and the reason code is X'000A' or X'000D', it might indicate a storage shortage that may be relieved by increasing your extended common service area (ECSA). For more information, see the CSA parameter of the IEASYSnn file in z/OS MVS Initialization and Tuning Reference. If any other return code is found, call your IBM service representative.
A3, A4	0000-20FF	System Authorization Facility; for example, RACF. See the specific z/OS UNIX service for the meaning of the reason codes.
All (except A3, A4)	0000-20FF	Reserved for z/OS UNIX. See "z/OS UNIX reason codes" on page 945 for descriptions of these reason codes.
	5B00-5BFF	DFSMS HFS File System. As of z/OS V2R5, HFS is no longer a supported file system type. In reason codes of the form 5BC8xxxx, the xxxx is the reason code from the security product.
	6C00-6CFF	Distributed File Systems Client (DFSC). As of z/OS V1R13, the DFS client function is no longer supported.
	6D00-6DFF	z/OS NFS File System. For a list of reason codes, see Return codes in z/OS Network File System Guide and Reference.
	6E00-6EFF	z/OS NFS File System. For a list of reason codes, see Return codes in z/OS Network File System Guide and Reference.
	6F00-6FFF	z/OS NFS File System. For a list of reason codes, see <u>Return codes</u> in <i>z/OS Network File System Guide and Reference</i> .
	7100-71FF	Reason codes in this range apply to AnyNet Sockets. As of z/OS V1R8, AnyNet Sockets is no longer supported. For reason codes that start with the 7101 reason code qualifier, the reason code is the original errno value that is returned by VTAM.
	7300-787F	z/OS Communications Server TCP/IP Stack. See <u>"z/OS UNIX reason codes" on page 945</u> .
	7880 - 78FF	z/OS Communications Server resolver. See $\underline{z/OS}$ Communications Server: IP and SNA Codes.
	C000 - CFFF	Language Environment errno2 values. See <u>z/OS Language</u> Environment Runtime Messages.
	DF00-DFFF	Distributed File Service File Exporter Exit Routine (IOEGLUE) and DFSKERN. As of V2R4, DFS is no longer supported.
	EF00-EFFF	z/OS File System (zFS). For the reason codes, see EFxxrrrr reason codes in z/OS File System Messages and Codes.
AA(EMVSWLMERR)	WLM reason code	A WLM service failed. See <i>z/OS MVS Programming: Workload Management Services</i> for an explanation of the reason code. The WLM reason code is in the form <i>yyyyxxxx</i> , where <i>xxxx</i> is the only significant value.

# Setting slips to obtain new diagnostic data

If a z/OS UNIX reason code is obtained and additional diagnostics are required, the IBM Support Center personnel might ask that you set a slip trap to collect a dump or trace. The following sections include general instructions on how to gather this documentation.

Reason codes issued by physical file systems such as zFS can also be trapped with this slip.

# Obtaining dumps on specific reason codes

Use SLIP SET to obtain dumps on specific reason codes. The following example shows an example of a SLIP SET command to trap a specified reason code.

```
SLIP SET, IF, A=SYNCSVCD, RANGE=(10?+8C?+F0?+1F4?),
DATA=(13G!!+1B0,EQ,xxxxxxxxx), JL=(OMVS), AL=(H,P,S),
DSPNAME=('OMVS'.B*,'OMVS'.S*),
SDATA=(ALLNUC,PSA,CSA,LPA,TRT,SQA,RGN,SUM), J=jobname,END
```

where *xxxxxxxx* = the 8-digit (4-byte) reason code that is to be trapped. j=jobname is the optional job name that is expected to issue the error (for example, j=IBMUSER).

In rare instances the preceding SLIP command will not capture the requested reason code. Your IBM software support provider can check the specific reason code to see if the SLIP command did not match because the requested reason code was not captured.

# Obtaining GTF trace data sets containing all issued return codes

In some instances your software support provider might say that it is more beneficial to capture a GTF trace that will contain all the reason codes issued by a particular job or at the time of a failure. This is more likely if the reason code is not surfaced externally. If you choose to look at such a GTF trace, be aware that many reason codes are issued validly and do not represent actually errors (that is, reason codes that indicate file not found are usually valid). Before setting the following slip, you must start GTF with options TRACE=SLIP. The slip that would be set is:

```
SLIP SET, IF, A=TRACE, RANGE=(10?+8C?+F0?+1f4?), TRDATA=(13R??+1B0,+B3), END
```

After recreating the problem, stop GTF and format the output using IPCS command GTFTRACE.

# z/OS UNIX reason codes

Value	Description
0000	JROK
	The return code value describes the error.
	Action: Refer to the return code for information on the error.
0011	JRNotKey8
	The task is not in PSW key 8.
	Action: This function requires that the caller be in PSW key 8. The TCBPKF field must also have a value of 8. The request cannot be processed because these conditions have not been met. Correct the problem and rerun the job.
0012	JRMaxChild
	The maximum number of processes for this user ID has been exceeded.
	Action: Ask the system programmer or system administrator to increase the MAXPROCUSER parameter of the BPXPRMxx parmlib member.

Value	Description
0013	JRMaxUIDs
	The maximum number of OpenMVS user IDs is exceeded.
	Action: Ask the system programmer or system administrator to increase the MAXUIDS parameter of the BPXPRMxx parmlib member.
0014	JRAppcErrAlloc
	An APPC/MVS Allocate Conversation error occurred.
	Action: An error occurred in fork during the APPC Allocate Conversation call. The conversation was not allocated. The error may be caused by one or more of the following reasons:
	APPC is not operating.
	<ul> <li>The APPC scheduler is not operating.</li> </ul>
	<ul> <li>The APPC scheduler is malfunctioning.</li> </ul>
	<ul> <li>APPC configuration work was not done correctly when OpenMVS was installed.</li> </ul>
	Ask the operator to:
	<ul> <li>Verify that APPC/MVS is operating by entering a DISPLAY APPC command.</li> <li>Verify that the APPC scheduler is operating by entering a DISPLAY ASCH command.</li> </ul>
	<ul> <li>If the scheduler is operating, verify that it has been started correctly with the proper member name.</li> </ul>
	If the problem cannot be resolved by the operator, contact the system programmer.
0015	JRAppcErrSend
	An APPC/MVS Send_Data error occurred.
	Action: An error occurred in fork during the APPC Send_Data call. The data was not sent. The error may be caused by one or more of the following reasons:
	APPC is not operating.
	<ul> <li>The APPC scheduler is not operating.</li> </ul>
	<ul> <li>APPC configuration work was not done correctly when OpenMVS was installed.</li> </ul>
	Ask the operator to:
	<ul> <li>Verify that APPC/MVS is operating by entering a DISPLAY APPC command.</li> </ul>
	<ul> <li>Verify that the APPC scheduler is operating by entering a DISPLAY ASCH command.</li> </ul>
	<ul> <li>If the scheduler is operating, verify that it has been started correctly with the proper member name.</li> </ul>
	If the problem cannot be resolved by the operator, contact the system programmer.

Value	Description
0016	JRAppcErrRecv
	An APPC/MVS Receive_and_Wait error occurred.
	Action: An error occurred in fork during the APPC Receive_and_Wait call. The data was not received. The error may be caused by one or more of the following reasons:
	APPC is not operating.
	<ul> <li>The APPC scheduler is not operating.</li> </ul>
	<ul> <li>APPC configuration work was not done correctly when OpenMVS was installed.</li> </ul>
	The user security profile may not be correctly set up.
	Ask the operator to:
	<ul> <li>Verify that APPC/MVS is operating by entering a DISPLAY APPC command.</li> </ul>
	<ul> <li>Verify that the APPC scheduler is operating by entering a DISPLAY ASCH command.</li> <li>If the scheduler is operating, verify that it has been started correctly with the proper member name.</li> </ul>
	If the problem cannot be resolved by the operator, contact the system programmer.
0017	JRAppcErrAccept
	An APPC/MVS Accept_Conversation error occurred.
	Action: An error occurred in fork during the APPC Accept_Conversation call. The conversation was not created. The error may be caused by one or more of the following reasons:
	APPC is not operating.
	<ul> <li>The APPC scheduler is not operating.</li> </ul>
	<ul> <li>APPC configuration work was not done correctly when OpenMVS was installed.</li> </ul>
	Ask the operator to:
	<ul> <li>Verify that APPC/MVS is operating by entering a DISPLAY APPC command.</li> </ul>
	<ul> <li>Verify that the APPC scheduler is operating by entering a DISPLAY ASCH command.</li> </ul>
	<ul> <li>If the scheduler is operating, verify that it has been started correctly with the proper member name.</li> </ul>
	If the problem cannot be resolved by the operator, contact the system programmer.
0019	JRAleservErr
	The ALESERV macro failed.
	Action: See your IBM service representative.
001A	JRStgInUse
	The requested storage area has already been allocated (explicit STORAGE request).
	Action: See your IBM service representative.
001B	JRInitPgmErr
	The initialization (INIT) program failed.
	Action: See your IBM service representative.

Value	Description
001C	JRSyseventErr
	A SYSEVENT DONTSWAP/OKSWAP failure occurred.
	Action: See your IBM service representative.
001D	JREstaeErr
	The ESTAE macro failed.
	Action: See your IBM service representative.
001E	JRForkExitRcParentNoRoom
	Not enough work space exists for a parent fork exit.
	Action: There is insufficient internal work space in the parent process for the fork service. The fork service is not performed. Fork uses internal work space to hold fork parent data, which includes the following:
	ESTAE information
	<ul> <li>Vector control information (if applicable)</li> </ul>
	<ul> <li>Ranges of user storage arranged by task, subpool, and key</li> </ul>
	<ul> <li>Content directory elements (CDEs), link list elements (LLEs), and so on</li> </ul>
	Reduce the storage requirement of the program before rerunning the job. Consider the following possibilities:
	<ul> <li>Reduce the number of tasks in the same address space.</li> </ul>
	<ul> <li>Release all unneeded load modules, and so on.</li> </ul>
	If the problem persists, contact the system programmer to increase the work space limit by presenting the requirement to IBM.
001F	JRForkExitRcChildNoStorage
	The system cannot obtain the storage needed for the child process.
	Action: See your IBM service representative.
0020	JRForkExitRcParentBadEnv
	Forking is not supported under the current parent environment. An EAGAIN failure with this reason may be due to a temporary condition that can be resolved by reissuing the fork request.
	Action: The fork service supports only programs running with a PSW security key of 8. The following are conditions in the parent process that may cause this error to be reported:
	• If any (E)SPIE for the current RB is not key 8
	<ul> <li>When any SCB for the current RB is not key 8</li> </ul>
	This EAGAIN failure may also just be due to a temporary condition that can be resolved by re-issuing the fork request.
	Correct any error conditions and resubmit the job.
0021	JRForkExitRcMiscProblem
	A fork exit failure occurred due to miscellaneous problems.
	Action: See your IBM service representative.

Value	Description
0022	JRForkVsmListError
	The VSMLIST macro failed.
	Action: See your IBM service representative.
0023	JRForkVsmListTooLarge
	The storage is insufficient to hold VSMLIST output.
	Action: There is insufficient internal work space in the parent process for the fork service. The fork service is not performed.
	Fork uses internal work storage to hold the VSMLIST output of all the tasks in the fork parent address space. There is insufficient work space for this fork request.
	Reduce the storage requirement of the program before rerunning the job. For example, reduce the number of tasks in the same address space as the fork parent. If the problem persists, contact the system programmer to raise the work space limit by presenting the requirement to IBM.
0024	JRForkRsmCopyError
	The fork real storage manager (RSM) copy service failed.
	Action: See your IBM service representative.
0025	JRUnexpectedErr
	An unexpected error occurred.
	Action: See your IBM service representative.
0026	JRKernelReady
	The system is not in a ready state.
	Action: Retry after OMVS has been allowed to complete initialization.
0028	JRMaxProc
	The maximum number of processes was exceeded.
	Action: Retry after some processes have ended, or change the maximum number of processes allowed.
0029	JRPidBad
	The process ID (PID) indicates an internal error.
	Action: See your IBM service representative.
002A	JRPidNotFound
	A find, delete, or move did not happen.
	Action: See your IBM service representative.
002B	JRNoSecurityProduct
	A security product is not installed.
	Action: A security product (for example, RACF) is required.

Value	Description
002C	JRBldlErr
	The BLDL macro failed.
	Action: See your IBM service representative.
002D	JRCsvQueryErr
	The CSVQUERY macro failed.
	Action: See your IBM service representative.
002E	JRFilesysNotThere
	The file system named does not exist.
	Action: The file system specified on the service could not be found.
002F	JRFilesysWasReset
	The file system named was reset by another user.
	Action: The unmount request that specified drain was reset by another user. Try the unmount request again.
0030	JRNegativeValueInvalid
	A negative value cannot be supplied for one of the parameters.
	Action: Enter the call again after changing the invalid parameter to a valid value.
0032	JrUnlMountRO
	The unlink call was on a read-only file system.
	Action: For the file to be unlinked, the file system must be mounted in read/write mode.
0033	JRRFileWrOnly
	A call tried to read a file opened as write-only.
	Action: Reopen the file for read or read/write access.
0034	JRWFileRdOnly
	A call tried to write to a file opened as read-only.
	Action: Reopen the file for write or read/write access.
0036	JRNegFileDes
	A negative file descriptor was requested.
	Action: Reissue the request with a nonnegative file descriptor.
0037	JRFileDesNotInUse
	The requested file descriptor is not in use.
	Action: Reissue the request with an open file descriptor.
0038	JRMkDirExist
	The requested file directory already exists.
	Action: A directory by this name exists. The MKDIR request cannot be processed. Correct the name and retry the operation.

Value	Description
0039	JRPathTooLong
	The pathname is too long.
	Action: The pathname was found to be larger than PATH_MAX (1023). Either the name specified was too long, or the name generated as a result of using symbolic links was too long. Correct the name and retry the operation.
003A	JRNullInPath
	The pathname or file name contains a null.
	Action: Check the pathname specified to find and remove the embedded null. If the request was for a symbolic link, there must be no nulls within the contents of the symbolic link.
003B	JRNotSysRoot
	A relative pathname is allowed only for processes.
	Action: See your IBM service representative.
003C	JRCompNotDir
	A node in the pathname is not a directory.
	Action: One of the components of the pathname was found to not be a directory. All but the final component of the name must be directories. Correct the pathname and retry the operation.
003D	JRDirNotFound
	A directory in the pathname was not found.
	Action: One of the directories specified was not found. Verify that the name specified is spelled correctly.
003E	JRCompNameTooLong
	A component in the pathname was too long.
	Action: One of the components of the pathname was found to be larger than NAME_MAX (255). Correct the pathname and retry the operation.
003F	JRInvOpenFlags
	The open call detected incorrect open flags.
	Action: The OPEN request cannot be processed. Correct the open flags and retry the operation.
0041	JRTrNotRegFile
	Truncate is valid only on a regular file.
	Action: In order to truncate a file, you must specify the File_descriptor or pathname for a file, not for a directory, a FIFO, or a socket.
0042	JRClNeedClose
	The closedir call was for a file that was opened with the open call.
	Action: Retry the request, using CLOSE.

Value	Description
0043	JRPfsDead
	The file system owning the file is no longer active.
	Action: Retry the request with a file from another file system. If that is not possible, then re-ipl or use SETOMVS RESET= to reactivate the file system.
0044	JRMkDir
	The mkdir service is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0045	JRClose
	The vnode operation CLOSE is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0046	JRRdwr
	Vnode operation RDWR is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0047	JRLookup
	Lookup is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0048	JRForkChildErr
	The fork child process returned an error code.
	Action: See your IBM service representative.
0049	JRVnodGet
	A cell pool get for a vnode failed.
	Action: See your IBM service representative.

Value	Description
004A	JRAppcCheckState
	An APPC/MVS receive error occurred while the APPC/MVS status was being checked.
	Action: An error occurred in fork during the APPC Receive_and_Wait call, which was issued after all the data had been received but before permission to send had been granted by APPC. The error may be caused by one or more of the following reasons:
	APPC is not operating.
	<ul> <li>The APPC scheduler is not operating.</li> </ul>
	<ul> <li>APPC configuration work was not done correctly when OpenMVS was installed.</li> </ul>
	Ask the operator to:
	<ul> <li>Verify that APPC/MVS is operating by entering a DISPLAY APPC command.</li> </ul>
	<ul> <li>Verify that the APPC scheduler is operating by entering a DISPLAY ASCH command.</li> </ul>
	<ul> <li>If the scheduler is operating, verify that it has been started correctly with the proper member name.</li> </ul>
	If the problem cannot be resolved by the operator, contact the system programmer.
004B	JROpen
	The open service is not supported because the file system is not locally mounted.
	Action: Correct the owning system of the file system.
004C	JRCreate
	The create service is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
004D	JRNoPath
	The path length is not greater than 0.
	Action: There must be a positive length passed for the pathname length.
004E	JRNotActive
	The OpenMVS kernel is not active.
	Action: Correct the problem that caused OpenMVS to not start and re-ipl the system to get it started.
004F	JRChdNotDir
	The chdir, fchdir, or chroot service is valid only for directory files.
	Action: Reissue the service specifying a directory file.
0050	JRChdNoEnt
	The chdir or chroot service was invoked with the name of a nonexisting file.
	Action: Reissue the service, specifying the name of an existing directory file.
0051	JRInvalidName
	File system name characters must be greater than 40 (hex) and less than FF (hex).
	Action: Reissue the request specifying a file system name that is made up of printable characters.

Value	Description
0055	JRMkDirROnly
	The directory cannot be created in a read-only file system.
	Action: The file system was mounted read-only. The mkdir service request cannot be processed.
0056	JRLnkDir
	Hard links cannot be made to directory files.
	Action: Use the symlink service to create a symbolic link to the desired directory.
0057	JRLskOnPipe
	The lseek service cannot be performed on a pipe or socket.
	Action: The Iseek service must be performed on either a regular file or a directory.
0058	JRLskOffsetIsInvalid
	The offset given for Iseek service is incorrect.
	Action: The final cursor value on an Iseek call cannot be a negative number. The offset must be nonnegative if the Reference_point specified Set. If it specified Current, then the sum of the input offset and the current cursor value must be nonnegative. If it specified End, then the sum of the input offset and the cursor value of the end of the file must be nonnegative.
0059	JRLskWhenceIsInvalid
	The whence given for the Iseek service is incorrect.
	Action: The Iseek operation can specify a Reference_point of either Set, Current, or $\operatorname{\sf End}$ .
005A	JRFSNotStart
	The file system specified was not started.
	Action: The File_system_type specified must match one of the FILESYSTYPE statements in the BPXPRMxx parmlib member.
005B	JRIsMounted
	The file system is already mounted.
	Action: Issue D OMVS,F to review the locally mounted file system. If the file system is not found and this is a shared file system configuration, issue F BPXOINIT,FILESYS=DISPLAY,ALL to determine if the file system is mounted in the shared hierarchy. If the file system must be mounted on the specified mountpoint, first unmount it, and then reissue the request.

Value	Description
005C	JRMountPt
	A problem was found with the mount point specified.
	Action: The problem found depends on the return code received with this reason code.
	<ul> <li>If the return code is ENOENT, the pathname specified could not be found.</li> </ul>
	<ul> <li>If the return code is ENOTDIR, the pathname did not specify a directory.</li> </ul>
	<ul> <li>If the return code is EINVAL, either the pathname specified refers to the root of an already mounted file system. Or, in the case of a sysplex, the file system may be already mounted on another system in the sysplex or there may be conflicting BPXPRMxx statements for the root.</li> </ul>
005D	JRUnlNoEnt
	The file to be unlinked does not exist.
	Action: The file has either already been unlinked, or it never existed. Verify that the pathname was correct.
005E	JRUnlDir
	The unlink service was requested on a directory file.
	Action: To remove a directory use the rmdir service.
005F	JROutOfOfteCells
	The system was unable to obtain a cell from the OFTE cell pool.
	Action: See your IBM service representative.
0060	JRReadOnlyFileSetWriteReq
	An open request for write was entered for a file system that was mounted read-only.
	Action: The open service request cannot be processed. Mount the file system for read/write access and reissue the open request.
0061	JRReadOnlyFileSetCreatReq
	A file cannot be created in a read-only file system.
	Action: The file system was mounted read-only. The open create service request cannot be processed.
0062	JRNoFileNoCreatFlag
	A service tried to open a nonexistent file without O_CREAT.
	Action: The open service request cannot be processed. Correct the name or the open flags and retry the operation.
0063	JRFileExistsExclFlagSet
	The file exists, but O_EXCL is specified on the open call.
	Action: The open service request cannot be processed. Correct the name or the open flags and retry the operation.

Value	Description
0064	JRDirWriteRequest
	The service tried to open a directory for write access.
	Action: The open service request cannot be processed. Correct the name or the open flags and retry the operation.
0065	JROpenFlagConflict
	The call tried to open a file with O_RDONLY and O_TRUNC specified.
	Action: The open service request cannot be processed. Correct the open flags and retry the operation.
0067	JRParmTooLong
	On the mount, a parameter field longer than 1024 was specified.
	Action: Specify a parameter length less than 500 bytes.
0068	JRRemove
	Vn_Remove is not supported by the physical file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0069	JRBothMode
	On the mount service, both read and read/write were specified.
	Action: The Mount_mode on a mount service cannot specify both read/write and read-only.
006A	JRNeitherMode
	On the mount service, neither read nor read/write were specified.
	Action: The Mount_mode on a mount service must specify either read/write or read-only.
006B	JRBuffTooSmall
	The buffer for return information is too small.
	Action: The length of the buffer specified on the service was not large enough to contain the data to be returned.
006C	JRFileNotThere
	The requested file does not exist.
	Action: The service cannot be performed unless the named file exists.
006D	JRReadDir
	The readdir service vnode operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
006E	JRGetAttr
	GetAttr is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.

Value	Description
006F	JROutOfVFSCells
	The system is unable to obtain a cell from the VFS cell pool.
	Action: See your IBM service representative.
0070	JRRddFileNotDir
	The readdir service request was on a file that was not opened as a directory.
	Action: Use the opendir service to open the directory.
0071	JRTargetNotDir
	The opendir service did not specify a directory.
	Action: The opendir service request cannot be processed. Correct the name and retry the operation.
0072	JROpenDirNotFound
	The directory specified on the opendir service did not exist.
	Action: The opendir service request cannot be processed. Correct the name and retry the operation.
0073	JRNotPRB
	The current request block is not a program request block.
	Action: Issue the service from a program request block (PRB).
0075	JRSpFileExists
	The file specified on the mknod service already existed.
	Action: A file by this name exists. The mknod service request cannot be processed. Correct the name and retry the operation.
0076	JRReadOnlyFileSetMknodReq
	A special file cannot be created on a read-only file system.
	Action: Specify another file system or unmount and then remount the current file system.
0077	JRRmDir
	The rmdir service vnode operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0078	JRPathNotDir
	The pathname does not specify a directory.
	Action: The service requested requires a directory, but the pathname passed is not for a directory.
0079	JRReadOnlyFS
	This operation does not work on a read-only file system.
	Action: The service was requested for a file system that was mounted read-only. The service requires that the file system be mounted read/write.

Value	Description
007A	JRDirInUse
	The requested directory is in use.
	Action: See your IBM service representative.
007B	JRDiffFileSets
	The rename service is not supported across file systems.
	Action: The rename service cannot be performed across file systems. Rename the file, specifying a new name within the same file system.
007C	JRNewNotDir
	The new name specified on the rename service is not a directory.
	Action: If a directory is to be renamed to an existing filename, that filename must refer to a directory file.
007D	JRNewIsDir
	The new name specified on the rename service is a directory.
	Action: If a nondirectory is to be renamed to an existing filename, that filename must not refer to a directory file.
007E	JROldNoExist
	The old name specified on the rename service does not exist.
	Action: The file to be renamed does not exist. Reissue the request with an existing filename.
007F	JRIsFSRoot
	The name specified is in use as a file system root.
	Action: The function cannot be performed on the root of the file system. Unmount drain is not permitted for root.
0080	JRRename
	The rename service vnode operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0081	JRTermReq
	The termination request does not point to PPRP or PPRT.
	Action: See your IBM service representative.
0082	JRDotOrDotDot
	The requested function cannot be performed against dot (.) or dot-dot ().
	Action: Neither dot (.) nor dot-dot () can be specified for this operation.
0083	JRKernelDown
	The kernel has ended during this service.
	Action: z/OS UNIX ended during this service. Ask the operator to enter the command to start OpenMVS. Then reissue the failing service.

Value	Description
0084	JRInternalError
	An internal error was detected.
	Action: See your IBM service representative.
0086	JRBadEntryCode
	An incorrect entry code was specified on this request.
	Action: A command code or entry code specified on the request is not correct. Reissue the command using a valid command code.
0088	JRFdAllocErr
	An error occurred while trying to allocate a file descriptor page.
	Action: Close any file descriptors that are no longer needed.
008A	JRBytes2RWZero
	The number of bytes requested to read or write is negative.
	Action: Specify a positive number for the number of bytes to be read or written.
008B	JRRwdFileNotDir
	The rewinddir service was on a file that is not a directory.
	Action: The rewinddir service requires that the file descriptor passed on input refer to a directory.
008C	JRRootNode
	The requested operation cannot be done on a root.
	Action: The function was requested for a file system root, but it cannot be done on a root.
008D	JRInvalidSignal
	A signal number specified is incorrect.
	Action: Reissue the request with a valid signal number.
008E	JRInvalidSigAct
	The action is incorrect for the specified signal.
	Action: Reissue the request with a valid signal action.
008F	JRInvalidSigHow
	The how operand specified is incorrect.
	Action: Reissue the request with a valid how operand.

Value	Description
0090	JRNotForDir
	The system cannot perform the requested function on a directory.
	Action: The problem could be:
	<ul> <li>The file descriptor specified refers to a directory opened with opendir() service, and the request is not valid for such a file descriptor. Reissue the request specifying a nondirectory file descriptor.</li> </ul>
	<ul> <li>The file specified is a directory, and the request is not valid for such a file. Reissue the request specifying a nondirectory file.</li> </ul>
0091	JROldPartOfNew
	The old name specified on the rename service is part of the new name.
	Action: Reissue the rename request, specifying a new name that does not contain the old name.
0092	JRParmBadSyntax
	A parmlib parameter has a syntax error.
	Action: See your IBM service representative.
0093	JRParmLibIOError
	An I/O error occurred in reading parmlib.
	Action: See your IBM service representative.
0094	JRParmLibOpenFailure
	A parmlib data set cannot be opened.
	Action: See your IBM service representative.
0095	JRParmLibNotFound
	A parmlib member could not be found.
	Action: See your IBM service representative.
0096	JRParmLibBadData
	A parmlib member contains incorrect data.
	Action: See your IBM service representative.
0097	JRParmLibNoAccess
	A parmlib data set cannot be accessed at this time.
	Action: See your IBM service representative.
0098	JRParmBufNoStorage
	Storage could not be obtained for the parameter buffer.
	Action: See your IBM service representative.
009A	JRPgserError
	The page service (PGSER) failed.
	Action: See your IBM service representative.

Value	Description
009C	JRTrOpenedRO
	The ftruncate service was for a file opened in read-only mode.
	Action: In order to be able to truncate a file, open it for write.
009D	JRTrMountedRO
	The ftruncate service was for a file on a file system mounted in read-only mode.
	Action: In order to truncate a file, it must not be on a file system that has been mounted in read-only mode.
009F	JRTrNegOffset
	A negative offset was given to a file truncate service.
	Action: To truncate a file, specify a nonnegative File_length.
00A0	JROutOfLocks
	The file system has run out of locks.
	Action: When a file system lock was requested, there were no more left in the system. Try again later.
00A1	JRMount
	The mount service VFS operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
00A2	JRUMount
	The unmount service VFS operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
00A3	JRSync
	The Sync VFS operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
00A4	JRRoot
	The Root VFS operation is not supported.
	Action: See your IBM service representative.
00A5	JRStatFS
	The StatFS VFS operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
00A6	JRFID
	The Get Fid VFS operation is not supported.
	Action: See your IBM service representative.

Value	Description
00A7	JRVget
	The VGet VFS operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
00A8	JRInvalidVnode
	The vnode returned is not valid.
	Action: See your IBM service representative.
00A9	JRInvalidParms
	An incorrect combination of parameters was specified.
	Action: The actual problem depends on the service.
	<ul> <li>For a w_getmntent service, the entire header area must be zeroed before the first call, and the contents of the header area should not be modified by the caller between calls to this callable service.</li> </ul>
	<ul> <li>For a mount service, Mount_mode must not specify any values unrelated to a mount service.</li> </ul>
	<ul> <li>For an unmount service, Flags must not specify any values unrelated to an unmount service, and must not specify mutually exclusive requests.</li> </ul>
	<ul> <li>For an unquiesce service, Unquiesce_parms must not specify any values unrelated to an unquiesce service.</li> </ul>
	<ul> <li>For a quiesce service, File_System_Name must belong to a file system that is either mounted, or could be mounted.</li> </ul>
	<ul> <li>For tcsetcp, either a reserved flag bit is set or one of the code page names is not null-terminated.</li> </ul>
00AA	JRFsParentFs
	The file system has file systems mounted on it.
	Action: An unmount request can be honored only if there are no file systems mounted anywhere on the requested file system. Use the F BPXOINIT, FILESYS=DISPLAY, ALL command for a shared file system configuration or the DOMVS, FILE command for a non-shared file system configuration to determine which file systems are mounted on the requested file system. Unmount them before retrying this request. Also check the system log for message BPXF271I, which will identify the first mounted file system found.
00AB	JRFsUnmountInProgress
	An unmount service is already in progress.
	Action: The file system named is being unmounted.
00AC	JRFsMustReset
	An unmount service must specify reset when already unmounting.
	Action: In order to unmount immediately, the previous unmount with drain must be reset.

Value	Description
00AD	JRFsForceUmount
	Reset fails when the file system is forced to unmount.
	Action: A reset unmount request will reset only a file system that was unmounting with the drain option.
00AE	JRAudit
	The audit vnode operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
00AF	JRLockErr
	The file system had a lock error.
	Action: See your IBM service representative.
00B0	JRUserNotPrivileged
	The requester of the service is not privileged.
	Action: The service requested required a privileged user. Check the documentation for the service to understand what privilege is required.
00B1	JRUnexpectedError
	An unexpected return value was received.
	Action: See your IBM service representative.
00B2	JRMustUmountImmed
	An immediate unmount must precede a forced unmount.
	Action: Try an immediate unmount before forcing an unmount. A forced unmount can cause data to be lost.
00B3	JRNotQuiesced
	A quiesce service must precede an unquiesce.
	Action: An unquiesce request was received for a file system that was not previously quiesced.
00B4	JRQuiesced
	There was a previous quiesce request.
	Action: The file system required for the current function has been quiesced. After the file system has been unquiesced, retry this service.
00B5	JRInvalidRequester
	The requester of the function cannot make the request.
	Action: The same process that issued the quiesce must also issue the unquiesce, unless force is specified in the Unquiesce_Parms.

Value	Description
00B6	JRPfsSuspend
	The PFS is waiting to restart.
	Action: If there is a WTOR prompt on the operator console the PFS will be restarted when the reply is issued. Otherwise, the PFS will be restarted by its own procedures. Close and reopen the socket or file descriptor and retry the request again after the PFS is active. This value may also be returned if there is a configuration problem and the address space is not connected to the proper PFS.
00B7	JRPfsAbend
	The physical file system abended.
	Action: The file system owning the file abended on the last request. Report this to support personnel. Try the request again, or try it with a file on another system.
00B8	JRNoStorage
	Insufficient storage to copy user parameters.
	Action: Storage cannot be obtained to make a copy of the passed user parameters. This can be caused by one of the following conditions:
	<ul> <li>The user region is filled up and the ?STORAGE request cannot be satisfied.</li> </ul>
	<ul> <li>There is an error in one of the passed user parameters, causing a ?STORAGE request for a huge amount of storage that cannot be satisfied.</li> </ul>
	Check for incorrect input parameters passed to the service. If the parameters are correct, consider increasing the user REGION size.
00B9	JRActiveProcess
	Multiple processes in the address space prevent the termination of the job step process.
	Action: The BPX1MPC service was called from the job step thread while other processes were active in the address space. The request could not be satisfied. The caller should end or clean up all other processes in this address space prior to calling BPX1MPC from the job step thread.
00BA	JRPfsctl
	The Pfsctl operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
00BB	JRPfsInitFailed
	The file system did not initialize.
	Action: Determine why the PFS was unable to initialize and then restart it.
00BC	JRSpawnNoCommonStg
	Spawn cannot be completed because not enough common storage is available to complete the request.
	Action: The system is probably experiencing a common storage shortage and the request cannot be satisfied until the shortage is corrected.

Value	Description
00BD	JRSpawnArgsTooBig
	Spawn cannot be completed because the total length of arguments specified by the caller exceeds the system imposed limit of 1 000 000 bytes.
	Action: The spawn service detected that the length of the argument lists specified by the caller is larger than the system-imposed maximum of 1 000 000 bytes. Correct the argument length and resubmit the job.
00BE	JRFuncUndefined
	The oe_env_np (BPX1ENV) service cannot be completed because the Function_code specified is undefined.
	Action: Reissue the service with a defined Function_code.
00BF	JRBadArgCount
	The oe_env_np (BPX1ENV) service cannot be completed because the number of input or output arguments are incorrect for the Function_code specified.
	Action: Reissue the service with the correct number of input and output arguments appropriate for the Function_code.
00C0	JRBadInputValue
	The oe_env_np (BPX1ENV) service cannot be completed because an input argument contained an undefined value.
	Action: Reissue the service with input value(s) defined for the specified Function_code.
00C1	JRNoUserExit
	A pthread_quiesce (BPX1PTQ) service FREEZE_EXIT request cannot complete because no user exit has been registered with the oe_env_np (BPX1ENV) service.
	Action: Use the oe_env_np (BPX1ENV) service, function code of Freeze_Exit to register a user exit, before using the pthread_quiesce service with a quiesce type of FREEZE_EXIT.
00C2	JRProcessNotFrozen
	A pthread_quiesce (BPX1PTQ) service FREEZE_EXIT request cannot complete because the process is not frozen.
	Action: Use the pthread_quiesce service with a quiesce type of Freeze before using the pthread_quiesce service with a quiesce type of FREEZE_EXIT.
00C3	JRFreezeExitTooSlow
	A pthread_quiesce (BPX1PTQ) service FREEZE_EXIT request cannot complete because user exits did not return in the expected time.
	Action: Examine the user exits to determine why they might hang. The user exits should not be issuing any syscalls or waits.
00C4	JRResrPortSpecified
	During a Socket Bind request, a Reserved Port was incorrectly specified.
	Action: Change the port requested in the Socket Bind request to a non-reserved port. The reserved ports are found in the NETWORK parmlib statement in the BPXPRMxx member.

Value	Description
00C5	JRResrPortNotAvail
	All port zero, INADDR_ANY, reserved ports are in use.
	Action: The system programmer must increase the number of ports that are available by specifying a larger number on the INADDRANYCOUNT parameter of the NETWORK parmlib statement in the BPXPRMxx member, and the appropriate parameter for each Transport Provider. An ipl will be required.
00C6	JRResrPortUsed
	A sockets port assignment conflict exists between OMVS and a Transport Provider.
	Action: The system programmer must make sure the same port numbers specified with the INADDRANYPORT and INADDRANYCOUNT parameters on the NETWORK parmlib statement in the BPXPRMxx member match the port numbers specified on the Transport Providers connected to OMVS. An IPL is required if any changes are made.
00C7	JRTLSRequestInvalid
	An invalid request has been passed for task level security.
	Action: The value passed must be either TLS_CREATE_THREAD_SEC# or TLS_DELETE_THREAD_SEC# as defined in BPXYCONS.
00C8	JRNoReservedPorts
	A bind() syscall that specified port number zero and IP address INADDR_ANY, failed because no ports were reserved.
	Action: Use the INADDRANYPORT and INADDRANYCOUNT parameters on the NETWORK parmlib statement to reserve these ports. An ipl is required if any changes were made.
00C9	JRTLSIDTypeInvalid
	An invalid ID type has been passed for task level security.
	Action: The value passed must indicate a valid ID type as defined in BPXYCONS.
00CA	JRTLSIDLengthInvalid
	An invalid ID length has been passed for task level security.
	Action: The value passed must be in a range appropriate for the field type.
00CB	JRTLSAddressLengthInvalid
	An invalid address length has been passed for task level security.
	Action: The value passed must be in a range appropriate for the field type.
00CC	JRTLSCallerIsIPT
	The calling task is IPT.
	Action: The task level security request is ignored.
00CD	JRTLSNotDoneByOE
	Task level security already exists, but it was not created by a previous call to pthread_security_np.
	Action: The task level security request is ignored.

Value	Description
00CE	JRNoPtraceTaskSec
	Ptrace is active in the caller's address space, task level security not allowed concurrently with Ptrace.
	Action: The caller requested to create or delete task level security.
00CF	JRSAFResourceUndefined
	The resource specified by the caller is not defined to RACF.
	Action: Define the specified resource to RACF or correct the resource name and retry.
00D0	JRSAFParmListErr
	A SAF service was unsuccessful because an error was detected by SAF in the parameter list.
	Action: See your IBM service representative.
00D1	JRSAFNoUUIDtoUser
	No mapping to a RACF userid exists for the DCE UUID specified.
	Action: Define the DCE UUID to RACF and retry the service.
00D2	JRSAFNoUsertoUUID
	No mapping to a DCE UUID exists for the RACF Userid specified.
	Action: Define a DCE UUID for the RACF Userid and retry the service.
00D3	JRSAFNoDCEClass
	The RACF DCEUUIDS class is not active.
	Action: Activate the DCEUUIDS class via the RACF SETROPTS command.
00D4	JRSAFNoCellUUID
	The local cell UUID could not be determined for this RACF userid to DCE UUID conversion request.
	Action: Define a local cell UUID for the specified RACF userid.
00D5	JRClassLenErr
	The length of the RACF class name is outside of the allowable range of 1 to 8.
	Action: Correct the class name length and retry.
00D6	JREntityLenErr
	The length of the RACF entity name is outside of the allowable range of 1 to 246.
	Action: Correct the entity name length and retry.
00D7	JRAccessUndefined
	The access type specified is undefined.
	Action: Correct the access type and retry.

Value	Description
00D8	JRNotServerAuthorized
	The calling address space is not permitted to the BPX.SERVER Facility class or the BPX.SERVER Facility class is undefined and caller not a superuser (UID=0).
	Action: Permit the caller's process to the BPX.SERVER Facility class or make the caller a superuser (UID=0).
00D9	JRNoResourceAccess
	The user specified by the caller does not have the access specified to the resource.
	Action: If the user requires access to the resource, have an authorized user grant the user access permission.
00DA	JRSurrogateUndefined
	The RACF SURROGAT class has not been activated or no SURROGAT class profile has been defined for the client.
	Action: Activate the RACF SURROGAT class and perform the necessary RACF definitions for non-password clients. See
00DB	JRNoSurrogatePerm
	The server is not permitted to the SURROGAT class profile defined for the client.
	Action: Permit the server to the SURROGAT class profile defined for the client. See z/OS UNIX System Services Planning for details.
00DC	JRSAFNotAuthorized
	The calling address space is not authorized to use this service.
	Action: Read the documentation for this service and note its authorization requirements. The action depends on which of the following services was invoked:
	<ul> <li>RACF callable services: Permit the user associated with the address space level identity to the IRR.RDCERUID Facility class profile with READ access.</li> </ul>
	<ul> <li>z/OS Communications Server Network Management Interface: Permit the user associated with the address space level identity to the profile for the service. See z/OS Communications Server: IP Programmer's Guide and Reference for the name of the profile supported by the service.</li> </ul>
00DD	JRNoBufStorage
	Storage could not be obtained for I/O buffers.
	Action: Allocate more storage to the operation
00F6	JRNoVsmList
	Fork cannot be completed because the parent process ended prematurely.
	Action: Correct the condition that caused the parent process to terminate and retry the fork.
00F7	JRForkNoResource
	Fork cannot be processed for lack of resource.
	Action: The fork service was unable to create the child process due to a lack of system resources. The most likely cause is the lack of auxiliary, pageable, or virtual storage. The syslog can be searched for messages reflecting these specific conditions, including messages IRA100E IRA200E IRA400E or IEA602I.

Value	Description
00F8	JRSWAREQ
	The SWAREQ macro failed.
	Action: See your IBM service representative.
00F9	JRSAFNoUser
	The user ID is not defined to the security product.
	Action: Define the user ID to the security product.
00FA	JRSAFGroupNoOMVS
	The current group does not have a GID defined in the OMVS segment.
	Action: Create an OMVS segment with a GID.
00FB	JRSAFUserNoOMVS
	The user ID is not authorized to use OMVS.
	Action: Create an OMVS segment with a UID.
00FC	JRSAFNoUID
	The user ID has no UID.
	Action: Create an OMVS segment with a UID.
00FD	JRSAFNoGID
	The user ID is in a group that has no GID.
	Action: Create an OMVS segment and assign a GID to the group.
00FE	JRSAFInternal
	An internal error occurred in the security product.
	Action: Follow local procedures for reporting internal errors in the security product.
00FF	JRStatusPosted
	A request was received to dub a thread for a process that is stopped or has ended.
	Action: Return to the operating system and allow the process to be cleaned up.
0100	JRTrunc
	Vnode operation trunc is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0101	JRFsync
	Vnode operation fsync is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0102	JRSetAttr
	Vnode operation setattr is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.

Value	Description
0103	JRSymFileAlreadyExists
	The file requested for creation as a symbolic link already exists.
	Action: The link name specified on a symlink service request is an existing filename. Reissue the request specifying a link name that does not already exist.
0104	JRSymlink
	The symbolic link vnode operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0105	JRFileNotSymLink
	The file requested for readlink service is not a symbolic link.
	Action: Reissue the readlink service request specifying a symbolic link.
0106	JRReadlink
	The readlink vnode operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0107	JRMknodInvalidType
	The mknod service invoked with incorrect file type parameter.
	Action: The type specified in the mknod service is not supported. The service cannot be processed. The mknod service accepts only FT_CHARSPEC and FT_FIFO. See BPXYFTYP. Correct the type parameter and retry the operation.
0108	JREndingSlashMknod
	The pathname ended with a slash on the mknod service.
	Action: The pathname specified for a mknod service request ended with a slash.
	The service request cannot be processed. Correct the name and retry the operation.
0109	JREndingSlashOCreat
	The pathname in the open service, with the O_CREAT option, ended with slash.
	Action: The open service request cannot be processed. Correct the name and retry the operation.
010A	JRLnkNoEnt
	The service tried to link to nonexistent file.
	Action: Use the open service to create the file, or reissue the request specifying an existing filename.
010B	JRLnkNewPathExists
	The service tried to add a link whose name already exists.
	Action: Reissue the request, specifying a new pathname that does not already exist.

Value	Description
010C	JRLnkAcrossFilesets
	The service tried to link across file systems.
	Action: Reissue the request, specifying a new pathname that is within the same file system as the existing pathname.
010D	JRLnkROFileset
	The service tried to add a directory entry on a read-only file system.
	Action: To create a link to the existing pathname, the file system must be mounted in read/write mode.
010E	JRLink
	Vn_Link is not supported by this physical file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
010F	JRExecNmLenZero
	The length of the executable name passed was zero.
	Action: The parameter specifying the length of the program name to be run contained zero. Correct the program name length and resubmit the job.
0111	JRParmlibSuffixTooLong
	The parmlib member name suffix is more than two characters.
	Action: See your IBM service representative.
0112	JRFsFailStorage
	Dub or fork failed due to unavailable file system storage.
	Action: See your IBM service representative.
0113	JRFsFailQuiesce
	Dub or fork cannot complete, because the working directory is unmounted.
	Action: The initial working directory exists in a file system that is being quiesced in preparation for being unmounted. Select another initial working directory, or reissue the request after the file system has been mounted again.
0114	JRNotPermitted
	You are not permitted to signal to the specified process ID (PID).
	Action: Reissue the request specifying a PID that you are authorized to send a signal to, or reissue the request from a superuser ID.
0115	JRBuffLenInvalid
	The length of the buffer is less than or equal to zero or less than a minimum length.
	Action: The buffer length specified for this request was a negative number, zero, or less than a minimum length. Retry the request specifying a valid buffer length parameter.

Value	Description
0117	JRNotRegistered
	The call is not registered for signals.
	Action: Reissue the request after registering the task for signals with the BPX1MSS service.
0119	JRNotSupportedForFileType
	The requested service is not supported for this file type.
	Action: Reissue the request, specifying a file of the correct type for the request.
011A	JRInvalidSymLinkLen
	The contents specified for the symbolic link has an incorrect length.
	Action: Reissue the symlink request specifying a path length greater than zero, but less than or equal to 1023.
011B	JRInvalidSymLinkComp
	The contents specified for symbolic link has an incorrect component.
	Action: The contents of a symbolic link must consist of components whose length cannot exceed 255 characters.
011C	JRFileNotOpen
	The file is not opened.
	Action: Reissue the request specifying an open file descriptor.
011D	JRTooManySymlinks
	Too many symbolic links were encountered in the pathname.
	Action: While attempting to resolve the input pathname, more than 100 symbolic links were found.
011E	JRMVSArgTooBig
	The execMVS argument string was too long.
	Action: The execMVS service detected that the length of the argument list specified by the caller is larger than the system-imposed maximum of 4096 bytes. Correct the argument length and resubmit the job.
011F	JRExecNotRegFile
	The filename specified on the exec is not a regular file.
	Action: The exec service detected that the filename specified by the pathname argument is not a regular type file. Correct the pathname argument and resubmit the job.
0120	JRAppcErrRecvIncomp
	An APPC/MVS Receive_and_Wait error occurred. The data is incomplete.
	Action: An error occurred in fork during the APPC Receive_and_Wait call. Incomplete data was received. If the problem recurs, contact the system programmer.

The call tried an unauthorized access to a fork child transaction program.  Action: The fork child process determined that the fork child transaction phas been invoked improperly, perhaps due to unauthorized access to the protransaction program name for fork child is 30F0F7F8.  D122  JRInactive  The vnode operation inactive is not supported by the file system.  Action: Verify that the operation was performed on a physical file system supports the operation.  JRInvalidMajorNumber  Character special file system detected an incorrect device major number.  Action: This character special file is not supported by any device drivers in on this system. The request cannot be processed. Correct the pathname and request.  JROutofPnodeCells  No pnode/pnwt cells are available.  Action: See your IBM service representative.	
Action: The fork child process determined that the fork child transaction process has been invoked improperly, perhaps due to unauthorized access to the process transaction program name for fork child is 30F0F7F8.  Ol22 JRInactive The vnode operation inactive is not supported by the file system. Action: Verify that the operation was performed on a physical file system supports the operation.  Ol23 JRInvalidMajorNumber Character special file system detected an incorrect device major number. Action: This character special file is not supported by any device drivers in on this system. The request cannot be processed. Correct the pathname and request.  Ol24 JROutofPnodeCells No pnode/pnwt cells are available.	
has been invoked improperly, perhaps due to unauthorized access to the protection program name for fork child is 30F0F7F8.  0122 JRInactive The vnode operation inactive is not supported by the file system. Action: Verify that the operation was performed on a physical file system supports the operation.  0123 JRInvalidMajorNumber Character special file system detected an incorrect device major number. Action: This character special file is not supported by any device drivers in on this system. The request cannot be processed. Correct the pathname and request.  0124 JROutofPnodeCells No pnode/pnwt cells are available.	
The vnode operation inactive is not supported by the file system.  Action: Verify that the operation was performed on a physical file system supports the operation.  JRInvalidMajorNumber  Character special file system detected an incorrect device major number.  Action: This character special file is not supported by any device drivers in on this system. The request cannot be processed. Correct the pathname and request.  JROutofPnodeCells  No pnode/pnwt cells are available.	
Action: Verify that the operation was performed on a physical file system supports the operation.  O123 JRInvalidMajorNumber  Character special file system detected an incorrect device major number.  Action: This character special file is not supported by any device drivers in on this system. The request cannot be processed. Correct the pathname and request. supports the operation.  JRInvalidMajorNumber  Character special file system detected an incorrect device major number.  Action: This character special file is not supported by any device drivers in on this system. The request cannot be processed. Correct the pathname and request.  JROutofPnodeCells  No pnode/pnwt cells are available.	
Character special file system detected an incorrect device major number.  Action: This character special file is not supported by any device drivers in on this system. The request cannot be processed. Correct the pathname and request.  JROutofPnodeCells No pnode/pnwt cells are available.	that
Action: This character special file is not supported by any device drivers in on this system. The request cannot be processed. Correct the pathname and request.  124  3ROutofPnodeCells  No pnode/pnwt cells are available.	
on this system. The request cannot be processed. Correct the pathname and request.  O124  JROutofPnodeCells  No pnode/pnwt cells are available.	
No pnode/pnwt cells are available.	
Action: See your IBM service representative.	
0125 JRRdandWRTforPipe	
The open call on a pipe was for read/write.	
Action: The request cannot be processed. Correct the open flags and retry request.	y the
0126 JRQueueManPutFailed	
The queue manager returned an incorrect return code.	
Action: See your IBM service representative.	
0127 JRQueueManGetFailed	
The queue manager returned an incorrect return code.	
Action: See your IBM service representative.	
0128 JROpenforWriteNoReaders	
Open for write was done before any open for read.	
Action: Open for write was requested while file flags indicated O_NONBLO before any open for read. The request cannot be processed. An open for reamont precede an open for write request.	
0129 JRNoReaders	
The service tried to write before any open for reads.	
Action: An open for read must be performed.	

specifies the length of the variable-length parameter that comes next.  The length of a fixed-length parameter exceeds the allowable value. The maximum length of any fixed-length parameter cannot exceed 5000 bytes.  The size of an input buffer to be used for holding an output variable length parameter is specified as more than 5000 bytes. The actual maximum size of the parameter is much less. This error is reported for performance reasons, to avoid inefficient usag of system resources, including storage and processing time. Specify a smaller size the input buffer.  If this error is returned by one of the z/OS Communications Server Real-time application-controlled TCP/IP trace NMI requests, then one of the following errors occurred:  The specified length of the input buffer is shorter than the size of the input RCCHeader structure.  For the RCCOpen request, the specified length of the input buffer is shorter than the size of the input RCCHeader and RCCOpenInfo structures.  In program abended in the fork module.  Action: See your IBM service representative.  If program abended in a fork exit.  Action: See your IBM service representative.  If program abended in a system call.  Action: See your IBM service representative.  If program abended in a system call.  Action: See your IBM service representative.	Value	Description
Action: Check for incorrect input parameters passed to the service. One of the following conditions may have occurred:  The specified length of a variable-length parameter is negative. (This error is applicable only to programs issuing callable services through the assembler interface.) The length of a variable-length parameter cannot be negative. Services with variable-length parameters normally specify them in pairs. The first of the pair specifies the length of a fixed-length parameter exceeds the allowable value. The maximum length of any fixed-length parameter exceeds the allowable value. The maximum length of any fixed-length parameter cannot exceed 5000 bytes.  The size of an input buffer to be used for holding an output variable length parameter is specified as more than 5000 bytes. The actual maximum size of the parameter is much less. This error is reported for performance reasons, to avoid inefficient usag of system resources, including storage and processing time. Specify a smaller size the input buffer.  If this error is returned by one of the z/OS Communications Server Real-time application-controlled TCP/IP trace NMI requests, then one of the following errors occurred:  The specified length of the input buffer is shorter than the size of the input RCCHeader structure.  For the RCCOpen request, the specified length of the input buffer is shorter than the size of the input RCCHeader and RCCOpenInfo structures.  1012B  JRForkAbend  The program abended in the fork module.  Action: See your IBM service representative.  1012C  JRForkExitAbend  An abend occurred in a fork exit.  Action: See your IBM service representative.  1012B  JRSyscallAbend  An abend occurred in a system call.  Action: See your IBM service representative.  1012C  JRBadAddress  An incorrect address was encountered when the system tried to access data.  Action: An error occurred while the system was accessing the user data. Check for incorrect input parameters passed to the system call.	012A	JRInvParmLength
following conditions may have occurred:  The specified length of a variable-length parameter is negative. (This error is applicable only to programs issuing callable services through the assembler interface.) The length of a variable-length parameter cannot be negative. Services with variable-length parameters normally specify them in pairs. The first of the pair specifies the length of the variable-length parameter that comes never the comes of the pair specifies the length of any fixed-length parameter exceeds the allowable value. The maximum length of any fixed-length parameter cannot exceed 5000 bytes. ·		Action: An error occurred while the system was accessing the user data. Check for incorrect input parameters passed to the system call.
An unexpected error occurred in load 16 and jump.	012F	JRL16Jump
		An unexpected error occurred in load 16 and jump.
Action: See your IBM service representative.		Action: See your IBM service representative.

Value	Description
0130	JRSigDuringWait
	A signal occurred during a wait.
	Action: While the service was waiting, a signal was received to interrupt it.
0131	JRQueueManOpenFailed
	The queue manager was unable to create a queue.
	Action: See your IBM service representative.
0132	JRQueueManCloseFailed
	The queue manager returned a nonzero return code on a close service.
	Action: See your IBM service representative.
0133	JRRdnorWRTforPipe
	The open service on a pipe was for neither read nor write.
	Action: The request cannot be processed. Correct the open flags and retry the service.
0134	JROutofVnodeCells
	No vnode cells are available.
	Action: See your IBM service representative.
0135	JRNoData
	There is no data in this pipe.
	Action: Try this service again later.
0136	JRUserNotAuthorized
	The user is not authorized for the requested file descriptor.
	Action: When the specified file descriptor was opened, the user was executing in an authorized state. However, the user is now no longer authorized to use this file descriptor. Reissue the request, specifying a file descriptor to which the user has authority.
0138	JRFileIsBlocked
	The file is blocked.
	Action: The request cannot be processed. Try again later.
0139	JRIoctl
	The ioctl service is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
013A	JRInvalidPid
	The process ID (PID) was not found, so the signal was not sent.
	Action: The target PID was either ended, or it never existed. Retry the function with an existing PID.

Value	Description
013B	JRVfsIoctl
	The Vfsioctl service is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
013C	JRInvRbState
	Callable services cannot be nested.
	Action: The system detected a nested callable service. That is, a request block (RB) issued a callable service and was interrupted by an interrupt request block (IRB) in an STIMER exit. Any additional callable services that the RB tries to issue are detected and flagged as errors. Correct the problem and resubmit the job.
	This error might also be caused by repeated abends from recovery processing. If z/OS UNIX cannot successfully clean up resources, no further syscalls will be allowed on the task.
013D	JRWrongInstance
	The process is not known to current kernel instance.
	Action: The kernel was refreshed. That is, OpenMVS has been stopped and restarted. Either issue a call to BPX1MPC (the MVS process cleanup) to clean up the process before issuing another service request, or end the job.
013E	JRVfsInact
	The InAct VFS operation is not supported.
	Action: See your IBM service representative.
013F	JRInvTermStat
	An incorrect process termination status was passed to BPX1MPC.
	Action: Structure BPXYWAST describes the valid terminating status.
0140	JRActiveThreads
	The process could not be terminated because there are multiple threads still running in the process.
	Action: The BPX1MPC service was called from the initial thread while other threads were active in the process. The request could not be satisfied. The caller should end or clean up all other threads before calling BPX1MPC from the initial thread.
0141	JRBadExitStatusAddr
	An incorrect exit status address was passed to the wait or wait-extension service.
	Action: Reissue the call to the wait service (BPX1WAT) or wait-extension service (BPX1WTE) with an exit status return area address that is accessible to the caller.
0142	JRWaitError
	An unexpected error occurred in the wait service.
	Action: See your IBM service representative.

Value	Description
0143	JRProcessEnding
	The current process is ending.
	Action: New services cannot be issued until this termination is complete.
0144	JRSignalsNotBlocked
	The service did not complete because signals are not blocked.
	Action: This service can be run only if all signals are blocked.
0145	JRFdTooBig
	The requested file descriptor exceeds the Open_max limit.
	Action: Reissue the request, specifying a file descriptor that does not exceed the Open_max limit.
0146	JROpenMax
	The maximum number of open files for this process was reached.
	Action: Close any file descriptors that are no longer needed.
0147	JRBadUidtSlot
	The slot passed to BPXPRCHK is not a valid index for the UIDT table.
	Action: See your IBM service representative.
0148	JRResMgr
	The RESMGR macro returned a negative status.
	Action: See your IBM service representative.
0149	JRIOBufLengthInvalid
	The input argument buffer length was incorrect.
	Action: The argument length specified for this request was either a negative number, or was greater than 51200. Reissue the request and specify a valid argument length parameter.
014A	JRInvalidAmode
	An incorrect access mode was specified on the access service.
	Action: The access mode specified on the access service has unsupported bits turned on. Reissue the request and specify a valid access mode.
014B	JRAccess
	The access vnode operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
014C	JRUIDchanged
	The slot passed to BPXPRCHK is not valid for the UID specified.
	Action: See your IBM service representative.

Value	Description
014D	JRFsFailChdir
	The dub failed, due to an error with the initial home directory.
	Action: There is a problem with the initial home directory. Verify that the initial home directory exists and that the user has authorization to it.
014E	JRFsFailLock
	The dub failed, due to an error getting necessary file system locks.
	Action: See your IBM service representative.
014F	JRUpdateUidtFailure
	The update to UIDT in BPXPRCHK failed.
	Action: See your IBM service representative.
0150	JRBadAuditOption
	An incorrect option code was specified for the chaudit service.
	Action: Reissue the request and specify a valid audit option code.
0151	JRExecFileTooBig
	The size of the specified file exceeds the private region of the caller.
	Action: The exec service detected that the size of the executable to be run exceeds the size of the caller's private region.
0152	JRInvalidCursor
	The cursor value passed to the w_getmntent call is incorrect.
	Action: Before the first call to w_getmntent, the header area of the buffer must be zero, and the contents of the header area should not be modified by the caller between calls to this callable service.
0157	JRPtySubsidiaryOpened
	The open of the manager pseudo-TTY failed, because the associated subsidiary pseudo-TTY is still open.
	Action: This may be a common system condition. One or more processes from a previous pseudo-TTY connection are processing and using the subsidiary pseudo-TTY file. When all the processes close, the manager and subsidiary pseudo-TTY pair is again available for use. Choose another pair of pseudo-TTY files. Alternatively, kill all the processes that are using the subsidiary pseudo-TTY file and reattempt the open service.
0154	JRPtyMinorInvalid
	The device minor number is larger than the MAXPTYS parameter in the BPXPRMxx member.
	Action: Contact the system programmer or system administrator to either redefine the manager and subsidiary pseudo-TTY file pair to have a device minor number less than or equal to the MAXPTYS parameter of the BPXPRMxx parmlib member, or increase the value for MAXPTYS.

Value	Description
0155	JRPtyAlreadyActive
	The device minor number is already active.
	Action: This may be a common system condition. This error generally indicates that the manager pseudo-TTY file specified is in use by another process. Choose another manager pseudo-TTY file.
0156	JRSignalReceived
	The call was interrupted by a signal.
	Action: A signal was received while this callable service was blocked. Retry the service if appropriate.
0158	JRPtyManagerClosed
	There is no corresponding manager pseudo-TTY file open.
	Action: The application should be coded so the manager pseudo-TTY is opened prior to the corresponding subsidiary pseudo-TTY file.
	This may also be a result of a temporary system condition: A pseudo-TTY connection was established, and a subsidiary pseudo-TTY open occurred after the pseudo-TTY connection was severed (due to the manager pseudo-TTY file being closed). In this case, all file descriptors associated with the subsidiary pseudo-TTY must be closed before the manager-subsidiary pseudo-TTY files for this device minor number can be reused.
0159	JRPtyDifferentFile
	A subsidiary file for this minor number with a different filename is already open.
	Action: Only one subsidiary file should be defined for this device minor number. Contact the system administrator or system programmer to correct the definition of this file.
015B	JRPtySubsidiaryNotInit
	The subsidiary support did not complete successfully.
	Action: Contact the system administrator or system programmer to determine why the subsidiary support did not initialize correctly.
015C	JRPtyInputStopped
	The nonblocked write failed, because input is stopped.
	Action: Input has been stopped by a tcflow service. Issue a tcflow to start input back up and reissue the read.
015E	JREOFAlreadySent
	The write to the manager pseudo-TTY failed, because all subsidiaries are closed and HUPCL was set.
	Action: An attempt was made to send some data on the manager pseudo-TTY after all subsidiaries file descriptors were closed and HUPCL set.

Value	Description
0160	JRPtyOrphanedWrite
	The write service is processing in a background, orphaned process group.
	Action: This condition most likely occurs when a process that is forked from the session leader (generally the shell) attempts to write to the pseudo-TTY device after the session leader process has ended. The process cannot read from or write to the terminal once the session leader process ends. This pseudo-TTY session is no longer usable. Restart the application from another session.
0161	JRPtyOutputStopped
	Write cannot be processed, because output has stopped.
	Action: Output was stopped by a tcflow service or entry of the STOP character. Issue a tcflow or enter a START character to start output back up and reenter the read.
0163	JRPtyNoData
	Data or room is not available on the queue.
	Action: For input, no data is available on the queue. For output, no room is available on the queue. For writes to a subsidiary pseudo-TTY, this includes the case of a full output queue when echoing is active. Reissue the request again later.
0164	JRPtyOrphanedRead
	The read service is processing in a background, orphaned process group.
	Action: This condition most likely occurs when a process that is forked from the session leader (generally the shell) attempts to read from the pseudo-TTY device after the session leader process has ended. The process cannot read from or write to the terminal once the session leader process ends. Reissue this command or restart the application from another session.
0165	JRPtySIGTTINBlocked
	The process is in a background process group and SIGTTIN is blocked or ignored.
	Action: If the SIGTTIN signal is either blocked or ignored, the read service can be issued only from a process that is running in a foreground process group.
0166	JRPtyNoBufStorage
	Storage is not available for pseudo-TTY buffers.
	Action: Retry the open request. If this condition persists, contact the system programmer.
0167	JRFuncNotSupported
	The function is not supported by device driver.
	Action: See your IBM service representative.
0168	JRConv2TicksFailed
	The time value is too large to convert to ticks.
	Action: See your IBM service representative.

Value	Description
0169	JRPtAttemptedCRStore
	Ptrace attempted to store into a control register.
	Action: A debugger program tried to store into a control register using ptrace. The debugger program can read but not write to the control registers.
016A	JRPtAttemptedPSW0Store
	Ptrace attempted to store into the left half of PSW.
	Action: A debugger program tried to store into word 0 (left half) of the PSW using ptrace. Only word 1 (right half) of the PSW can be changed by debugger programs.
016B	JRPtCellNotAvail
	There is not enough storage for ptrace.
	Action: See your IBM service representative.
016C	JRPtDbdEqualsDbr
	The ptrace debugger process ID (PID) is the same as the debugged PID.
	Action: A debugger program tried to start a debugging session with its own process ID (PID) as the target. Debugger programs cannot debug themselves.
016D	JRPtDbdParentTerm
	The ptrace debugged parent (debugger) ended.
	Action: An attempt was made to start a debugging session using ptrace in a process to be debugged. There are two distinct cases:
	<ol> <li>A PT_TRACE_ME ptrace request was issued in the child process of a debugger program.</li> </ol>
	<ol><li>A process being debugged created a child using fork, and the child process tried to start a debugging session because ptrace multiprocess debugging is activated.</li></ol>
	In either case, the parent of the process trying to start the debugging session has ended. This means either the debugger program has ended, or the parent of the newly forked child process has ended. Restart the debugger program and reestablish the debugging session.
016E	JRPtDbdPidNotFound
	The ptrace target debugged process ID (PID) is incorrect.
	Action: A debugger program issued a ptrace request, but the target process ID (PID) is not valid. If the ptrace request was to start a debugging session, ensure that the target PID is valid. If the debugging session was already established, the target process may have ended unexpectedly. Reestablish a debugging session with the target process.
016F	JRPtDbrPidNotFound
	The ptrace debugger ended.
	Action: An attempt was made to use ptrace to start a debugging session, but the debugger program has ended and its process ID (PID) is no longer valid. Restart the debugger program and reestablish the debugging session.

Value	Description
0170	JRPtDbrZombie
	Ptrace debugger is ending.
	Action: An attempt was made to use ptrace to start a debugging session, but the debugger program is ending. Restart the debugger program and reestablish the debugging session.
0171	JRPtInvCallingMode
	The ptrace caller mode is incorrect.
	Action: A ptrace request has been issued by a caller running with a PSW key other than 8, but ptrace supports only key 8 callers.
0172	JRPtInvDbdAddress
	An incorrect address was supplied for the debugged process.
	Action: A debugger program has tried to read or write storage in a debugged process, but the supplied storage address is not valid. Ensure that a valid storage address or address range is supplied on the ptrace request.
0173	JRPtInvDbrAddress
	An incorrect address was supplied for the debugger process.
	Action: A debugger program has supplied a buffer in which debugged process information should be read into, or which is the source for information to be written to the debugged process. The buffer address is not valid. Ensure that a valid buffer address or address range is supplied on the ptrace request.
0174	JRPtInvFPRNumber
	The ptrace call has an incorrect floating point register number.
	Action: A debugger program has tried to read or write a floating point register, but supplied an invalid floating point register number. Ensure that a valid floating point register number is supplied on the ptrace request. The register numbers are defined in the BPXYPTRC macro.
0175	JRPtInvGPRNumber
	The ptrace call has an incorrect general register number.
	Action: A debugger program tried to read or write a general or machine control register, but supplied an incorrect register number. Ensure that a valid register number is supplied on the ptrace request. The register numbers are defined in the BPXYPTRC macro.
0176	JRPtInvLength
	The ptrace length is incorrect.
	Action: A debugger program supplied a buffer in which debugged process information should be read into, or which is the source for information to be written to the debugged process. The length associated with the buffer is too large. The maximum allowable length is defined in the BPXYPTRC macro.

Value	Description
0177	JRPtInvNumberThreads
	The ptrace target process has no threads.
	Action: A debugger program tried to start a debugging session with a process that contains no threads. Only dubbed processes can be debugged.
0178	JRPtInvPtraceState
	The ptrace mode of target process is incorrect.
	Action: An attempt was made to use ptrace to start a debugging session with a target process. The ptrace mode (active or inactive) of the target process is inconsistent with the type of ptrace initiation request. The following are possible causes:
	<ol> <li>A PT_TRACE_ME or PT_ATTACH ptrace request was issued to start a new debugging session, but the target process is already being debugged.</li> </ol>
	2. A PT_REATTACH ptrace request was issued to restart an existing debugging session, or a process being debugged while in multiprocess debugging mode has created a new child with fork, and the child attempted to start a debugging session, but the target process or new child was not already in ptrace mode.
	<ol><li>During initiation of a debugging session, resources that would indicate the process is already being debugged were detected. This could indicate incomplete cleanup of a previous debugging session.</li></ol>
	If you were trying to attach or reattach to a process for debugging purposes, verify that you specified the correct process ID (PID). Otherwise, contact the system programmer to determine the problem with the target process.
0179	JRPtInvRequest
	The ptrace request was not valid.
	Action: A ptrace request was issued with a request type that is not valid. Reissue the ptrace request with a valid request type.
017A	JRPtInvSignalNumber
	The ptrace service does not have a valid signal number.
	Action: A debugger program tried to continue or detach from a debugged process but has supplied an incorrect signal number. Ensure that a valid signal number is supplied on the ptrace request. The signal numbers are defined in the BPXYSIGH macro.
017B	JRPtInvUareaOffset
	The ptrace service does not have a valid offset into the user area.
	Action: A debugger program tried to read the user area of a debugged process, but has supplied an incorrect user area offset. Ensure that a valid user area offset is supplied on the ptrace request. The user area offsets are defined in the BPXYPTRC macro.

Value	Description
017C	JRPtOldDbrPidNotFound
	The ptrace original debugger ended.
	Action: A debugger program has tried to reattach to a debugged process to reestablish a debugging session. The previous (original) debugger program associated with the debugged process has ended. This could indicate that the new debugger program was attempting to reattach at the same time the original debugger program was ending. Restart the debugger programs to reestablish the desired debugging sessions.
017D	JRPtStateError
	The ptrace service has detected an internal state error.
	Action: See your IBM service representative.
017E	JRPtProcessNotPtraced
	The ptrace target process is not in ptrace mode.
	Action: A debugger program issued a ptrace request, but the target process is not being debugged. Reissue the ptrace request with the correct process ID (PID).
017F	JRPtProcessNotStopped
	The ptrace target process was not stopped for ptrace.
	Action: A debugger program issued a ptrace request, but the target process is not currently in a stopped state. The ptrace service request can be issued only when the target process is in a stopped state.
0180	JRPtProcessTerm
	The ptrace target process ended.
	Action: A debugger program issued a ptrace request, but the target process has ended unexpectedly. Restart the debugger program and reestablish the debugging session.
0181	JRPtRecoveryEntered
	Ptrace error recovery was entered.
	Action: See your IBM service representative.
0182	JRPtRestrictedProcess
	The ptrace target process is restricted from debugging.
	Action: A debugger program tried to initiate a debugging session with a process that is restricted from being debugged. The following types of processes are restricted:
	MVS system address spaces
	The initial process, with a process ID (PID) of 1
0183	JRPtSigInterrupt
	The ptrace request was interrupted by a signal for the debugger.
	Action: A debugger program issued a ptrace request, but a signal that either is being caught by or would end the debugger program has interrupted the ptrace request.

Value	Description
0184	JRTIMUnexpectedErr
	An error occurred in the times call.
	Action: See your IBM service representative.
0185	JRExecUnexpectedErr
	An error occurred in exec and execmvs services.
	Action: See your IBM service representative.
0186	JRExecParmErr
	An error occurred when copying parameters passed to the exec service.
	Action: An error occurred while copying parameters specified by the caller of the exec service. The probable causes are:
	<ul> <li>An incorrect address in the argument or environment length lists.</li> </ul>
	<ul> <li>An incorrect address in the argument or environment data lists.</li> </ul>
	<ul> <li>An incorrect argument or environment data length.</li> </ul>
	Correct any error conditions in the parameter data specified by the caller, and resubmit the job.
0187	JRChowntoPipe
	The fchown service was issued against a pipe.
	Action: This request cannot be performed against a pipe. Select a file descriptor that refers to a nonpipe file and reissue the request.
0188	JRChaudtoPipe
	The fchaudit service was issued against a pipe.
	Action: This request cannot be performed against a pipe. Select a file descriptor that refers to a nonpipe file and reissue the request.
0189	JRExecKernErr
	An error occurred in the exec call.
	Action: See your IBM service representative.
018A	JRBadRBState
	The caller's request block state was incorrect.
	Action: A function was requested that requires the user to be running under the same request block that its thread was created under or from which it issued the signal setup service (BPX1MSS). The condition is probably the result of issuing a request block-sensitive service after a link was done.
018B	JRSignalError
	A signal error occurred.
	Action: See your IBM service representative.

Value	Description
018C	JRInvalidSigProc
	The mask address was incorrect.
	Action: The address of the signal mask passed to this function was not valid. Retry the function with a valid address pointing to the signal mask.
018D	JRBadAlet
	An incorrect ALET was given as input.
	Action: Do not specify an ALET of 1. Do not specify an ALET of 0 unless the secondary and home address spaces are the same.
018E	JRRMGUnexpectedErr
	An error occurred in the resource call.
	Action: See your IBM service representative.
018F	JRQuiescing
0101	The call did not complete. The file system is not in an active state. This may be a temporary condition. One of the following conditions apply: (1) The file system is in the process of being unmounted or is unmounted. (2) An attempt to unmount the file system occurred, but failed. The file system is in the IMMEDIATE UNMOUNT ATTEMPTED state. (3) The file system is in the process of remounting. (4) The file system ownership is in the process of moving to another system. (5) The file system is NOT ACTIVE or UNOWNED.
	Action: Use the D OMVS, FILE, NAME = system command to determine the status of the file system. Perform the following actions, depending on the file system state:
	<ul> <li>If the file system is ACTIVE then retry the operation. If the problem persists then the application should be recycled or otherwise close() and open() the file.</li> </ul>
	<ul> <li>If the file system state is IMMEDIATE UNMOUNT ATTEMPTED then the file system must be unmounted using the FORCE option.</li> </ul>
	<ul> <li>If the file system state is UNOWNED then follow local procedures to recover the file system. If the file system is mounted with the NOAUTOMOVE option then the file system will be recovered once the original owner system reinitializes.</li> </ul>
	<ul> <li>If the file system state is NOT ACTIVE then unmount the file system with the FORCE option. If this is not successful and this is a shared file system configuration then use the F BPXOINIT, FILESYS=UNMOUNT command to unmount the file system.</li> </ul>
0190	JRPtyInvalidAction
	The action code is incorrect.
	Action: An incorrect action code was specified. Correct the program and rerun.
0191	JRPtyInvalidCcflag
	The c_cflag bits are incorrect.
	Action: An undefined bit was set in the c_cflag field of the termios. The termios structure used in a tcsetattr request should be derived from an earlier tcgetattr request, and only defined bits in the c_cflag field should be altered. Correct the program and rerun.

JRPtyInvalidClflag
on tylivalidentag
The c_lflag bits are incorrect.
Action: An undefined bit was set in the c_lflag field of the termios. The termios structure used in a tosetattr request should be derived from an earlier togetattr request, and only defined bits in the c_lflag field should be altered. Correct the program and rerun.
JRPtyInvalidCiflag
The c_iflag bits are incorrect.
Action: An undefined bit was set in the c_iflag field of the termios. The termios structure used in a tosetattr request should be derived from an earlier togetattr request, and only defined bits in the c_iflag field should be altered. Correct the program and rerun.
JRPtyInvalidCoflag
The c_oflag bits are incorrect.
Action: An undefined bit was set in the c_oflag field of the termios. The termios structure used in a tosetattr request should be derived from an earlier togetattr request, and only defined bits in the c_oflag field should be altered. Correct the program and rerun.
JRPtyInvalidOutBaud
The output baud rate is incorrect.
Action: An incorrect output baud rate was set. The termios structure used in a tcsetattr request should be derived from an earlier tcgetattr request, and the output baud rate should only be set using the cfsetospeed function. Correct the program and rerun.
JRPtyInvalidInBaud
The input baud rate is incorrect.
Action: An incorrect input baud rate was set. The termios structure used in a tosetattr service request should be derived from an earlier togetattr service request, and the input baud rate should be set using only the ofsetispeed service. Correct the program and rerun.
JRPtyBgCall
This is a background process.
Action: The service requested is not allowed from the background. Rerun the program in the foreground.
JRInvIoctlCmd
The input command value is incorrect.
Action: The command is not supported. Correct the program and rerun.
JRPtyNoCntlTerm
The caller has no controlling terminal.
Action: The caller has no controlling terminal. Correct the program or rerun it in an environment where the terminal is the controlling terminal.

Value	Description
019A	JRPtyDiffSession
	This is not the caller's controlling terminal.
	Action: The specified file descriptor is not for the caller's controlling terminal. Correct the program or rerun it in an environment where the file is for the controlling terminal.
019B	JRecoveryInvoked
	Recovery code was invoked.
	Action: See your IBM service representative.
019C	JRPtKillFailed
	The ptrace kill signal failed.
	Action: See your IBM service representative.
019E	JRPtPtrbNotAvail
	The ptrace service cannot complete the request due to synchronization error.
	Action: See your IBM service representative.
019F	JRPtBadEnvironment
	The ptrace request handler environment is not valid.
	Action: See your IBM service representative.
01A0	JRPtEdIsAuthorized
	The ptrace debugged process is running in supervisor state.
	Action: A debugger program issued a ptrace request, but the target process is currently running in supervisor PSW state. Do not issue ptrace requests while a debugged process is running in supervisor state.
01A1	JRPtCsvinfoFailed
	Ptrace received an error from CSVINFO.
	Action: See your IBM service representative.
01A2	JRPtLDBufferTooSmall
	The ptrace loader information request buffer is too small.
	Action: A debugger program tried to read loader information from a debugged process into a supplied buffer, but the buffer was too small to hold all the loader information. Reissue the ptrace request with a larger buffer. The maximum length of the buffer is defined in the BPXYPTRC macro.
01A3	JRPtLDRMODE64LoadMod
	An RMODE64 load module was encountered but some information is missing.
	Action: While using PT_LDINFO to read information from a debugged process, a debugger program detected an RMODE64 module. The resulting buffer will be missing information pertaining to the RMODE64 modules, but is otherwise complete. Run PT_LD64INFO for complete information on all loaded modules.

Value	Description
01A4	JRPtDbrParentEqualsDbd
	The ptrace debugger parent PID is the same as debugged PID.
	Action: A debugger program tried to start a debugging session with its parent process as the target. Debugger programs cannot debug their parent.
01A5	JRPtyNotPGLeader
	The process is not a process group leader.
	Action: The process group ID specified does not represent a process group leader. Correct the program or rerun it in an environment where the process is a process group leader.
01A6	JRPtyNotSubsidiary
	Unsupported function against manager TTY.
	Action: The requested function is not allowed against a manager pseudo-TTY. Correct the program and rerun.
01A7	JRPtyBadQueSel
	The queue selector is not valid.
	Action: The queue selector is not valid. Correct the program and rerun.
01A8	JRPtyNoSessLeader
	The system is unable to locate the session leader.
	Action: In order to perform the requested function, the session leader needed to be located, but the system could not find the session leader. If this problem recurs, contact your system programmer.
01A9	JRNoCTTY
	There is no controlling terminal for this process.
	Action: The open request cannot be processed.
01AA	JRPtyHupclClose
	The subsidiary pseudo-TTY file was previously closed with the termios HUPCL flag set.
	Action: The subsidiary pseudo-TTY file for this device minor number had been previously opened and closed. During the final close of the subsidiary pseudo-TTY file, the termios HUPCL flag was on. This causes any subsequent subsidiary pseudo-TTY file open for this device minor number to be rejected until the pseudo-TTY connection is completely ended (that is, the manager pseudo-TTY file is also closed). If you want to open the subsidiary pseudo-TTY file at this point, the application should clear the HUPCL flag using the tcsetattr service before the last subsidiary pseudo-TTY file close.
01AB	JRFsInUse
	The requested file system is still in use.
	Action: A normal unmount was requested for the file system. There is at least one process still using the file system, so the request to unmount cannot be honored.

Value	Description
01AC	JRPtyInvalidPgid
	The requested process group ID is not valid.
	Action: The process group ID specified is not a valid OpenMVS process group ID. Correct the program and rerun.
01AD	JRPtyNotInSession
	The process group ID (PGID) does not exist in the caller's session.
	Action: The caller's session does not have a process group with the specified process group ID. The process group may have completed without the caller's knowledge. Correct the program and rerun.
01AE	JRBrlmNotActive
	The byte-range lock manager is not active.
	Action: The byte-range lock manager is trying to recycle. Reissue the request after the recycle has completed.
01AF	JRBrlmFileLockRecycling
	File lock is being recycled. Do not use until the file is closed by all users.
	Action: The requested file can no longer be used for byte-range locking. The file cannot be locked until it has been recycled. To recycle the file, close all file descriptors open for this file. After all users have closed this file, it will be recycled. It may be some time before all open file descriptors for this file have been closed.
01B0	JRBrlmBadFileType
	Byte-range locking can be performed only on regular files.
	Action: Reissue the request and specify the file descriptor for a regular file.
01B1	JRBrlmNoReadAccess
	Shared byte-range locks are only for files open for read.
	Action: To set a read lock on a file, it must be opened with read access. Reissue the request and specify a file descriptor that has read access to the file.
01B2	JRBrlmNoWriteAccess
	Exclusive byte-range locks are only for files open for write.
	Action: To set a write lock on a file, it must be opened with write access. Reissue the request and specify a file descriptor that has write access to the file.
01B3	JRBrlmBadL_Type
	A byte-range lock request specified an l_type that is not valid.
	Action: The value specified for l_type must be one of the following, found in BPXYBRLK:
	F_RDLCK to set a read lock
	F_WRLCK to set a write lock
	F_UNLCK to unlock a range

	Description
01B4	JRBrlmInvalidRange
	A byte-range lock extends to before the start of the file.
	Action: The range specified by the l_start, l_whence, and l_len must not extend beyond the beginning of the file. Reissue the request and specify a valid range.
01B5	JRBrlmBadL_Whence
	A byte-range lock request specified an l_whence that is not valid.
	Action: The value specified for l_whence must be one of the following, found in BPXYSEEK:
	• SEEK_SET
	• SEEK_CUR
	• SEEK_END
	For v_lockctl requests, only SEEK_SET is valid.
01B6	JRSecurityInternalError
	Internal error in security product.
	Action: See your IBM service representative.
01B7	JRBrlmRangeNotAvailable
	All or part of requested range is held by another user.
	Action: Issue a set lock with wait request to obtain the requested lock when all current users and waiters have freed it.
01B8	JRBrlmDeadLockDetected
	Waiting on the specified range causes a deadlock.
	Action: To avoid deadlock, release the locks being held before requesting a new range. All users should obtain locks in the same order to maintain a lock hierarchy and to avoid deadlocks.
01B9	JRBrlmSignalPosted
	While the process was waiting for a byte-range lock, a signal was posted.
	Action: Try obtaining the lock again. To prevent signals from interrupting the process, you can set up a signal handler.
01BB	JRPtSigactionFailed
	Ptrace sigaction failed.
	Action: See your IBM service representative.
01BC	JRPtSigprocmaskFailed
	Ptrace sigprocmask failed.
	Action: See your IBM service representative.
01BD	JRBrlmBadL_Len
	A byte-range lock request specified an incorrect l_len.
	Action: The l_len value cannot be less than zero. Reissue the request and specify an l_len that is greater than or equal to zero.

Value	Description
01BF	JRReadUserStorageFailed
	A read error occurred on the user data area passed to the service.
	Action: The user data area passed was not addressable. Verify that the address passed was valid and reissue the request.
01C0	JRWriteUserStorageFailed
	A write error occurred on the user data area passed to the service.
	Action: The user data area passed was not addressable. Verify that the address passed was valid and reissue the request.
01C2	JRBrlmAlreadyWaiting
	Request includes a range already being waited on.
	Action: The process is already waiting for a byte-range lock that intersects with the requested range. Wait until the first request is honored before issuing another.
01C3	JRBrlmPromotePending
	Another user is waiting to promote the requested range.
	Action: Another user has already requested promotion of the requested range. That promotion will not be granted until all other users unlock their shared locks on that range. Unlock the range in conflict and issue a set-lock-wait request for the exclusive lock desired.
01C4	JRPtyNoPtyrStorage
	There is not enough storage in the kernel address space.
	Action: This should be a transient condition. Reissue the service. If the problem persists, contact the system programmer or system administrator to diagnose the storage usage in the kernel address space.
01C5	JRBrlmProcessBroken
	This process has been marked broken for byte locking.
	Action: The process cannot issue byte-range locking requests any more.
01C6	JRPtyConnectionInop
	The pseudo-TTY connection is inoperative.
	Action: An internal error occurred, causing this pseudo-TTY connection to be marked as inoperative. To clear this error condition, all file descriptors associated with this device minor number must be closed.
01C8	JRDtuErr
	An error occurred during process signal initialization.
	Action: See your IBM service representative.
01C9	JRBrlmUnlockWhileWait
	The unlock service is not valid while the process is waiting for an intersecting lock.
	Action: The process is presently waiting for a lock. No unlock requests will be accepted for a range that intersects with the range being waited for.

Value	Description
01CA	JRBrlmObjAndProcBroken
	The object and process are marked broken for byte locking.
	Action: The process can no longer issue byte-range locking requests.
01CB	JROutOfCells
	Out of nonexpandable cell pool cells.
	Action: See your IBM service representative.
01CC	JRBadTree
	The session or group tree is broken.
	Action: See your IBM service representative.
01CD	JRFd2TooSmall
	The second file descriptor cannot be smaller than the first.
	Action: The specified request requires that the second file descriptor be greater than or equal to the first file descriptor.
01CE	JRPtCreateError
	An unexpected error occurred in the BPX1PTC service.
	Action: See your IBM service representative.
01CF	JRNotAuthorized
	Unauthorized caller of BPX1PTC in an authorized environment.
	Action: The invoker of BPX1PTC is a problem state, key 8, non-job step authorized caller. The current environment requires the caller to be either supervisor state, key 0&ndash.7, or job-step authorized. Reissue the BPX1PTC callable service with the correct authorization.
01D0	JRPtExitError
	An unexpected error occurred in the BPXPTEXT service.
	Action: See your IBM service representative.
01D1	JRPtCancelError
	An unexpected error occurred in the BPX1PTB service.
	Action: See your IBM service representative.
01D2	JRPtDetachError
	An unexpected error occurred in the BPX1PTD service.
	Action: See your IBM service representative.
01D3	JRPtatEye
	The pthread attribute area contains an incorrect eyecatcher.
	Action: The eyecatcher value must be BPXYPTAT. Reissue the BPX1PTC callable service with the corrected eyecatcher value.

Value	Description
01D4	JRPtatAddrError
	The pthread attribute area address is incorrect.
	Action: Reissue the call to the BPX1PTC service with a pthread attribute area address that is accessible to the caller of BPX1PTC.
01D5	JRPTCNotSupp
	BPX1PTC is not supported from the calling task.
	Action: The BPX1PTC callable service can be issued only from the task that first invoked BPX1PTC within the process or from any of its daughter tasks. Reissue the BPX1PTC callable service from a task that can support the invocation.
01D6	JRAllFilesNotClosed
	All requested files were not closed.
	Action: Some of the file descriptors within the specified range remain open. Use closedir to close any directory file descriptors. Any other file descriptors that remain open may have been opened while the process was executing in an authorized state, and the process may no longer be authorized to use them.
01D7	JRExitRtnError
	An error occurred in the user exit called by the exec.
	Action: An error occurred after the BPX1EXC or BPX1EXM callable service passed control to the exit routine location specified by the caller. There are two probable causes for this error:
	<ul> <li>The location specified for the user exit routine was incorrect</li> </ul>
	<ul> <li>A program check occurred while the user exit routine was in control</li> </ul>
	Verify the location of the user exit routine and that the routine does not cause a program check to occur.
01D8	JRThreadTerm
	The service was rejected because the requesting thread is terminating.
	Action: The BPX1PTX callable service should be issued to complete the termination of the thread and to obtain a new thread to process. Other OpenMVS callable services are not supported while a thread is in this state.
01DA	JRLightWeightThid
	The thread specified is a lightweight thread.
	Action: The thread specified by the caller is for a lightweight thread. Lightweight threads are not managed by OpenMVS.
01DB	JRAlreadyDetached
	The thread specified is already detached.
	Action: The thread specified by the caller is already detached. The requested service cannot be performed on a detached thread.
01DC	JRThreadNotFound
	The thread specified was not found.
	Action: The thread specified by the caller is not a thread in the current process.

Value	Description
01DE	JRHeavyWeight
	The new thread was not started and the existing thread is a heavyweight thread.
	Action: The existing task is a heavyweight thread and cannot be reused via the PTGetNewThread option.
01DF	JRGetFirst
	The first call did not specify PTGetNewThread.
	Action: The first call to this service from a newly created thread must specify the PTGetNewThread option.
01E0	JRAlreadyJoined
	The thread specified was already joined by another thread.
	Action: The thread specified by the caller of the pthread_join service is currently joined by another thread. The target thread of a pthread_join can be joined by only one thread at a time.
01E1	JRPTJoinError
	An error occurred in the BPX1PTJ service.
	Action: See your IBM service representative.
01E2	JRJoinExitStatPtr
	The address of the exit status parameter is not correct.
	Action: An error occurred while the thread exit status was being copied to the location specified by the caller of the pthread_join service. Check the exit status location specified by the caller of the pthread_join service for an incorrect location.
01E3	JRJoinToSelf
	The thread attempted to join to itself.
	Action: The thread specified by the caller and the thread calling the pthread_join service are the same. A thread is not allowed to join to itself.
01E4	JRJoinLoop
	The connection would result in thread waiting for itself.
	Action: The thread specified by the caller of the pthread_join service would create a loop of joined threads. A thread is not allowed to join any thread or chain of joined threads that would result in a loop back to itself.
01E5	JRJoinIPTExited
	The thread attempted to connect to IPT after IPT had already exited.
	Action: See your IBM service representative.
01E6	JRJoinAsyncNoFreeTasks
	The connection ended with an asynchronous thread and no tasks available.
	Action: See your IBM service representative.

Value	Description
01E7	JRAlreadyPtexited
	The calling thread has already been exited through a call to the BPX1PTX service.
	Action: The calling thread is now in a terminated state; the calling program should return to the operating system to allow the task to be terminated.
01E8	JRAlreadyTerminated
	The thread specified has already ended.
	Action: The thread specified by the caller of the pthread_cancel service has already been canceled or exited and is in the process of being ended.
01E9	JRCallRtmErr
	The CALLRTM macro returned a return code with an error.
	Action: See your IBM service representative.
01EA	JRBrokenBrlmRecycling
	The byte-range-lock manager is broken and is currently recycling.
	Action: The byte-range-lock manager is trying to recycle. Reissue the request when the recycle has completed.
01EB	JRPtatSysOff
	The system offset value in the pthread attribute area is incorrect.
	Action: The system offset value must be set to the value provided with the BPXYPTAT mapping, PTATSYSOFFVAL. Reissue the BPX1PTC callable service with the corrected system offset value.
01EC	JRPtatSysLen
	The system length value in the pthread attribute area is incorrect.
	Action: The system length value must be set to the value provided with the BPXYPTAT mapping, PTATSYSLENVAL. Reissue the BPX1PTC callable service with the corrected system length value.
01ED	JRPtatLen
	The total length value in the pthread attribute area is incorrect.
	Action: The total length value must be set to the sum of PTAT#LENGTH and PTATUSERLENGTH. Use the BPXYPTAT mapping to correct this error. Reissue the BPX1PTC callable service with the corrected total length value.
01EE	JRRMGWrongDataLen
	Resource data area length is not correct for this release.
	Action: The Data_Area_Length field passed to the resource callable service does not match the length of the storage area to be returned. To avoid misinterpretation of returned data, the service fails. The Data_Area_Length field could be incorrect because of a coding error. Or, the length value required may have changed when your installation migrated to a new release. Correct the value and recompile your program.

Value	Description
01EF	JRInvOption
	Incorrect option specified on call to BPX1PTX.
	Action: The option specified is either not a supported option or is a supported option that was specified in an unsupported environment. Examples of the latter error are:
	<ul> <li>The PTGETNEWTHREAD option is specified from a thread that was not created through the BPX1PTC callable service. The PTEXITTHREAD option is supported only from this type of thread.</li> </ul>
	<ul> <li>The PTEXITTHREAD option is specified on the first invocation of BPX1PTX from the thread initialization routine. The first invocation of BPX1PTX must specify the PTGETNEWTHREAD option to obtain the first thread to process.</li> </ul>
	Reissue the BPX1PTX callable service with the corrected option value.
01F0	JRInitRtn
	The initialization routine is not valid for the current environment.
	Action: The initialization routine address specified on the BPX1PTC invocation does not match the initialization routine address supported in the current environment. The initial call to BPX1PTC within the current process image specified a different address. Only one initialization routine is supported for a given process image. Reissue the BPX1PTC callable service with the initialization routine address that is supported in the current process image.
01F1	JRPtatWeight
	The pthread attribute area contains an incorrect weight value.
	Action: The pthread weight attribute value must be set to PTATHEAVY or PTATMEDIUM. Use the BPXYPTAT mapping for the definition of this value. Reissue the BPX1PTC callable service with the corrected pthread weight attribute value.
01F2	JRPtatSyncType
	The pthread attribute area contains an incorrect Sync Type value.
	Action: The pthread sync type attribute value must be set to PTATSYNCHRONOUS. Use the BPXYPTAT mapping for the definition of this value. Reissue the BPX1PTC callable service with the corrected pthread sync type attribute value.
01F3	JRPtatDetachState
	The pthread attribute area contains an incorrect detach state value.
	Action: The pthread detach state attribute value must be set to PTATUNDETACHED or PTATDETACHED. Use the BPXYPTAT mapping for the definition of these values. Reissue the BPX1PTC callable service with the corrected pthread detach state attribute value.
01F4	JRNoSuchPid
	The process ID is incorrect.
	Action: Choose a process ID that is valid.
01F5	JRPidEQSessLeader
	The process ID is a session leader.
	Action: Choose a process ID that is not a session group leader.

Value	Description
01F6	JRTooMany
	The event list specified contained more than one event.
	Action: The event list specified for the BPX1CPO callable service contained more than one event. Reissue the BPX1CPO callable service with an event list that contains only one event.
01F7	JRPidDifferentSession
	The process ID is in a session different from the caller.
	Action: Choose a process ID that is in the same session as the caller.
01F8	JRExecAfterFork
	The process ID was called by the exec service after the fork service.
	Action: Choose a process ID that does not belong to a process that has been started with exec after a fork.
01F9	JRTimeOutNotAuth
	The caller to BPX1CPO service specified the CW_TIMEOUT event but is not authorized.
	Action: The caller of the BPX1CPO service specified the CW_TIMEOUT event but is not authorized. To specify the CW_TIMEOUT event, the caller must be authorized. Reissue the BPX1CPO service call with another valid event.
01FA	JRNotDescendant
	The process ID is not an immediate descendant of the caller.
	Action: Choose a process ID that is an immediate descendant of the caller (that is, a child, but not the child of a child).
01FB	JRPgidDifferentSession
	Process group ID is in a session different from the caller.
	Action: Choose a process ID that is in the same session as the caller.
01FC	JRCallerIsPgLeader
	The caller is already a process group leader.
	Action: Choose a process ID that is not already a process group leader.
01FD	JRNullMask
	The caller specified a null signal mask.
	Action: At least one valid signal must be specified in the signal mask.
01FE	JRRdlBuffLenInvalid
	The length of the buffer is less than zero.
	Action: The readlink service requires that the specified buffer length be greater than or equal to zero.
0200	JRPswKeyNotValid
	The PSW key of the caller is not a valid key.
	Action: A service was requested that requires the invoker to be in the same key that the process was dubbed under.

Value	Description
0201	JRAlreadySigSetUp
	BPX1MSS found the process already set up for signals.
	Action: Only one task can be set up for signals at any one time. Issue the signal unset (BPX1MSD) service on the task that did the last setup and then reissue this service.
0202	JRNotSigSetUp
	The service found the current task was not set up for signals.
	Action: Issue the signal setup service BPX1MSS and then reissue this service.
0203	JREndingSlashSymlink
	The pathname ended with slash on the symlink service.
	Action: The linkname specified on a symlink request contained a trailing slash. Reissue the request and omit the trailing slash.
0204	JRUndefEvents
	The specified event list contains undefined events.
	Action: Only specify events defined in BPXYCW for the BPX1CSE, BPX1CWA, or BPX1CTW callable services. For the BPX1CPO service, the only event allowed is CW_CONDVAR.
0205	JRNoEvents
	The specified event list is zero.
	Action: Specify one or more events defined in BPXYCW for the BPX1CSE, BPX1CWA, or BPX1CTW callable services. For the BPX1CPO service, specify the CW_CONDVAR event.
0206	JRIPTCannotLeave
	The caller has daughter tasks. Termination is denied.
	Action: Terminate with BPX1EXI. Calls to BPX1MPC will be denied.
0207	JRNotSetup
	The thread is not set up for cond_wait or cond_timed_wait.
	Action: Specify one or more events defined in BPXYCW for the BPX1CWA or BPX1CTW callable services, or use the BPX1CSE callable service prior to BPX1CWA or BPX1CTW.
0208	JRAlreadySetup
	The thread is already set up for cond_setup, cond_wait, or cond_timed_wait.
	Action: Use the BPX1CCA callable service to cancel a condition wait before setting up for a new condition wait.
0209	JROutOfRange
	The value specified for a parameter is outside the allowable range.
	Action: Compare the argument values you specified to the documented limits to find which ones are unacceptable.

Value	Description
0210	JRNanoSecondsTooBig
	The value specified for nanoseconds is outside the allowable range.
	Action: Change the value specified for nanoseconds to be less than 1 000 000 000 (1000 million).
0211	JRTimeOut
	The time for the service to wait has expired.
	Action: While the process was waiting for signals or a condition to occur, the wait time specified expired.
0212	JRDup2Error
	A problem occurred with the requested file descriptor.
	Action: Try the request again.
0213	JRAccept
	Vnode operation accept is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0214	JRBind
	Vnode operation bind is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0215	JRConnect
	Vnode operation connect is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0216	JRGetHost
	Vnode operation gethost is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0217	JRGetName
	Vnode operation getname is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0218	JRSockOpt
	Vnode operation sockopt is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.

Value	Description
0219	JRListen
	Vnode operation listen is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
021A	JRReadWriteV
	Vnode operation readwritev is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
021B	JRSndRcv
	Vnode operation sndrcv is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
021C	JRSndToRcvFm
	Vnode operation sndtorcvfm is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
021D	JRSrMsg
	Vnode operation srmsg is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
021E	JRSelect
	Vnode operation select is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
021F	JRSetPeer
	Vnode operation setpeer is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0220	JRShutdown
	Vnode operation shutdown is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0221	JRSocket
	VFS operation socket is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.

Value	Description
0222	JRNoSocket
	The requested operation cannot be performed on a socket file descriptor.
	Action: Specify a file descriptor that does not refer to a socket
0223	JRMustBeSocket
	The requested operation is only valid on a socket file descriptor.
	Action: Specify a file descriptor that refers to a socket.
0224	JRTargetEnding
	The target process is ending.
	Action: setpgid is not permitted because the target process is a zombie (terminating).
0225	JRQuiesceTypeInvalid
	The quiescetype specified by the caller is invalid.
	Action: Reissue the quiesce_threads service with the corrected quiescetype.
0226	JRQuiesceInProgress
	Another thread in the process has already requested quiescing of all threads.
	Action: See your IBM service representative.
0227	JRLastThread
	The last pthread is exiting when the PTFAILIFLASTTHREAD option is specified.
	Action: Reissue the BPX1PTX call without this option to cause the thread to be exited.
0228	JRDomainNotSupported
	The requested domain is not supported.
	Action: The domain specified does not exist. Specify an existing domain.
0229	JRNetwork
	Vfs operation network is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
022A	JROutofVdeCells
	All Vde cells have been allocated.
	Action: Try again after releasing any unused vnode tokens.
022B	JRTokenMax
	The maximum number of Vnode tokens have been allocated for this process.
	Action: Specify a larger maximum number of vnode tokens on the next server registration.
022C	JRVTokenFreed
	The Vnode token has already been released.
	Action: Ensure that the correct Vnode token is supplied.

Value	Description
022D	JRWrongPID
	The process does not own this Vde.
	Action: Ensure that the correct Vnode token is supplied.
022E	JRStaleVnodeTok
	The Vnode token is stale.
	Action: Ensure that the correct Vnode token is supplied.
022F	JRInvalidVnodeTok
	The Vnode token does not point to a Vde.
	Action: Ensure that the correct Vnode token is supplied.
0230	JRNotRegisteredServer
	The process is not a registered server.
	Action: Issue a v_reg request to register as a server and issue the request again.
0231	JRInvalidRegType
	The server type supplied in NRegSType is not valid.
	Action: Ensure that the value provided in NRegSType is correct.
0232	JRNameTooLong
	The name supplied is longer than the allowed maximum.
	Action: Correct the length value supplied and reissue the request.
0233	JRAlreadyRegistered
	The process is already registered as a server.
	Action: There is no need to issue the v_reg service. The Vnode interface services are already available to this process.
0234	JRInvalidNReg
	An incorrect NReg parameter list was passed.
	Action: Ensure that the values provided in NRegID and NRegLen are correct.
0235	JRNoLeadingSlash
	The pathname does not begin with /.
	Action: Ensure that the pathname parameter supplied on the request is an absolute pathname.
0236	JRStaleVfsTok
	The VFS token is stale.
	Action: Obtain a new VFS token via v_rpn.
0237	JRSmallAttr
	The Attr length parameter was too small.
	Action: Ensure that the Attr parameter points to a structure of length Attr#Len and the AttrLen parameter supplies this length.

Value	Description
0238	JRSmallMnte
	The Mnte length parameter was too small.
	Action: Ensure that the Mnte parameter points to a structure large enough to contain an MnteH and one Mnte. Also ensure that the MnteLength parameter supplies this length.
0239	JRRwNotRegFile
	The rdwr call is valid only on a regular file.
	Action: In order to be able to read or write a file, you must specify the Vnode Token for a file, not for a directory or a FIFO.
0240	JRDubSetting
	The dub setting value specified on the BPX1SDD service call is not correct.
	Action: The dub setting value must be set to DUBTHREAD or DUBPROCESS. Use the BPXYCONS macro for the definition of these values. Reissue the BPX1SDD callable service with the corrected dub setting value.
0241	JRInvalidAtt
	The Attribute structure passed to BPX1CHR or BPX1FCR was not valid.
	Action: The length passed must be equal to the current version, and the ATTID and ATTVERSION must be initialized to the constants defined in BPXYATT.
0242	JRInvalidOSS
	The OSS is not valid.
	Action: Correct the OSS and call the service again.
0243	JRSmallFSAttr
	The FSAttr length parameter was too small.
	Action: Ensure that the FSAttr parameter points to a structure of length SSTF#Len and the FSAttrLen parameter supplies this length.
0244	JRAPFAuthChange
	A local process exec or a local spawn, running in an authorized state attempted to load and execute an unauthorized program.
	Action: An Attach_exec or local spawn was attempted which would allow an unauthorized program to be executed from an APF authorized address space. This is not permitted since it would allow an unauthorized program to run in an authorized state.
0245	JRIDChange
	A local process exec tried to change the UID / GID.
	Action: An Attach_exec was attempted which would change the UID / GID authorization of the address space. This is not permitted.

Value	Description
0246	JROtherProcesses
	An exec was attempted that would terminate the other processes in the address space.
	Action: An exec is not permitted in an address space that contains multiple processes.
0247	JRPtRequestDenied
	The ptrace request is not allowed for the current debugged program environment.
	Action: A debugger program issued a ptrace request that is not allowed at the present time, due to the current environment in which the debugged program is running.
0248	JRInvalidFUio
	An incorrect FUio area was passed.
	Action: Ensure that the values provided in FUioID and FUioLen are correct and that valid options are specified.
0249	JRTokDir
	The VNODE token specifies a directory.
	Action: The service requested is not applicable to a directory; the VNODE token passed was for a directory.
024A	JRTokNotDir
	The VNODE token does not specify a directory.
	Action: The service requested requires a directory, but the VNODE token passed is not for a directory.
024B	JRInvalidAttr
	The supplied Attribute structure was not valid.
	Action: Ensure that the values provided in AttrID and AttrLen are correct.
024C	JRMaxTasks
	• The number of tasks in the process is greater than the maximum allowable limit.
	<ul> <li>For a pthread_exit_and_get (BPX1PTX) call, the pthread is ended because there are already 10 medium-weight pthreads waiting for work.</li> </ul>
	Action:
	<ul> <li>Retry after some threads have ended, or change the maximum allowable limit using the BPX1STL service.</li> </ul>
	<ul> <li>For a pthread_exit_and_get call, if the pthread must remain active, see z/OS UNIX         System Services Programming: Assembler Callable Services Reference for information         about managing pthreads.</li> </ul>

Value	Description
024D	JRMaxSockets
	The number of active sockets is equal to the value specified on the MAXSOCKETS parmlib statement.
	Action: Retry after some sockets have closed. For AF_INET or AF_INET6 domain sockets, you can change the MAXSOCKETS value dynamically using the SETOMVS RESET= or SET OMVS= system command. For AF_UNIX domain sockets change the MAXSOCKETS value in parmlib and re-ipl.
024E	JROutofLatches
	All latches in the socket latch set pool are assigned to Snodes.
	Action: See your IBM service representative.
024F	JROutofSocketCells
	The system was unable to obtain a cell from the sockets cell pool.
	Action: See your IBM service representative.
0250	JRNotDir
	The name does not specify a directory.
	Action: The service requested requires a directory, but the name specified is not for a directory.
0251	JROutofSocketsNodeCells
	The system was unable to obtain a cell from the sockets node cell pool.
	Action: See your IBM service representative.
0252	JRExternalLink
	An external symbolic link was found but is not supported.
	Action: Do not specify the name of an external symbolic link.
0253	JRSocketNotFound
	The requested socket was not found, or is not active.
	Action: See your IBM service representative.
0254	JRSocketNamed
	A Bind request was received for a socket that was previously named.
	Action: Do not specify Bind for a named socket.
0255	JRInvalidCallingState
	The caller is not supervisor state and key 0.
	Action: See your IBM service representative.
0256	JRPidIsCaller
	Pid specifies the PID for the calling process.
	Action: See your IBM service representative.

Value	Description
0257	JRPidNoLatch
	Unable to obtain latch for PID.
	Action: See your IBM service representative.
0258	JROutofSocketDataCells
	The system was unable to obtain a cell from the sockets data buffer cell pool.
	Action: See your IBM service representative.
0259	JRSocaNwkBitOn
	Duplicate NETWORK parmlib statements exist.
	Action: Remove the duplicate NETWORK statements from the parmlib member and re-ipl.
025A	JRISGLCRTFailed
	Latch set service ISGLCRT failed.
	Action: See your IBM service representative.
025B	JRListenNotAccepted
	A listen syscall was issued for a socket that has not been bound, for a socket that is already a server, or for a socket that is already connected.
	Action: Verify that the application program issues the listen at the proper time.
025C	JRSocketClosed
	An attempt was made to read, write or connect to a socket that is closed.
	Action: Try the request again to a UNIX domain socket that is not closed.
025D	JRTooManyThds
	An attempt was made to create another thread but the process limit for pthreads has already been reached.
	Action: Try the request again after some threads have been exited and detached or increase the process thread limit.
025E	JRSocketCallParmError
	A socket syscall contains incorrect parameters.
	Action: Check the parameters and ensure the request is valid for the specified socket.
025F	JRRecovery
	The recovery VFS operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0260	JRInvalidRoutine
	An incorrect routine address was passed.
	Action: Reissue the BPX1IPT service and specify a nonzero routine address.

Value	Description
0261	JRRoutineError
	An error occurred while the user-provided routine was in control.
	Action: Refer to provided diagnostic information (user SYSxDUMP) to resolve the problem.
0262	JRNoLists
	A Select request was issued without a read, write or exception list.
	Action: Reissue the request and specify at least one list of file descriptors to be checked.
0263	JRListTooLong
	The read, write or exception list is too long.
	Action: Reissue the request and specify a read, write, or exception list that is 8192 bytes or less.
0264	JRListTooShort
	The read, write or exception list is too short to contain the specified number of file descriptors and message queue identifiers.
	Action: Reissue the request and specify a read, write, or exception list that is large enough to contain the specified number of file descriptors and message queue identifiers.
0265	JRMSOutOfRange
	The value specified for microseconds is outside the allowable range.
	Action: Reissue the request and specify a value for microseconds in the range 0 to 1 000 000 (1 second) inclusive.
0266	JRSecOutOfRange
	The value specified for seconds is outside the allowable range.
	Action: Reissue the request specifying a value for seconds in the range 0 to 2 678 400 (31 days) inclusive.
0267	JRNoFds
	The read, write or exception list did not contain any file descriptors, or the Number_FDs parameter was not greater than 0.
	Action: Reissue the request specifying at least one file descriptor in the read, write or exception list, and make sure the Number_FDs parameter contains the highest specified FD.
0268	JRPtQuiesceFailed
	Ptrace quiesce failed.
	Action: See your IBM service representative.
0269	JRIncorrectSocketType
	The socket type is incorrect for the request.
	Action: Reissue the request and specify a socket descriptor that refers to a socket of the correct type.

Value	Description
026A	JRWouldBlock
	The O_NONBLOCK flag is set and this request would block.
	Action: Reissue the request later.
026B	JRExceedsBackLogCount
	This connect request exceeds the connect backlog count that was specified on the Listen request.
	Action: Reissue the request later.
026C	JRLevelNotSupp
	The value specified for Level is not supported by the physical file system.
	Action: Reissue the request and specify a value for Level that corresponds to manipulation at the Socket Level.
026D	JRSetNotSupp
	The UNIX Domain Socket File System does not support the setting of socket options.
	Action: See your IBM service representative.
026E	JRInvOpOpt
	The Option name specified is not valid.
	Action: Reissue the request and specify a valid socket option.
026F	JRBuff
	The buffer for return information is too small.
	Action: The length of the buffer specified on the service was not large enough to contain the data to be returned.
0270	JROptNotSupp
	The Option name specified is not supported.
	Action: Correct the error depending on the request:
	<ul> <li>Reissue the request and specify a supported socket option.</li> </ul>
	<ul> <li>Reissue the request and specify a supported mmap or mprotect option.</li> </ul>
	<ul> <li>Reissue the request and specify a supported osenv option.</li> </ul>
0271	JRPtAsyncThread
	The ptrace request is not allowed because the target thread is asynchronous.
	Action: A debugger program issued a ptrace request for a target thread that is in an asynchronous state.
0272	JRSocketNotCon
	The requested socket is not connected.
	Action: Reissue the request after a successful connect request has completed. This value is also returned if an asynchronous connect is in progress.

Value	Description
0273	JRPtyNoPtysStorage
	There is insufficient storage in the kernel address space.
	Action: This should be a transient condition. Reissue the service. If the problem persists, contact the system programmer or system administrator to diagnose the storage usage in the kernel address space.
0274	JRUnknownKPRC
	Kernpost returned an invalid return code.
	Action: See your IBM service representative.
0275	JRSockRdwrSignal
	Signal interrupt during socket read or write processing.
	Action: Close the socket. The other end of the socket has been closed and is no longer being read or written.
0276	JRSockBufMax
	There is insufficient storage for the socket message.
	Action: Break the message into two or more smaller parts.
0277	JRInvalidMsgH
	The socket message header is not correct.
	Action: Correct the message header.
0278	JRSockNoName
	The request requires a socket name structure.
	Action: Specify a socket name.
0279	JRInvalidServerNameLen
	The server name length supplied in NRegSNameLen is too long or negative.
	Action: Correct the value supplied in NRegSNameLen and issue the request again.
027A	JRNoOOBDataAvail
	The MSG_OOB flag is set but no OOB data is available or OOB data is inline.
	Action: Reissue the request with the MSG_OOB flag not set.
027B	JRIncorrectTypeForFlag
	MSG_OOB flag is set but socket is not a stream socket.
	Action: Reissue the request with the MSG_OOB flag not set.
027C	JRSockShutDown
	Socket has been shut down.
	Action: Request cannot complete on this socket.
027D	JRMSGHInvalid
	msg_controllen or a cmsg_len has an incorrect length.
	Action: Supply valid msg_controllen and cmsg_len values.

Value	Description
027E	JRNoAddrSpace
	The caller's address space name cannot be determined.
	Action: The request cannot complete.
0280	JRNoName
	The name length is zero.
	Action: Supply a positive value for the name length.
0281	JRListLenBad
	The length of one or all of the input bit lists is not a multiple of four or is not more than 256 bytes.
	Action: Reissue the request specifying list lengths that are a multiple of four. If the request specified both file descriptors and message queues, make sure list lengths are also more than 256 bytes long.
0282	JrInvUserOp
	The value specified for the User Option was not 0 or 1.
	Action: Reissue the request and specify 0 or 1.
0283	JRSocketProtocolInvalid
	The protocol argument on the socket or socketpair syscall was not 0. The physical file system only supports a value of 0 for the protocol.
	Action: Reissue the request and specify 0 for the protocol argument.
0284	JRSteplibAllocateBad
	Dynamic allocation failed for a data set while attempting to build the STEPLIB concatenation.
	Action: See your IBM service representative.
0285	JRSteplibConcatBad
	Dynamic concatenation failed while attempting to build the STEPLIB concatenation.
	Action: See your IBM service representative.
0286	JRSteplibOpenBad
	Open of the steplib dd failed while attempting to build the STEPLIB concatenation.
	Action: See your IBM service representative.
0287	JRSteplibDcbObtainBad
	Storage could not be obtained for the STEPLIB dcb while attempting to build the STEPLIB concatenation.
	Action: See your IBM service representative.
0288	JRNameExists
	The name specified in the request is already in use.
	Action: Check the name; if correct, then unlink the name and retry.

Value	Description
0289	JRListenNotDone
	The socket is not ready to accept connections.
	Action: Issue a listen request and then reissue the accept request.
028A	JRSteplibDSORGBad
	A nonpartitioned data set was specified in the STEPLIB concatenation.
	Action: See your IBM service representative.
028B	JRSteplibTooBig
	More than 255 data sets were specified in the STEPLIB concatenation.
	Action: See your IBM service representative.
028C	JRListenNotStream
	A listen syscall was issued for a socket that is not a stream socket. Listen is only valid for stream sockets.
	Action: Correct the application program.
028D	JRListenAlreadyDone
	A listen request has already been completed.
	Action: Issue an accept request to begin accepting connections.
028E	JRSTLActionInvalid
	The value specified for the action parameter is not valid.
	Action: Specify a valid action and retry.
028F	JRSTLTasksInvalid
	The value specified for the task limit is not valid.
	Action: Specify a task limit within the allowable ranges and retry the operation.
0290	JRSTLThreadsInvalid
	The value specified for the thread limit is not valid.
	Action: Specify a thread limit with the allowable ranges and retry the operation.
0291	JrTcpError
	Tcp returned an error identified by the return code.
	Action: Correct the error reported by the return code.
0292	JRNoSpace
	Pthread_create failed, due to unavailable user address space storage.
	Action: Reduce the amount of user address space storage consumed and retry the operation.
0293	JRMaxTcpPathIds
	The maximum number of Tcp/IP path IDs has been exceeded.
	Action: Contact your IBM service representative.

Value	Description
0294	JRPtNotXtdEvent
	The ptrace request is not allowed because the target process is not stopped for an extended event.
	Action: A debugger program issued a ptrace request that requires the target process to be stopped for an extended event, but the process is not stopped.
0295	JRPtTooManyEvents
	The ptrace PT_EVENTS request attempted to add more events than the specified maximum.
	Action: A debugger program issued a ptrace PT_EVENTS request to add a new extended event ID. Adding the event would exceed the maximum number of events specified on the request.
0296	JrTcpNotActive
	No AF_INET socket provider is active.
	Action: Start the AF_INET socket provider you specified in parmlib and retry this socket request.
0297	JRMaxInetSockets
	The number of active INET sockets is equal to the value specified on the MAXSOCKETS parmlib statement.
	Action: Retry after some sockets have closed, or change the MAXSOCKETS value in parmlib, and re-IPL.
0298	JRECBerror
	The last ECB pointer in the list of ECB pointers does not have the high order bit ('80000000'x) set on to indicate that it is the last ECB pointer in the list.
	Action: Probable user programming error. Ensure that the service was called with the correct number of ECB pointers and that the last ECB pointer has the high order bit set on.
0299	JRECBListBad
	An error occurred accessing the list of pointers to ECBs on a call to the MVSpauseInit service.
	Action: Ensure that the ECB list is accessible in the caller's key and storage has been obtained for the ECB list.
029A	JRECBstateBad
	An error occurred accessing one or more of the input ECBs on a call to the MVSpauseInit or MVSpause service.
	Action: Ensure that the ECBs are accessible in the caller's key and storage has been obtained for the ECBs.
029B	JRECBListNotSetup
	The MVSpause service was called but the MVSpauseInit service was never called to prepare for an MVSpause.
	Action: Invoke the MVSpauseInit service to prepare for an MVSpause operation. Once MVSpauseInit completes successfully, the MVSpause service can be invoked.

Value	Description
029C	JRSocketTypeNotSupported
	The requested socket type is not supported.
	Action: The error could be one of the following:
	<ul> <li>The address family specified on the sendmsg or sendto request was different from that specified when the socket was created.</li> </ul>
	<ul> <li>For AF_UNIX sockets, only stream or datagram sockets are supported - some other type was requested on the socket request.</li> </ul>
	<ul> <li>For AF_INET sockets, only stream, datagram and raw sockets are supported - some other type was requested on the socket request.</li> </ul>
029D	JREcbWaitBitOn
	The wait bit (the high order bit) was on in the specified event control block (ECB).
	Action: Initialize the ECB to zero, then reissue the request.
029E	JRInvalidVlok
	The supplied VLock structure was not valid.
	Action: Ensure that the values provided in the VLock structure are correct. One of the following problems was detected: (1) The Vlock structure is too short. (2) The Vlock length field does not equal its length parameter. (3) The Vlock Id field does not equal 'VLOK'. (4) For Purge with purge masks specified, the purge mask length field was too short. (5) For UnLoadLocks from an unauthorized caller, the subpool specified was not between 1 and 127. (6) An output blocking lock is requested but the corresponding blocking lock length field value is too small. (7) A Vnode token was passed but it does not match the object specified in the Vlok.
029F	JRInvalidServerPID
	The supplied VLokServerPID value was not valid.
	Action: Ensure that the value provided in the VlokServerPID field is a valid process ID.
02A0	JRNoLockerToken
	No Locker token was specified in the Vlock structure.
	Action: Ensure that the value provided in the VlokLockerTok field is the value returned when the Locker was registered.
02A1	JRBrlmObjectMissing
	No Object was specified in the Vlock structure.
	Action: Ensure that a value is provided in the VlokObject field on v_lockctl requests.
02A2	JRBrlmWrongLevel
	The byte-range lock manager does not support the request.
	Action: Ensure that the installed byte-range lock manager supports v_lockctl requests.

Value	Description
02A3	JRBrlmLockerNotRegistered
	The Locker token specified in the Vlock structure is not registered.
	Action: Register the Locker ServerPID and ClientPID with v_lockctl RegLocker and use the returned LockerTok on subsequent v_lockctl requests.
02A4	JRMultiProc
	The specified function is not supported in an address space running multiple processes.
	Action: Do not call the specified function from address spaces running multiple processes.
02A5	JRTaskAcee
	The specified function is not supported when a task level ACEE is active for the calling task.
	Action: Do not call the specified function from a task that has a task level ACEE active.
02A6	JRUserNameLenError
	The user name length value was incorrect.
	Action: Ensure that the user name length is between 1 and 8.
02A7	JRPasswordLenError
	The pass length value was incorrect.
	Action: Ensure that the pass length is between 1 and 8 for passwords and passtickets and between 9 and 100 for password phrases.
02A8	JRNewPasswordLenError
	The new pass length value was incorrect.
	Action: Ensure that the new pass length is between 1 and 8 for passwords and between 9 and 100 for password phrases.
02A9	JRMixedSecurityEnv
	The specified function is not supported after a seteuid has changed the security environment of the caller.
	Action: Do not call the specified function from a process that has issued a seteuid to change the security environment.
02AA	JRQuiesceTerm
	A pthread_quiesce(term) is already in progress on another thread in the caller's process.
	Action: See your IBM service representative.
02AB	JRQuiesceForce
	A pthread_quiesce(force) is already in progress on another thread in the caller's process.
	Action: See your IBM service representative.

Value	Description
02AC	JRQuiesceFreeze
	Action: See your IBM service representative.
02AD	JRQuiesceFreezeForce
	A pthread_quiesce(freeze_force) is already in progress on another thread in the caller's process.
	Action: See your IBM service representative.
02AE	JRTso
	The specified function is not supported in a TSO space running multiple processes.
	Action: Do not call the function in question from address spaces running multiple processes.
02AF	JREnvDirty
	The specified function is not supported in an address space where a load was done that is not program controlled.
	Action: Make sure that programs being loaded into this address space are defined as program controlled.
02B7	JRNoNewPrivs
	Attempt to change UID/GID privileges was denied because the No_New_Privs attribute is active.
	Action: Ensure that the calling thread's No_New_Privs attribute is properly set. Either JRNoNewPrivs should be turned off or the attempt to change the UID/ GID is invalid.
0302	JRIpcBadID
	The ID is not valid or has been removed from the system.
	Action: A bad IPC member ID specified on the request is not correct. Reissue the command using an existing IPC member ID.
0303	JRIpcDenied
	Access was denied because the caller does not have the correct permission.
	Action: The caller lacked ownership, read or alter permission.
0304	JRIpcExists
	The caller issued CREATE, EXCL and the key was already defined to InterProcess Communications.
	Action: Ensure the key specified on shmget, semget, and msgget has not been assigned an IPC member ID or do not specify IPC_EXCL.
0305	JRIpcMaxIDs
	The number of IDs exceeds the system limit and the create fails.
	Action: Remove unused IDs from the system using the shell command ipcrm or change the system limit. This system limit is set by parameters IPCMSGNIDS, IPCSHMNIDS, and IPCSEMNIDS in a BPXPRMxx parmlib member. You can view these values using the ipcs -x shell command.

Value	Description
0306	JRIpcNoExist
	The caller tried to locate a member for the key specified but it does not exist.
	Action: Specify Ipc_CREAT on the IPC get.
0307	JRIpcRetry
	NOWAIT was specified but the operation could not be performed immediately.
	Action: Reissue the request later.
0308	JRIpcSignaled
	An IPC wait was interrupted by a signal.
	Action: Process the signal.
0309	JRIpcBadFlags
	Extraneous bits were set in the flags word parameter or in the mode flag bit field.
	Action: Correct the syscall invocation.
030A	JRMsqBadType
	Message type must be greater than zero.
	Action: Correct the syscall invocation.
030B	JRMsqBadSize
	The message length exceeds the system limit or is less than zero.
	Action: Correct the syscall invocation.
030C	JRMsqNoMsg
	No message of the type requested was found.
	Action: Invoke the syscall when a message of the type requested is on the message queue, or do not specify IPC_NOWAIT.
030D	JRMsq2Big
	The message to receive was too large for the buffer and MSG_NOERROR was not specified.
	Action: Increase the buffer size, or specify MSG_NOERROR.
030E	JRSema4BadAdj
	The value specified would exceed the system limit for semadj.
	Action: Do not use the UNDO flag in the semaphore operations; use semctl to reset the UNDO values and to look for user errors in the method of use.
030F	JRSema4BadNOps
	Number of semaphore operation exceeds the system limit.
	Action: Either specify a smaller number of semaphore operations or ask your system administrator to change this system limit. This system limit is set by the IPCSEMNOPS parameter in a BPXPRMxx parmlib member. You can view this value using the ipcs -x shell command.

Value	Description
0310	JRSema4BadNSems
	Semaphore ID already exists for the KEY, but the number of semaphores is less than requested.
	Action: Either change the number of semaphores requested, or specify a different ID on the request.
0311	JRTypeNotPID
	A msgrcv or msgsnd did not have its process ID as type.
	Action: Msgget flags require process ID with TYPE operands.
0312	JRSema4BadSemN
	The semaphore number is invalid.
	Action: Choose a semaphore number from 0 to the number of semaphores - 1.
0313	JRSema4BadValue
	The value specified would exceed the system limit.
	Action: Specify a value less than or equal to 32 767.
0314	JRSema4BigNSems
	The number of semaphores exceeds the system maximum.
	Action: Either specify a smaller number of semaphores or ask your system administrator to change this system limit. This system limit is set by the IPCSEMNSEMS parameter in a BPXPRMxx parmlib member. You can view this value using the ipcs -x shell command.
0315	JRSema4ZeroNSems
	The number of semaphores specified was zero and the semaphore does not exist.
	Action: If the number of semaphores is zero, Ipc_CREAT should not be specified.
0316	JRShmBadSize
	The shared memory segment size is incorrect or outside the system defined range of valid segment sizes.
	Action: Specify a segment size less than the system defined maximum. When a shared memory identifier already exists for this key, specify a segment size that is less than the segment size specified on the shmget that created this segment. When a shared memory identifier does not exist for this key, specify a shared memory size greater than zero. You can also have your system administrator change the parmlib values to increase the maximum shared memory segment size. This system limit is set by the IpcShmNSegs parameter in a BPXPRMxx parmlib member. You can view this value using the ipcs -x shell command.
0317	JRShmMaxAttach
	The number of shared memory attaches for the current process exceeds the system defined maximum.
	Action: Detach shared memory segments not being used by the process and retry the operation. If the problem persists, request that your system administrator change this system limit. This system limit is set by the IPCSHMNSEGS parameter in a BPXPRMxx parmlib member. You can view this value using the ipcs -x shell command.

Value	Description
0318	JRIpcRemoved
	During a wait, the IPC member ID was removed from the system.
	Action: Stop using the IPC memory ID, which has been removed.
0319	JRMsqQBytes
	Not permitted to increase message qbytes or attempt by superuser to set message qbytes exceeds system limit.
	Action: If you are not a superuser, do not try to increase the message queue bytes. If you are, do not try to increase message queue bytes past the system limit or to change the system-imposed maximum. This system maximum is set with the IPCMSGQBYTES parameter in a BPXPRMxx parmlib member. You can view this value using the ipcs -x shell command.
031A	JRBadPerfGroup
	The specified priority or nice value represents a performance group that could not be used.
	Action: Contact your system administrator.
031B	JRBadServClass
	The specified priority or nice value represents a service class that could not be used.
	Action: Contact your system administrator.
031C	JRMsqQueueFullMessages
	IPC_NOWAIT was specified but the operation was not done because there was no room in the message queue due to the number of messages in the message queue.
	Action: Increase the system limit for the number of messages per message queue, retry the operation when there is room in the message queue, or do not specify IPC_NOWAIT.
031D	JRMsqQueueFullBytes
	IPC_NOWAIT was specified and the operation was not done because there was no room in the message queue due to the number of bytes in the message queue.
	Action: Increase the system limit for the number of bytes per message queue, retry the operation when there is room in the message queue, or do not specify IPC_NOWAIT.
031E	JRRFileNoRead
	A call tried to read a file opened without read access.
	Action: Reopen the file for read or read/write access.
031F	JRSemStorageLimit
	The semget or semop failed because the semaphore storage limit was reached.
	Action: Too many semaphore sets and/or too many UNDO structures.

Value	Description
0320	JRInheEye
	The inheritance area contains an incorrect eyecatcher value.
	Action: The eyecatcher value must be INHE. Reissue the BPX1SPN callable service with the correct eyecatcher value.
0321	JRInheLength
	The length specified for the inheritance area contains an incorrect value.
	Action: The length value must equal the constant value Inhe#len. Reissue the BPX1SPN callable service with the correct length value.
0322	JRInheVersion
	The inheritance area contains an incorrect version number.
	Action: The version number value must be equal to the constant Inhe#Ver. Reissue the BPX1SPN callable service with the correct version number value.
0323	JRSpawnTooManyFds
	The count of file descriptors specified is greater than the maximum supported by the system.
	Action: The file descriptor count must be less than constant value OPENMAX. Reissue the BPX1SPN callable service with the correct file descriptor count.
0324	JRSmNoStorage
	There is no storage available to allocate.
	Action: See your IBM service representative.
0325	JRSmDspservErr
	The DSPSERV macro failed.
	Action: See your IBM service representative.
0326	JRSmInvalidDsID
	The data space group ID is not valid.
	Action: See your IBM service representative.
0327	JRSmInvalidDsSToken
	The data space SToken is not valid.
	Action: See your IBM service representative.
0329	JRShmMaxSpages
	The operation was not done because the system wide limit for shared memory segment pages was exceeded.
	Action: Try again later. If the problem persists, ask your system administrator to change this system limit. This system limit is set by the IPCSHMSPAGES parameter in a BPXPRMxx parmlib member. You can view this value using the ipcs -x shell command.
032A	JRNoAccess
	Caller does not have access to function.
	Action: This is an internal system call. You are not authorized to access this function.

Value	Description
032B	JRSmInvalidLength
	The length the requested storage exceeds maximum.
	Action: See your IBM service representative.
032C	JRFdListTooBig
	The size of the file descriptor list is larger than can be currently supported.
	Action: The file descriptor list must not exceed the available storage space in the caller's private area. Reissue the callable service with a smaller file descriptor list.
032D	JRBadFdList
	The file descriptor list supplied on the call to BPX1SPN is not accessible by the caller.
	Action: The file descriptor list must be in storage accessible by the caller of BPX1SPN. Check the storage the specified file descriptor list resides in.
032E	JRNotMapped
	One or more specified pages are not mapped.
	Action: An error was detected during the mprotect, msync, or munmap callable service. One or more storage pages in the specified address range are not part of an existing memory mapping. You can only operate on existing mappings.
032F	JRClnyASCREFailed
	The ASCRE macro issued to start a colony address space returned a failing return code.
	Action: Ensure that the Address space name specified on the FILESYSTYPE parmlib statement in the BPXPRMxx member is correct or refer to the documentation of the ASCRE service.
0330	JRClnyStartFailed
	A colony address space failed to initialize.
	Action: Ensure that the ASName operand on the FILESYSTYPE parmlib statement in the BPXPRMxx member specifies a valid procedure name.
0331	JRClnyNotStopped
	The colony address space could not be stopped.
	Action: Ensure that there are no PFSes running in the colony address space and retry the request.
0332	JRClnyNoCommonStorage
	The system was unable to obtain storage in common for a control block to represent a colony address space.
	Action: The system is probably experiencing a common storage shortage and the request cannot be satisfied until the shortage is corrected.
0333	JRPfsNotDubbed
	The PFS task calling an OSI service is not dubbed.
	Action: The PFS address space must be dubbed before an independent task in that address space can make most OSI service requests. To be dubbed, the PFS can invoke getpid or almost any z/OS UNIX service.

Value	Description
0334	JRClnyNotStarted
	An attempt was made to start a PFS within a colony address space. The colony was either not completely initialized or it was being terminated.
	Action: Ensure that the colony is completely initialized and retry the request.
0335	JRPtyChgFromSubsidiary
	An attempt was made to change a termios flag from the subsidiary pty, which is only allowed from the manager.
	Action: To make the change, issue the tcsetattr against the manager pty.
0336	JRClnyPfsNotStarted
	An attempt was made to stop or clean up a colony PFS that was not previously started
	Action: Issue the Stop request for a colony PFS that has previously been started.
0337	JRClnyPfsNotDone
	An attempt was made to clean up a colony PFS that was not completely terminated.
	Action: Ensure that the colony PFS is completely terminated and retry the request.
0338	JRCpbNotFound
	No Cpb was found on the Cpb chain representing this colony PFS.
	Action: See your IBM service representative.
0339	JRDevConfigTypeError
	An attempt was made to configure a device driver that was not defined.
	Action: Ensure that the device type is spelled correctly and retry the request.
033A	JRPtyNeedPKT3270
	An attempt was made to set 3270 Passthru mode without 3270 Packet mode.
	Action: Use 3270 Passthru mode only on pty connections that operate in 3270 Packet mode. 3270 Packet mode can be set only from the manager pty.
033B	JRMmapOverEOF
	The extended file cannot be mapped over its EOF point.
	Action: The memory mapped file was extended and subsequently mapped beyond the original EOF point, while an existing memory map containing the original EOF poin was outstanding. It is recommended that once a file is extended, perhaps via the write callable service, any memory map of the same file should be unmapped and remappe if the memory map contains the original EOF point.
033C	JrRaiseHardLimit
	An attempt was made to raise a hard limit without superuser authority.
	Action: Do not attempt to raise a hard limit without superuser authority.
033D	JrInvalidResource
	The input resource value is not valid.
	Action: Retry the request with a valid resource value.

Value	Description
033E	JrSoftExceedsHard
	An attempt was made to raise a soft limit above its hard limit.
	Action: Do not attempt to raise a soft limit above its hard limit.
033F	JrSoftBelowUsage
	An attempt was made to lower a soft limit below the current usage for the resource.
	Action: Do not attempt to lower a soft limit below the current usage for the resource.
0340	JrInvalidWho
	The input who value is not valid.
	Action: Retry the request with a valid who value.
0341	JrCPUTimeObtainFailed
	Failure obtaining CPU time usage.
	Action: See your IBM service representative.
0342	JrVsmListError
	The VSMLIST macro failed.
	Action: See your IBM service representative.
0343	JRPtyMutuallyExclusive
	An attempt was made to set mutually exclusive bits.
	Action: Select only one of the mutually exclusive bits in the termios.
0344	JRMmapStgExceeded
	The system-wide limit on the amount of memory consumed by memory mapped areas is exceeded.
	Action: Try again later. If the problem persists, either reduce the size of the memory mapping request, or request the system administrator to increase the MAXMMAPAREA parameter of the BPXPRMxx parmlib member.
0345	JRPathconf
	The Vnode operation pathconf is not supported by this file system.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
0346	JRNotPage
	A location specified or generated is not on a page boundary.
	Action: Specify the address and/or length in page multiples.
0347	JRMmapBadType
	The value of the map_type is not valid.
	Action: The map_type specified for mmap is not valid.

Value	Description
0348	JRHardware
	A request was made for a hardware that is not available.
	Action: A function was requested that required hardware that is not available on this processor.
0349	JRAddressNotAvailable
	A request was made for a storage address, but it could not be satisfied.
	Action: Either an address parameter was not valid or an address generated by one or more parameters is not valid.
034A	JRProcMaxMmap
	The process has exceeded the maximum number of mmaps.
	Action: Reduce the number of mmaps used by the process.
034B	JRMmapFileAddress
	File_offset + map_length exceeds file size.
	Action: Use fstat to determine the file size prior to mmap.
034C	JRIarvServ
	An invocation of IARVSERV service failed.
	Action: Retry the operation at a later time.
034D	JRPtyPendingControlInfo
	An attempt was made to write to a managerpty in 3270 packet mode when control information was pending.
	Action: Issue a read to the manager pty to obtain the control information. Then reissue the write.
034E	JRZeroOrNegative
	An input parameter must be greater than zero.
	Action: Correct that parameter.
034F	JRNoUserStorage
	The service could not obtain enough storage in user address space.
	Action: Free storage in user address space and retry the service.
0350	JRAsynchMount
	The request to mount a file system will complete asynchronously. The system rejects all vnode (file) operations against the file system.
	Action: Use w_getmntent to determine when the mount completes.
0351	JRPfsOpNotSupported
	The pfsctl command is not supported by this PFS.
	Action: Verify that the operation was performed on a physical file system that supports the operation.

Value	Description
0352	JRPfsOpNotPermitted
	Not authorized to perform this pfsctl operation.
	Action: The request must be made by an authorized user.
0353	JRPfsArgLenBad
	The argument length is not valid for this pfsctl operation.
	Action: Specify a valid length for this argument.
0354	JRDdBadConfigOpt
	The CONFIGURE operation is not supported by this device driver.
	Action: See your IBM service representative.
0355	JRDdConfigInbuf2Big
	The CONFIGURE input buffer too large.
	Action: See your IBM service representative.
0356	JRDdConfigOutbuf2Big
	The CONFIGURE output buffer too large.
	Action: See your IBM service representative.
0357	JRDdBadDdType
	The device driver TYPE is not known to the system.
	Action: See your IBM service representative.
0358	JRDdNoDdConfigure
	The device driver TYPE does not support a dd_configure routine.
	Action: See your IBM service representative.
0359	JRDdwtTaskTerm
	The operation could not be completed because the device driver work thread terminated.
	Action: See your IBM service representative.
035A	JRDdConfigAbend
	An abend occurred during dd_config processing.
	Action: See your IBM service representative.
035B	JRCaptureFailure
	A memory capture (IARVSERV) failed.
	Action: A CTrace record was written with the return codes.
035C	JRHotCCreateFailure
	An attempt to create a Hot C environment for a physical file system failed.
	Action: See your IBM service representative.

Value	Description
035D	JRVdacError
	The Vdac macro failed.
	Action: See your IBM service representative.
035E	JRBadSiginfoAddr
	An incorrect siginfo_t address was passed to the wait-extension service.
	Action: Reissue the call to the wait-extension service (BPX1WTE) with a siginfo_t return area address that is accessible to the caller.
035F	JRBadRUsageAddr
	An incorrect rusage address was passed to the wait-extension service.
	Action: Reissue the call to the wait-extension service (BPX1WTE) with an rusage return area address that is accessible to the caller.
0360	JRPtyNoTRTStorage
	Storage is not available for pseudo-TTY scan tables.
	Action: Retry the request. If this condition persists, contact the system programme
0361	JRBadStDev
	The device number specified to osi_mountstatus does not refer to a mounted file system.
	Action: Use w_getmntent to determine the correct device number (MNTENTFSDEV)
0362	JRDdNoDdwt
	The device driver task is not active.
	Action: See your IBM service representative.
0363	JRBadInputBufAddr
	Bad input buffer address.
	Action: See your IBM service representative.
0364	JrOpenFileLimitMax
	The Open file limit cannot exceed 524287.
	Action: Select a hard limit that is smaller than the physical system maximum.
0365	JrFdOpenAboveLimit
	A file descriptor is open above requested limit.
	Action: Select a limit which is greater than the highest open file descriptor.
0366	JrWriteBeyondLimit
	Cannot write beyond the file size limit.
	Action: Increase the file size limit for the process, or write less data to the file.

Value	Description
0367	JrSyscallFailAll
	An attempt to process a syscall for a socket failed on all of the transport providers supporting the socket.
	Action: Close the socket. See the return code for more information about the failure.
0368	JrSyscallFailOne
	An attempt to process a syscall for a socket failed on one of the transport providers supporting the socket.
	Action: Close the socket. See the return code for more information about the failure.
0369	JrSyscallFailSome
	An attempt to process a syscall for a socket failed on some of the transport providers supporting the socket.
	Action: Close the socket. See the return code for more information about the failure.
036A	JrSetSockOptFailAll
	An attempt to set socket options failed on all of the transport providers supporting the socket.
	Action: If the socket option is not supported, reissue the syscall with the correct option. See the return code for more information about the failure.
036B	JrSetSockOptFailOne
	An attempt to set socket options failed on one of the transport providers supporting the socket.
	Action: Different socket options are now in effect for each of the transport providers. If a specific option is required, you have to bind to a specific IP address that supports the specified option. To synchronize all the transport providers with the same socket options, close the socket, then reopen it with the socket syscall. See the return code for more information about the failure.
036C	JrSetSockOptFailSome
	An attempt to set socket options failed on some of the transport providers supporting the socket.
	Action: Different socket options are now in effect for each of the transport providers. If a specific option is required, you have to bind to a specific IP address that supports the specified option. To synchronize all the transport providers with the same socket options, close the socket, then reopen it with the socket syscall. See the return code for more information about the failure.
036D	JrRlimitCantCreate
	You cannot create files when RLIMIT_FSIZE is 0.
	Action: Increase the process file size limit and issue the create again.
036E	JRBadOutputBufAddr
	Bad output buffer address.
	Action: See your IBM service representative.

Value	Description
036F	JRNotStdFile
	Only standard files can be mmap.
	Action: Use the file descriptor of a standard file.
0370	JRBadIDType
	An invalid ID type was passed.
	Action: Reissue the call with a valid ID type.
0371	JRBadOptions
	Incorrect options were passed on the options parameter.
	Action: Reissue the call with valid options.
0372	JRCdstAlreadyAdded
	Character special service routine detected an ADD request for a previously completed CDST entry.
	Action: See your IBM service representative.
0373	JrDdConfigNoResource
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
0374	JrDdNotConfigured
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
0375	JrDdConfigBadOpt
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
0376	JrTbmStorageFailure
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
0377	JrTbmAttachFailure
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
0378	JrTbmLatchSetFailure
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
0379	JrOcsNotConfigured
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.

Value	Description
037A	JrOcsDevNotConfigured
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
037B	JrDevUnfigPnd
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
037C	JrRtyDevConfigChange
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
037D	JRPtyNotCntlTerm
	The device is not associated with a controlling terminal.
	Action: The device specified is not associated with a controlling terminal. Correct the program or rerun it in an environment where the device is a controlling terminal.
037E	JrOcsAdminBufferExceeded
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
037F	JrRtyBadMultiByteCodePageName
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
0380	JrOcsRtyOutBufferExceeded
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
0381	JRPrevSockError
	A previous error caused this socket to become unusable.
	Action: Close the socket.
0382	JrOcsNotConnected
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
0383	JrRtyDifferentFIle
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
0384	JRBadOsi
	The Osi structure passed is not valid.
	Action: Ensure that the Osi structure passed to the OSI routine is the Osi structure received from the LFS on this operation.

Value	Description
0385	JRBadPfsId
	The value of the OsiPfsId field is not valid.
	Action: Ensure that the Osi structure passed to the OSI routine is the Osi structure received from the LFS on this operation.
0386	JRFRRActive
	An FRR is established.
	Action: Do not establish a functional recovery routine (FRR) before calling a service that may be interrupted by a signal.
0387	JRPtyQueueChange
	A termios option change requires all output be read or flushed before further writes.
	Action: Retry the subsidiary pty write after all output has been read from the manager pty pty.
0388	JRIntervalTypeInvalid
	The IntervalType is not valid.
	Action: See the ITIMER constants in BPXYITIM or see <u>z/OS UNIX System Services</u> <u>Programming: Assembler Callable Services Reference</u> for details.
0389	JrRtyNoResource
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
038A	JrRtyTermSyscall
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
038B	JrRtyNoReply
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
038C	JrOcsErrno
	OBSOLETE - DO NOT USE.
	Action: See your IBM service representative.
038D	JRPtyOrphaned
	The syscall is processing in an orphaned process group.
	Action: This condition most likely occurs when a process that is forked from the session leader (generally the shell) issues a syscall to the pseudo-TTY device after the session leader process has ended. The process cannot access the terminal once the session leader process ends. This pseudo-TTY session is no longer usable. Restart the application from another session.
038E	JRTransportDriverNotAccessible
	The transport driver specified is not being used by the socket specified.
	Action: Verify the address specified is proper for this socket.

Value	Description
038F	JRInvSignalForProcess
	The specified signal number is incorrect.
	Action: The specified signal number is thread-scoped and is only supported under pthread_kill. It cannot be used in a process-scoped command like raise, kill, killpg, or sigqueue. Reissue the request with a correct signal number, or reissue the signal using pthread_kill.
0390	JRUserNameBad
	The user name is not a valid MVS user name.
	Action: Ensure that the user name contains all legal characters for a MVS user name.
039E	JRTooManyFds
	Too many Fds were specified.
	Action: Reduce the number of Fds that were specified to a number that is supported by the syscall.
039F	JRMicroSecondsTooBig
	The value specified for microseconds is outside the allowable range.
	Action: Change the value specified for microseconds to be less than 1 000 000 (1 million).
03A0	JrSockPrerouterErr
	The Common Inet Sockets Prerouter returned an error.
	Action: See your IBM service representative.
03A1	JROsiAbend
	An abend occurred in an Operating System Interface routine.
	Action: See your IBM service representative.
03A2	JRSTIMERMMax
	A 32E system abend has been intercepted by the syscall. See the appropriate MVS System Codes manual.
	Action: Reduce the number of STIMERMs that are active.
03A3	JRNoClnyThreadSppt
	Colony thread support has not been built.
	Action: Ensure that colony thread support was requested by the PFS at initialization time.
03A4	JRSHSPMASK
	The shared subpool mask is not valid for the current environment.
	Action: The shared subpool mask specified on the BPX1PTC invocation does not match the mask specified on the initial call to BPX1PTC within the current process image. Only one shared subpool mask is supported for a given process image. Reissue the BPX1PTC callable service with the shared subpool mask that was specified on the first BPX1PTC call.

Value	Description
03A5	JrOWaitSetupErr
	An error occurred attempting OsiWait setup.
	Action: See your IBM service representative.
03A6	JrBadOptnFlags
	Extraneous bits were set in the option flags parameter.
	Action: Correct the input parameter.
03A7	JrNegFileSizeLimit
	One of the file size limits specified is negative.
	Action: Specify a file size limit that is greater than or equal to zero.
03A8	JrNoSAFsupport
	The installed Security product does not support this function.
	Action: Install a security product that does support this function.
03A9	JRPtNoStorage
	Not enough storage is available for ptrace.
	Action: A Pt_Capture request is unable to obtain enough buffer storage.
03AA	JRPtBufNotFound
	A Pt_Uncapture ptrace request was issued for a specific buffer but the buffer was not previously captured with a Pt_Capture request.
	Action: Use the Pt_Capture request before using Pt_Uncapture for a specific buffer.
03AB	JRPtTso
	The specified ptrace function is not supported in a TSO address space.
	Action: Do not try to use the ptrace request in question on a program in a TSO address space.
03AC	JRAuthCaller
	The caller of this service is authorized. Authorized callers are not permitted to load or call unauthorized programs or programs residing in a file system mounted with the NOSETUID parameter.
	Action: System key, supervisor state, or APF authorized callers cannot load or call unauthorized programs. A program with the APF attribute is considered unauthorized if it resides in a file system mounted with the NOSETUID parameter.
03AD	JrSingleTDReqd
	The Common Inet Sockets ioctl command requires that a single transport driver be connected to the socket.
	Action: Use the ioctl IocC#TcCN command or the bind service, to connect with a single transport driver before issuing the failing ioctl command.

Value	Description
03AE	JRBatSel
	The batch-select VFS operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
03AF	JRRealPageNotSupported
	A Fuio area containing a real page address was passed.
	Action: Ensure that the Fuio provided contains only virtual page addresses and that the FuioRealPage flag indicator is off.
03B0	JRBadMVSPgmName
	A call to the exec or loadHFS service specified a file that resolves to an MVS program name that is not valid.
	Action: Ensure that the external link for the specified file is a valid MVS program name.
03B1	JRMVSLoadFailure
	A call to the loadHFS service resulted in a failure in the MVS Load service.
	Action: Ensure that the specified file points to a MVS program that is loadable by the caller.
03B2	JRMVSPgmNotFound
	A call to the exec or loadHFS service specified a file that resolves to an MVS program that cannot be found.
	Action: Ensure that the specified file points to a MVS program that exists in the caller's MVS program search order.
03B3	JRNoConsoleBuffers
	The write to /dev/console cannot complete.
	Action: Attempt the request at another time.
03B4	JRPtMaxCapture
	The ptrace capture request would exceed maximum allowed.
	Action: A Pt_Capture request would exceed the maximum amount of captured storage allowed.
03B5	JRCPCNnotEnabled
	Code Page Change Notification is not enabled.
	Action: A tosetop or tosettables must be done to enable the CPCN (Code Page Change Notification) function.
03B6	JRExitAbend
	An abend occurred in a File Exporter Exit.
	Action: See your IBM service representative.

Value	Description
03B7	JRShrStgShortage
	Request for shared storage exceeds amount available.
	Action: A mmap or shmget call resulted in a request for shared system storage that exceeds the amount available as specified by the MAXSHAREPAGES statement in the BPXPRMxx parmlib member.
03B8	JRPtyNeedPKTXTND
	An attempt was made to set 3270 Passthru mode without 3270 Packet mode.
	Action: Use 3270 Packet mode only on pty connections which operate in Extended Packet mode. Extended Packet mode can be set only from the manager pty.
03B9	JRWaitForever
	The timeout value specified wait forever, but there were no events to wait for.
	Action: Reissue the request specifying at least one event in the pollfd structures, or change the timeout value to something other than -1.
03BA	JRInvalidNfds
	The NFDS parameter is larger than the OPEN_MAX (MAXFILEPROC) value.
	Action: Reissue the request specifying a value for the NFDS parameter that is less than OPEN_MAX or ask the system programmer or system administrator to increase the MAXFILEPROC value in the BPXPRMxx parmlib member.
03BB	JRClnyPfsNotAllowed
	The requested operation is not allowed for a PFS that is running in a colony address space.
	Action: See your IBM service representative.
03BC	JRPtyNotManager
	Unsupported function against TTY.
	Action: The requested function is not allowed against a pseudo-TTY. Correct the program and rerun.
03BD	JRFsUnAuthClnt
	An unauthenticated client is denied access.
	Action: A server working on behalf of an unauthenticated client is not allowed to access files on a remote system. Log on to the server with a password to become authenticated and try again.
03BE	JRBadBufLen
	The length of the buffer is not valid.
	Action: The total buffer length specified for this request must be less than or equal to 62 464. Retry the request specifying a valid buffer length parameter.
03BF	JRBadStgKey
	The message data could not be fetched using the specified storage key.
	Action: The buffer was allocated in a storage key that did not match the specified ke for the MSGSTGKEY parameter. Retry the request specifying a valid storage key.

Value	Description
03C0	JRIxcMsgo
	An unexpected error occurred in the IXCMSGO macro.
	Action: See your IBM service representative.
03C1	JrNoFdsTooManyQIds
	The number of Fds specified is negative or too many Msg Q Ids specified on select or poll service.
	Action: Specify a non-negative number of Fds or reduce the number of Msg Q Ids to be processed for select or poll below the maximum number of Msg Queues supported by the system.
03C2	JRInvHdr
	Invalid parameter list header.
	Action: The structure containing the service parameters contained an incorrect eye-catcher or length. Correct the program and rerun.
03C3	JRIxcMsgi
	An unexpected error occurred in the IXCMSGI macro.
	Action: See your IBM service representative.
03C4	JRIXCXCDSIfail
	An unexpected error occurred in the IXCXCDSI macro.
	Action: See your IBM service representative.
03C5	JRIXCXCDSIenv
	An environmental error occurred in the IXCXCDSI macro.
	Action: See your IBM service representative.
03C6	JRIXCXCDSInoCDS
	An environmental error occurred in the IXCXCDSI macro, OMVS CDS not available.
	Action: See your IBM service representative.
03C7	JRIXCXCDSIinvparm
	An invparm error occurred in the IXCXCDSI macro.
	Action: See your IBM service representative.
03C8	JRIXCXCDSIaccess
	An invparm error occurred in the IXCXCDSI macro, not able to access dataarea or token.
	Action: See your IBM service representative.
03C9	JRIXCXCDSIvalidate
	An invparm error occurred in the IXCXCDSI macro, validate failed for dataarea or token.
	Action: See your IBM service representative.

Value	Description
03CA	JROutOfMountEntries
	The system is unable to obtain an entry in the file system mount table in the OMVS couple data set.
	Action: Either free an entry by unmounting a file system, or request your system programmer to create a new OMVS couple data set which supports a larger number of mounts. The system programmer will need to run the XCF couple data set format utility for TYPE(BPXMCDS) to increase the number of MOUNTS supported then issue the SETXCF COUPLE operator command to add the new OMVS couple data set as the alternate and then PSWITCH to make the alternate couple data set the primary couple data set for OMVS.
03CB	JRPtyUnsupportedAttr
	Attempt to change attribute to unsupported value.
	Action: An attempt was made to change one or more attributes in the termios to unsupported values, and no supported attributes were changed.
03CC	JRTgtMemberInactive
	The XCF member represented by the input member token is not active. For a Shared File System configuration, this can occur when a system is attempting to send a message to another system and that target system is no longer active in the configuration.
	Action: Ensure that the correct target member token was specified. If the target member is not active, any action taken depends on your application. For a Shared File system configuration, retry the operation as it is usually a recoverable error.
03CD	JRnoSavedToken
	The saved IXCXCDSI token is zero for a request that expects a valid token.
	Action: See your IBM service representative.
03CE	JRStaleVfs
	The Vfs passed to complete asynchronous mount does not represent an outstanding asynchronous mount.
	Action: Ensure that the correct Vfs is supplied.
03CF	JRNoArea
	The State Area has not been established.
	Action: A Write must be the first operation.
03D0	JRBadSubField
	A subfield of the Argument is not valid.
	Action: Examine each arg subfield for correctness.
03D1	JRNoChangeIdentity
	The invoker is not authorized to change MVS userids.
	Action: Daemon authorization is required for this function.

Value	Description
03D2	JRBadId
	An incorrect ID value was passed to the BPX1WTE service.
	Action: Respecify a valid ID value on the BPX1WTE service call.
03D3	JRNoWorkUnit
	Attempt to transfer work via BPX1SPW call failed.
	Action: A get work call via BPX1SPW must be made to obtain a work unit before a transfer can be done.
03D4	JrNoWLMConn
	Attempt to refresh work via BPX1SPW call failed.
	Action: A successful call to BPX1SIN must be made to connect to WLM before a refresh can be done.
03D5	JRMgcreErr
	MGCRE macro invocation failed on BPX1SPW call.
	Action: See your IBM service representative.
03D6	JrNoMulti
	Attempt to issue multiple BPX1CCS calls.
	Action: There can only be one Console Modify listening thread actively engaged at one time per address space.
03D7	JrMsgLengthErr
	Message length to the console was exceeded.
	Action: Check syscall documentation for maximum length.
03D8	JRInvalidClassify
	The classification area is not accessible to the current caller.
	Action: The address or length of the classification data passed was not valid. Retry the request with a valid address and length for the classification data area.
03D9	JrNoEnclave
	No enclave is associated with the calling thread or process.
	Action: A get work call to BPX1SPW must be done to obtain a work unit prior to performing a transfer work unit.
03DA	JrSubSysNotFnd
	No process was found with the associated subsystem type and subsystem name.
	Action: A work manager must be established with BPX1SIN prior to transferring work.
03DB	JRApplDataLenErr
	The application data area is too large to be processed.
	Action: Reduce the amount of application data being passed via BPX1SPW.

Value	Description
03DC	JrBadOptCode
	Bad entry code to process work unit.
	Action: See your IBM service representative.
03DD	JRInvalidApplData
	The application data area passed was not accessible.
	Action: The address or length of the application data passed to BPX1SPW was not valid. Retry the request with a valid address and length for the application data area.
03DE	JRInvalidApplData2
	The application data area is not accessible to the current caller.
	Action: The caller's key is different than the area previously obtained for the application data. Retry the BPX1SPW request with the same key as previously used.
03DF	JRInvalidSFDL
	The file descriptor list passed was not accessible.
	Action: The address of the file descriptor list or the count field within the list was not valid. The area may be in an incorrect storage key. Retry the BPX1SPW request with a valid address and count.
03E0	JRNewLocationErr
	The new tag data area passed was not accessible.
	Action: The address or length of the new tag data passed was not valid. Retry the request with a valid address and length.
03E1	JROldLocationErr
	The old tag data area passed was not accessible.
	Action: The address or length of the old tag data area was not valid. Retry the request with a valid address that points to a 66 byte area.
03E2	JRNewLenBad
	The new tag data length was not valid.
	Action: The length of the new tag data area is outside of the allowable range. Retry the request with a valid new tag data length.
03E3	JrMsgAttrErr
	Message attribute error detected.
	Action: The length passed must be equal to the current version, and the CCAID and CCAVERSION must be initialized to the constants defined in BPXYCCA.
03E4	JRNoAck
	No acknowledgement signal from remote system.
	Action: The transmitted data may be lost. User should transmit the data again.
03E5	JRIPAddrNotAllowed
	The input IP address is not valid.
	Action: See your IBM service representative.

Value	Description
03E6	JRPrevBound
	The requested port number is in use.
	Action: See your IBM service representative.
03E7	JRInaccessible
	The user storage is inaccessible.
	Action: Make sure user storage is accessible and key 8.
03E8	JRIefddsrvFailed
	The macro IEFDDSRV failed.
	Action: Make sure the specified gateway address or IP address is correct.
03E9	JRSvc99Failed
	SVC 99 (Allocate) failed.
	Action: The specified device cannot be allocated. It may have already been allocated. Make sure that the gateway address is specified correctly.
03EA	JRDevNotOnline
	Specified device is not online.
	Action: The specified device is not online. Verify that the gateway address is specified correctly. If correct, then verify that it is online.
03EB	JRDevNotFound
	Specified device is not found.
	Action: The specified device cannot be found. Make sure that the gateway address is specified correctly.
03EC	JRAlreadyInProgress
	Another config request is in progress.
	Action: Wait until the other config completes.
03ED	JRInvalidVersion
	Config request has invalid version number.
	Action: Use correct version number.
03EE	JRNotAuthWLM
	Server_init service call failed permission check for BPX.WLMSERVER facility class profile.
	Action: Caller must be given read permission to BPX.WLMSERVER facility class profile in order to use the server_init service successfully.
03EF	JRTargetIPNotFound
	Target IP address cannot be found.
	Action: Caller must define target ip address using config.

Value	Description
03F0	JRESCONNotConfigured
	The ESCON connection is not configured.
	Action: Use the configstk command to configure the desired ESCON connection and then retry this operation.
03F1	JJRPtySubsidiaryLocked
	A grantpt() was issued against the manager pty but an unlockpt() has not been issued yet.
	Action: Either issue an unlockpt() or do not use grantpt(). Without grantpt(), subsidiary pty permissions are set at the first subsidiary open.
03F2	JRPtySubsidiaryNotLocked
	The subsidiary PTY is not locked either because grantpt was not done or because grantpt has already been issued.
	Action: Either issue a grantpt() before the unlockpt() or do not use unlockpt(). Without grantpt/unlockpt, permissions are set at the first subsidiary open.
03F3	JRPtyGrantptDone
	grantpt() has already been issued. This grantpt is redundant.
	Action: Remove one of the grantpt() calls.
03F4	JRSRBSNotAllowed
	Issuing syscalls from an SRB is not allowed.
	Action: The calling process is either in termination or has reached its limit on concurrent SRBs issuing z/OS UNIX callable services. If the process is not in termination, reissue the callable service. When returned with ENOSYS this means the program on an SRB has made a call for a Physical File System that does not support SRB mode callers.
03F5	JRNotSRBSyscall
	The syscall requested is not supported in SRB mode.
	Action: Either issue the callable service from task mode or use another callable service to perform the function required.
03F6	JRRTSSConnErr
	Fork child processing failed due to a RTSS connection error.
	Action: Contact the system programmer to determine if the RTSS subsystem is up and operational.
03F7	JRRTSSEnvErr
	Fork parent processing failed due to a RTSS environment error.
	Action: Contact the system programmer to determine if the RTSS subsystem is up and operational.
03F8	JRAsyncAuthErr
	User is not authorized for asynchronous i/o.
	Action: Issue the requested function synchronously.

JRAsyncRWLenZero
SINASYIICINVLETIZETO
Zero length asynchronous read or write not permitted.
Action: Issue the requested function synchronously.
JRAsyncBadMsgHdrLen
AioBuffSize is not set to correct message header length.
Action: Set AioBuffSize to the correct value and reissue the request.
JRAsyncBadCmd
AioCmd is not set to a supported value.
Action: Set AioCmd to a supported value and reissue the request.
JRAsyncBadNotifyType
AioNotifyType is not set to a supported value.
Action: Set AioNotifyType to a supported value and reissue the request.
JRAsyncBadOffset
AioOffset is a negative value.
Action: Set AioOffset to a non-negative value and reissue the request.
JRAsyncBadAiocbLen
The input length for the AioCb is not a supported length.
Action: Set the length parameter to the supported length for an AioCb.
JRAsyncBadSockAddr
The AioSockAddrPtr, AioSockAddrLen, AioLocSockAddrPtr or AioLocSockAddrLen contains a bad value.
Action: Set AioSockAddrLen (or AioLocSockAddrLen) to a zero value or set AioSockAddrPtr (or AioLocSockAddrPtr) to the address of an area to receive a sockaddr structure and set AioSockAddrLen (or AioLocSockAddrLen) to the length of that area.
JRSchedSrbErr
The Srb was not scheduled.
Action: See your IBM service representative.
JRBadArq
An invalid Arq was encountered.
Action: See your IBM service representative.
JRCancel
Vnode operation CANCEL is not supported by this file system.
Action: Verify that the operation was performed on a physical file system that supports the operation.

Value	Description
0403	JRDuplicateCancel
	A cancel operation is already in progress for the target asyncio request.
	Action: Wait for the previous cancel request to complete.
0404	JRAsyncNotSingleTd
	The AsyncIO operation can not be performed because this socket does not have a chosen transport stack.
	Action: Issue pfsctl(BPX1PCT) with the SetAsyncIO or SetIbmOpt option to choose an asynchronous I/O capable transport.
0405	JRSMFNotAuthorized
	Thesmf_record function can not be performed because the caller is not permitted to the BPX.SMF facility class and is not APF authorized. The caller must either be permitted to the facility class or APF authorized.
	Action: If the user is to be permitted to use thesmf_record function, the user must be permitted to the BPX.SMF facility class or be APF authorized.
0406	JRSMFNotAccepting
	SMF is not recording SMF records of the type and subtype requested.
	Action: Do not build SMF records for this type and subtype, they are not being recorded.
0407	JRSMFNotActive
	SMF is not active.
	Action: Do not build SMF records for this type and subtype, they are not being recorded.
0408	JRSMFError
	An error occurred in the SMFEWTM SMF macro.
	Action: See your IBM service representative.
0409	JRSMFBadRecordLength
	The length of the SMF record passed tosmf_record is either too large or too small.
	Action: Correct the SMF record size passed to thesmf_record function.
040A	JREnclavesExist
	The calling work manager has enclaves that it created that have yet to be serviced.
	Action: Reissue the SRV_DISCONNECT_COND function on server_pwu later to allow all created enclaves to be serviced.
040B	JRBindNotDone
	Bind() must be issued before issuing read/write.
	Action: Issue Bind() and try request again
040C	JRQhitRecovery
	BPXXQHIT macro reportedly entered recovery.
	Action: See your IBM service representative.

Value	Description
040D	JRPingSelf
	Ping to self is not supported.
	Action: Do not ping to self
040E	JRDuplicateReq
	Requested connection already exists.
	Action: The oeifconfig request to add a connection failed because the connection already exists. You must issue the oeifconfig command to delete the existing connection before you can add it again.
040F	JRTrleNotFound
	Target TRLE name cannot be found.
	Action: Requested TRLE name cannot be found. Caller must define target MPC TRLE resource before using oeifconfig to retrieve it.
0410	JRBpxxuiwrErr
	The BPXXUIWR macro failed.
	Action: See your IBM service representative.
0411	JRFastPathRange
	A new socket descriptor is too large for Fastpath.
	Action: The call to setrlimit() for RLIMIT_NOFILE must be moved to before the first call to socket() when a program is using the _BPXK_INET_FASTPATH environment variable.
0412	JrRosAlreadyReg
	An error occurred during process signal initialization.
	Action: Kernel handling of async I/O can not be done if another Signal Interrupt Routine has already been registered.
0413	JRAsyncSigKey0Err
	A caller in key 0 cannot request signals for async i/o.
	Action: Request another method of notification for async i/o completion.
0414	JRAsyncExitModeTcb
	A request for ExitMode of TCB was requested for a user who is either not running on a TCB or running in key 0.
	Action: Request ExitMode of SRB or change the user key.
0415	JRAsyncOpNotSupp
	The AsyncIO operation can not be performed because the socket transport does not support asynchronous I/O or asynchronous select included a physical file system that could not support this operation.
	Action: Issue pfsctl(BPX1PCT) with the SetAsyncIO or SetIbmOpt option to choose an asynchronous I/O capable transport. In the case of asynchronous select, part of the operation runs on a system SRB so descriptors for PFSes that don't support SRB mode callers can not be included.

Value	Description
0416	JRAsyncBadSigNo
	The AsyncIO operation specified a signal number that does not fall within the valid range of values.
	Action: Specify a signal number which falls within the valid range of values.
0417	JRPriviligedFile
	The operation is not allowed on a privileged file.
	Action: Reset privileged attributes on file and retry the operation.
0418	JRRouteExists
	The oeifconfig contained a duplicate destination IP address.
	Action: Verify the address being added. Delete and re-add.
0419	JRHomeExists
	The oeifconfig contained a duplicate home IP address.
	Action: Verify the address being added. Delete and re-add.
041A	JRAPFNotAuthorized
	The chattr function can not be performed to change the APF attribute because the caller is not permitted to the BPX.FILEATTR.APF facility class.
	Action: If the user is allowed to use chattr to change the APF attribute, the user must be permitted to the BPX.FILEATTR.APF facility class.
041B	JRPGMNotAuthorized
	The chattr function can not be performed to change the program control attribute because the caller is not permitted to the BPX.FILEATTR.PROGCTL facility class.
	Action: If the user is allowed to use chattr to change the program control attribute, the user must be permitted to the BPX.FILEATTR.PROGCTL facility class.
041C	JRProgCntl
	A request to load an executable that is not program-controlled was made into an environment that must be kept clean.
	Action: If the program is to be loaded into this environment, it must have the program controlled attribute.
041D	JRFileSzExcdLimit
	A request to load a file into the LFS Cache was made for a file that exceeds the size limit of the cache.
	Action: If a file is to be loaded into the LFS Cache, it must obey file size limitations.
041E	JRFileIsEmpty
	A request to load a file into the LFS Cache was made for a file that is empty.
	Action: If a file is to be loaded into the LFS Cache, it must have contents.
041F	JRCacheNotRegFile
	Requests to load a file into the LFS Cache are valid for only regular files.
	Action: If a file is to be loaded into the LFS Cache, it must be a regular file.

Value	Description
0420	JRNotMVSLocalFile
	Requests to load a file into the LFS Cache are valid for only local files.
	Action: If a file is to be loaded into the LFS Cache, it must be a local file.
0421	JRFileInUse
	The file cannot be loaded into the LFS Cache because the file is currently in use or the cleanup daemon has not completed.
	Action: After the file is no longer in use, wait 10 minutes and then reissue the command.
0422	JRNoFreeEntry
	No free entries in the interface control array.
	Action: All entries in the interface control array are currently in use. The oeifconfig request cannot be processed. Please try again later.
0423	JRInheUserId
	User Id specified in Inheritance structure is not valid.
	Action: Re-issue Spawn with a valid User Id in the Inheritance Structure.
0424	JRInheRegion
	Region size specified in Inheritance structure is not valid.
	Action: Re-issue Spawn with a valid Region Size in the Inheritance Structure.
0425	JRInheCPUTime
	CPU Time specified in Inheritance structure is not valid.
	Action: Re-issue Spawn with a valid CPU Time in the Inheritance Structure.
0426	JRInheAcctDataPtr
	The account data pointer in the Inheritance structure points to a location not addressable by the caller.
	Action: Re-issue Spawn with InheAcctDataPtr containing the address of a location the caller has access to.
0427	JRInheCWD
	CWD specified in Inheritance structure is not valid.
	Action: Re-issue Spawn with a valid CWD in the Inheritance Structure.
0428	JRTooManyIntf
	Too many configured interfaces already exist.
	Action: The maximum number of interfaces (VTAM resources) have been configured. New interfaces cannot be configured unless some existing interfaces are unconfigured (detached). Retry the oeifconfig after removing some unneeded interfaces.

Value	Description
0429	JRBadIpAddr
	An IP address in the configured interface is incorrect.
	Action: An error was detected during the VTAM channel initialization process. One of the following occur:
	<ul> <li>The partner IP address in the input USERDATA area does not match our local IP address.</li> </ul>
	<ul> <li>The Local IP address in the input USERDATA area does not match our remote partner IP address.</li> </ul>
	Ensure that the IP address specified in the oeifconfig command is correct for the intended remote partner. Retry the oeifconfig command after correcting the error.
042A	JRDataNotAvail
	No data exists to return to the caller.
	Action: Try again later.
042B	JRReqDenied
	The oeifconfig request is not accepted.
	Action: The loop back interface (interface name of LOO) cannot be detached. It can only be deactivated.
042C	JRBadMtuSize
	The specified MTU size for the interface is incorrect.
	Action: An error was detected during the VTAM channel initialization process. One of the following errors occur:
	<ul> <li>The communications partner specified a non-zero MTU size that does not match MVS' local MTU size. By default, MVS uses an MTU size of 32 768.</li> </ul>
	<ul> <li>The partner specified a nonzero MTU size that is greater than the "maximum send size" or the "maximum receive size".</li> </ul>
	No MTU error checking is done if the specified MTU value is zero. Issue the <b>oenetstat</b> -i command on MVS and its equivalent command on the remote partner to display the MTU size being used. Retry the <b>oeifconfig</b> command after correcting the error.
042D	JRNotOsa
	Current® interface is not an OSA adapter.
	Action: An error was detected during the VTAM channel initialization process. the <b>oeifconfig</b> command specified the (remote partner) interface as an OSA adapter. However, the user data from the remote partner says otherwise. Correct the error and reissue the <b>oeifconfig</b> command.
042E	JRBadOsaPort
	Incorrect OSA port number specified.
	Action: The <b>oeifconfig</b> command specified an invalid OSA port number. Only port number 0 is currently supported. Correct the error and reissue the <b>oeifconfig</b> command.

Value	Description
042F	JRJsrCIErr
	A request to convert JCL to SWA control blocks failed.
	Action: See your IBM service representative.
0430	JRJsrRsErr
	A request to create a JSAB for a Forked space failed.
	Action: See your IBM service representative.
0431	JRJsrRacXtr
	A call to RACROUTE failed.
	Action: See your IBM service representative.
0432	JRJsrUavXit
	The IEFUAV exit rejected account data.
	Action: See your IBM service representative.
0433	JRJsrItjt
	The IEFITJT routine had an internal error.
	Action: See your IBM service representative.
0434	JRJsrInt
	Internal error from BPXPRJSR.
	Action: See your IBM service representative.
0435	JRJsrSetUp
	Error setting up running environment.
	Action: See your IBM service representative.
0436	JRWlmWonErr
	An IWMUWON request to create a child address space failed.
	Action: See your IBM service representative.
0437	JRForkExitRcOverlayPgmNotValid
	Contents Supervisor Fork Exit cannot fork overlay programs.
	Action: The contents supervision fork exit detected that a overlay program is present in the caller's environment. Overlay programs cannot be propagated on fork. Either use an alternative to fork, such as spawn, or eliminate the usage of overlay programs when using the fork function.
0438	JrMsgMaxLines
	Maximum number of lines was exceeded.
	Action: Check syscall documentation for maximum number of lines that can be written to console at one time.

Value	Description
0439	JRRddPlusNoCursorSupp
	FuioRddPlus is only supported with the index protocol, not the cursor protocol.
	Action: Specify FuioRdIndex to be greater than 0.
043A	JRBadMaxSendRcvSize
	Incorrect Maximum send/receive size value specified.
	Action: An error was detected during the VTAM channel initialization process. One of the following errors occur:
	<ul> <li>The maximum send size parameter value is less than 32768. The maximum send size parameter value must be at least 32K (32768). The maximum send size may be specified under the MAXBFRU keyword of the Transport Resource List Element (TRLE). That value should be set to at least 9 (size in number of 4K pages).</li> </ul>
	<ul> <li>The partner specified a non-zero MTU size that is greater than its "maximum receive size".</li> </ul>
	Retry the <b>oeifconfig</b> command after correcting the error.
043B	JRPtLDTooManyExtents
	The ptrace loader information request failed because a load module had more than 16 extents.
	Action: A debugger program tried to read loader information for a load module with more than 16 extents.
043C	JRBadHandle
	The lock handle on the lock parameter is not 0.
	Action: Set the lock handle to 0 and reissue the lock request.
043D	JRNoDefault
	Common Inet is running, but there are no transport providers active to run as a Default.
	Action: Local Inet cannot run as part of Common Inet without at least one other AF_INET provider also active. Initialize the provider already defined in the BPXPRMxx parmlib member.
043E	JRBlocksInFlux
	Unable to access internal blocks without lock.
	Action: Determine the status of the process in question and retry thegetthent request for this process or request a different process.
043F	JRLinetFail
	Local inet not correctly set up.
	Action: Either the local INET was started without bringing up the Converged Sockets file system, or the Converged Sockets file system was started with only local INET. Converged Sockets must be brought up with at least one other file system in order for local INET to be started.

Value	Description
0440	JRNoEphemeralPorts
	The supply of ephemeral port numbers is exhausted.
	Action: Verify that socket applications using this stack really need the port numbers. The ephemeral port range can only be increased by reducing the CINET INADDR_ANY range.
0441	JRSocketSynReceived
	A SYN was received on the socket connection.
	Action: The socket connection was dropped. Re-establish the socket connection.
0442	JRSocketRstReceived
	A RST was received on the socket connection.
	Action: The socket connection was dropped. Verify the status of the remote partner. Then re-attempt the socket connection.
0443	JRSelfConnect
	Connect to self is not allowed.
	Action: Use a different ip address.
0444	JRAlreadyConn
	The socket is already connected.
	Action: The socket is already connected to the partner socket. If the connection is not usable then close() the socket and establish a new socket connection.
0445	JRNotStream
	The socket operation is only valid for a stream socket.
	Action: The syscall did not complete successfully. Only use the socket service for a socket of type stream.
0446	JRSocketConDropped
	The socket connection was severed.
	Action: The socket connection was dropped. Re-establish the socket connection.
0447	JRMpMuProcess
	Operation not permitted in a Multiproc/Multiuser process.
	Action: The caller's process is in a multiprocess address space and has its own process level security environment. The operation is not permitted in this environment. Retry the operation again from a non-multiproc/multiuser environment.
0448	JRTLSCertIDLenInvalid
	The certificate structure has an incorrect length associated with it.
	Action: Verify the parameter containing the length of the certificate structure.
0449	JRTLSCertTypeInvalid
	The type of certificate used is not valid.
	Action: Verify the parameter containing the type of certificate and ensure it is a known type.

Value	Description
044A	JRTLSCertLengthInvalid
	The length of the certificate is not valid.
	Action: Check the parameter associated with the length of the actual certificate and ensure it is correct.
044B	JRNoINITACEE
	There is no SAF service available to manage a certificate authorization.
	Action: Install a security product that supports authorization via certificate.
044C	JRNoCertforUser
	There is no userid defined for this certificate.
	Action: Ensure the userid is known to the SAF service.
044D	JRCertInvalid
	The certificate is not valid to the security service.
	Action: Ensure this is a valid and correct certificate.
044E	JRKeepaliveTO
	The socket connection was severed.
	Action: The KEEPALIVE timer expired and the connection was dropped. Reestablish the socket connection.
044F	JRInetRecycled
	One of the Transport Providers was activated after the socket was opened.
	Action: This socket should be closed and restarted.
0450	JRSwapMismatch
	An attempt was made to make the address space swappable when no previous attempt to make the address space non-swappable was made.
	Action: Call service to make address space non-swappable before making it swappable.
0451	JRNoBacklogQ
	An accept() request was issued for a server socket that does not have a backlog queue.
	Action: A listen() was issued with a backlog queue size of less than or equal to zero. Issue a listen() with a backlog queue size greater than zero for the server socket in order to accept() connections.
0452	JRFunctionCode
	The function code for syscall is not valid.
	Action: Specify a supported function code
0453	JRIdentityType
	The identity type for the syscall is not valid.
	Action: Specify a supported identity type

Value	Description
0454	JRCertificate
	The security certificate was either not specified or the length was not valid.
	Action: Specify a valid certificate forlogin
0455	JRCwdPLusFileName
	The combined length of the CWD specified in the INHE and the filename parameter exceeded 1023 bytes.
	Action: Verify the length of the CWD specified in the INHE and length of the filename parameter when combined does not exceed 1023 characters.
0456	JRFileChangedDuringLoad
	The file or its attributes changed while the file was in the process of being loaded.
	Action: Retry the operation after any changes have been made to the file and its attributes.
0457	JRSecurityEnv
	The syscall is prohibited with the caller's current security environment.
	Action: The current task level security environment for the caller was not created vialogin. So,login can not be used to change the current security environment.
0458	JRStorNotAvail
	An address was specified which is not available.
	Action: The system tried to obtain storage on behalf of the request but the storage was not available. All or part of the storage was already allocated or the system would not permit it to be allocated.
0459	JRNotSegment
	A location specified or generated is not on a segment boundary.
	Action: Specify the address, length or offset in segment multiples.
045A	JRMmapTypeMismatch
	A request specified the MAP_MEGA option but was already mapped without the option or did not specify the MAP_MEGA option but was already mapped with that option.
	Action: Ensure all requests to map the same file specify compatible map_type options.
045B	JRWFileMapRDonly
	A request tried to write to a file that is mapped as read-only.
	Action: Remap the file for write or read/write access.
045C	JRPtTypeNotTried
	The entry in a ptrace PT_BlockReq request containing this value in the status field was not processed because of an unexpected error.
	Action: Retry the operation after ensuring that the request is valid. For example, ensure that a Write_Block request is not trying to write into protected storage.

Value	Description
045D	JRPtBadBlkReqStruc
	The PtBRInfo block or related structure passed as input for a ptrace Pt_BlockReq request is not valid.
	Action: Fix the PtBRInfo control block or related structure and retry the operation.
045E	JRPtSomeBlkedFailed
	One or more entries in a Pt_BlockReq request was not processed.
	Action: Check the status field of each entry in the PtBRInfo block to obtain the status of each request. At least one did not complete
045F	JRPtTypeNotBlockable
	The entry in a ptrace PT_BlockReq request containing this value in the status field was not processed because the type specified is not allowed in a blocked request.
	Action: Change the PtBRInfo block to not include unsupported request types.
0460	JRTargetPid
	A target pid specified is incorrect.
	Action: Reissue the request with a valid target pid.
0461	JRSignalPid
	A signal pid specified is incorrect.
	Action: Reissue the request with a valid signal pid.
0462	JRNoCallerPid
	The Signal_Pid or Target_Pid did not contain the pid of the caller.
	Action: Reissue the request with the Signal_Pid or Target_Pid equal to the caller's pid
0463	JRAnr
	Vnode operation ACCEPT_AND_RECEIVE is not supported by this file system.
	Action: Issue separate accept and receive operations with this socket.
0464	JRSrx
	Vnode operation SR_CSM is not supported by this file system.
	Action: Use regular send/receive type operations with this socket.
0465	JrWrongKey
	An error occurred during process signal initialization.
	Action: Kernel handling of async I/O can not be done if all callers do not run under the same key.
0466	JRPtBadBlkOffset
	A PtBRInfo entry has an offset that either points to within the PtBRInfo block or past the end of the area provided by the user.
	Action: Fix the PtBRInfo control block or related structure and retry the operation.

Value	Description
0467	JRSsetTooSmall
	The OldCount value supplied was too small to accommodate the number of built entries.
	Action: OldCount now contains the number of array elements needed. Reissue the call with the new OldCount value
0468	JRInvalidRange
	The NewCount or OldCount was greater than the maximum number of signals allowed.
	Action: Check NewCount and OldCount values making sure they are less than the maximum number of signals allowed and reissue the call.
0469	JRInvalidOption
	The option specified is not supported.
	Action: Reissue the request with a supported option.
046A	JRInvalidBinSemUndo
	The requested operation violates binary semaphore rules by specifying UNDO option.
	Action: Reissue the semaphore request without UNDO parameter for a binary semaphore.
046B	JRInvalidBinSemNumSemOps
	The requested operation violates binary semaphore rules by specifying more than one operation per semop.
	Action: Reissue the semaphore request with one operation per semop call.
046C	JRInvalidBinSemNotBinOp
	The requested operation violates binary semaphore rules by specifying too large a semop or semctl value for the semval.
	Action: Reissue the semaphore request with a valid semop or semctl SETVAL or SETALL value for a binary semaphore.
046D	JRInvalidBinSemFlag
	A semgt request matched an existing key or ID but theIPC_BINSEM flag operand does not match.
	Action: Reissue the semaphore request either with or without theIPC_BINSEM flag to match the existing semaphore set.
046E	JRInvalidBinSemSetAll
	A requested semctl SETALL is being done after a semop for aIPC_BINSEM semaphore set.
	Action: Do the semctl SETALL for aIPC_BINSEM semaphore set before doing any semop requests to the semaphore set.
046F	JRNegativeLength
	A negative length was specified for either the header length or trailer length on the SEND_FILE Syscall.
	Action: Correct the length and reissue the syscall.

Value	Description
0470	JRInValidOffset
	The offset parameter specified on the SEND_FILE syscall is not correct. It is either a negative number or it specifies an offset past the end of the file.
	Action: Correct the offset and reissue the syscall.
0471	JRTooManyBytes
	The FILE_BYTES parameter specified on the SEND_FILE syscall is larger than the file size.
	Action: Correct FILE_BYTES and reissue the syscall.
0472	JRSocketNonBlock
	The socket descriptor specified on the SEND_FILE syscall is a non-blocking socket. SEND_FILE requires a blocking socket.
	Action: Change the state of the socket from non-blocking to blocking, then reissue the SEND_FILE syscall.
0473	JRLocalSpawnNotAllowed
	A request to spawn a local child process could not be completed because of conflicting inheritance attributes. A local spawn request with options that affect the attributes of the address space is not allowed because this would affect the attributes of the current address space where the new process would be created. The spawn request specified an inheritance structure or environment variable settings that would have changed one or more of the following attributes of the address space: the region size, the memory limit, the time limit, accounting information, the user ID.
	Action: A local child process is required to be created when either the InheMustBeLocal flag in the inheritance structure is set on or when the value of the _BPX_SHAREAS environment variable is MUST. For spawns that must be local be sure the request does not specify any of the following attributes in the inheritance structure: InheSetRegionSz, InheSetMemLimit, InheSetTimeLimit, InheSetAcctData, InheSetJobname. In addition, be sure that the list of environment variables passed on the spawn request does not include a _BPX_USERID specification.
0474	JRInValidSFPLLen
	The SFPL_LENGTH parameter specified on the SEND_FILE syscall is not correct.
	Action: Correct SFPL_LENGTH and reissue the syscall.
0475	JRPtInvFPCWrite
	The value specified for writing into the Floating Point Control Register is not valid.
	Action: Reissue the PT_WRITE_FPR request with a valid value for the Floating Point Control Register.
0476	JRMaxAiocbEcb
	The maximum number of AIOCBs with user defined ECBs was exceeded on the requested function.
	Action: Reduce the number of AIOCBs with user defined ECBs.

Value	Description
0477	JRCertAlreadyDefined
	The certificate being registered/deregistered is already defined for another user.
	Action: See initACEE documentation.
0478	JrCertDoesNotMeetReq
	The certificate being registered/deregistered does not meet RACF requirements.
	Action: See initACEE documentation.
0479	JRLockFcnCode
	The value specified for the LockFcnCode parameter for the BPX1SLK service is not valid.
	Action: Reissue the BPX1SLK service call with a valid value for the LockFcnCode parameter.
047A	JRLockReqType
	The value specified for the LockReqType parameter for the BPX1SLK service is not valid.
	Action: Reissue the BPX1SLK service call with a valid value for the LockReqType parameter.
047B	JRLockType
	The value specified for the LockType parameter for the BPX1SLK service is not valid.
	Action: Reissue the BPX1SLK service call with a valid value for the LockType parameter.
047C	JRLockAddr
	The address specified for the LockAddr parameter for the BPX1SLK service is not a valid shared memory address.
	Action: Reissue the BPX1SLK service call with a valid shared memory address for the LockAddr parameter.
047D	JRLockToken
	The value specified for the LockToken parameter for the BPX1SLK service is not valid.
	Action: Reissue the BPX1SLK service call with a valid value for the LockToken parameter.
047E	JRLockedAlready
	The lock represented by the specified lock token is already in a held state.
	Action: Reissue the BPX1SLK service call at a later instance when the lock is no longer held.
047F	JRLockInUse
	The lock represented by the specified lock token is in use for a condition wait.
	Action: Reissue the BPX1SLK service call at a later instance when the lock is no longer in use.

Value	Description
0480	JRLockShmAcc
	The caller does not have read/write access to the shared memory in which the specified lock resides.
	Action: Change the access on the shared memory segment in which the lock resides to read/write access.
0481	JRLockNotOwner
	The calling thread does not own the lock represented by the specified lock token.
	Action: Change the application such that only the lock owning thread attempts to release the lock.
0482	JRLockMaxCntSys
	The maximum number of shared memory locks for the system have been initialized.
	Action: Reissue the BPX1SLK service call at a later instance when the number of shared memory locks is no longer at the system maximum.
0483	JRLockMaxCntThd
	The maximum number of shared memory locks for the calling thread have been obtained.
	Action: Reissue the BPX1SLK service call at a later instance when the number of obtained shared memory locks is no longer at the per thread maximum.
0484	JRLockMaxCntRecurse
	The maximum number of recursive lock obtains for a given lock has been reached.
	Action: Reissue the BPX1SLK service call at a later instance when the number of recursive shared memory lock obtains is not at the maximum.
0485	JRLockShmRemoved
	The specified lock cannot be obtained because it is in shared memory that has been removed.
	Action: A shared memory remove was done for the shared memory segment in which the lock resides. Further obtain requests cannot be honored.
0486	JRBadAioEcb
	An Ecb represented by AioEcbPtr in one of the input Aiocbs was found to be bad.
	Action: Find the offending Aiocb and correct the AioEcbPtr field to either contain zero or point to a valid ecb.
0487	JRNoPtSecEnv
	Only a thread level identity created with pthread_security_np (BPX1TLS) can be propagated over a socket.
	Action: Insure calling thread has a task level identity created with pthread_security_np() (BPX1TLS) and retry the connect() operation.

Value	Description
0488	JRMultiThreaded
	The requested service cannot be performed in an address space with multiple user threads.
	Action: The thread calling the service was not the JST (Job Step Task) or the JST has subtasks. Reissue the request from an address space with only a JST task.
0489	JrActAcceptUserid
	The active identity for the caller /process was propagated over a socket via accept(). The propagated identity must be cleaned up before another identity can be propagated.
	Action: Clean up the propagated identity by closing (BPX1CLO) the socket descriptor that was return by the accept() that caused the identity to be propagated. See setsockopt() (BPX1OPT) for details.
048A	JRLockTokenAddr
	The address specified in the LockTokenAddr parameter for the BPX1SLK service is not accessible.
	Action: Reissue the BPX1SLK service call with an address of a lock token area that is accessible to the calling program.
048B	JREnclaveErr
	While changing to an identity propagated by a socket an error occurred while attempting to join/leave the propagated enclave.
	Action: See your IBM service representative.
048C	JRNotInWLMEnclave
	The unit of work is not in a WLM enclave. BPX1WLM did not return an enclave token .
	Action: The parameter area is unchanged as the current unit of work is not in a WLM enclave.
048D	JRCSMfailure
	The get_buffer request to get a CSM buffer failed.
	Action: Contact your IBM service representative.
048E	JrMaxQueuedSigs
	Maximum number of queued signal exceeded by the invoking process.
	Action: Ask the system programmer or system administrator to increase the MAXQUEUEDSIGS parameter of the BPXPRMxx parmlib member.
048F	JrSigInfoLen
	The value specified for the SigInfo_Len parameter on a BPX1STW (sigtimedwait) syscall was not valid.
	Action: Reissue the BPX1STW (sigtimedwait) syscall with the correct length specified for the siginfo_t (BPXYSINF) area.

Value	Description
0490	JRLevelTooHigh
	The load module format of the target executable file is at a level higher than the current system supports.
	Action: Rebuild the target executable file so that it is compatible for the running system level.
0491	JRBpxoinitStarted
	The OMVS initial process must be started by the system. Do not use the START operator command to start the OMVS initial process.
	Action: Do not use the START operator command to start the OMVS initial process. It is started by the system.
0492	JRBpxoinitNotUid0
	The userid associated with system procedure, BPXOINIT, must have uid=0 in the OMVS segment in the security database.
	Action: Change the userid or the uid of the userid associated with system proc BPXOINIT to have uid=0 and then have the operator re-IPL to recover OMVS services.
0493	JRStickyBit
	A program with the sticky bit was found but it is not supported on this call.
	Action: When issued for a BPX1LOD, either do not specify a sticky program, or reset the option on the BPX1LOD call to allow sticky programs.
0494	JrMaxAsyncIO
	The maximum number of outstanding async I/O requests has been exceeded by the invoking process.
	Action: Ask the system programmer to increase the MAXQUEUEDSIGS or MAXFILEPROC parameters for the process. The Async I/O maximum is two times the sum of MAXQUEUEDSIGS, from the BPXPRMxx parmlib member, and the process's file limit, which comes from: the BPXPRMxx MAXFILEPROC value, or the user's RACF profile's OMVS segment FILEPROCMAX value, or a program specified RLIMIT_NOFILE value.
0495	JRNotPtCreated
	Invoking task is not pthread created.
	Action: The function must be run as a pthread-created thread. Reissue the function after correcting the error.
0496	JRNotPtSecurity
	The current task security environment is not set up via pthread_security_np.
	Action: The current task security environment must be set up via pthread_security_np. Reissue the function after correcting the error.
0497	JRAlreadyActive
	Requested function is already active.
	Action: The osenv_get/osenv_set request cannot be processed. A previous osenv_get/osenv_set is active. An osenv_unset must be issued before a new osenv_get/osenv_set can be issued again.

Value	Description
0498	JRSecActive
	Task level security environment already active.
	Action: One of the following error conditions occur:
	The osenv_set request cannot be processed. The osenv_set request specified security environment and the current task already has task level security active.
	<ul> <li>The pthread_security_np request cannot be processed. An osenv environment is already active with task level security specified.</li> </ul>
0499	JRInvOsenvTok
	Input osenv token is incorrect.
	Action: The input osenv token is invalid. Specify the same osenv token as returned on a osenv_get call. You may need to issue osenv_persist to ensure the osenv token stays valid.
049A	JRNoPersist
	Unpersist requested but persist count is 0.
	Action: The osenv_unpersist request cannot be processed. Either no osenv_persist was issued or all prior osenv_persist requests have been matched by a corresponding osenv_unpersist.
049B	JROsenvWlmMismatch
	osenv WLM Enclave membership does not match the current pthread WLM Enclave membership.
	Action: The Osenv_set function cannot be processed. One of the following conditions occur:
	<ol> <li>The osenv_WLM attribute is requested, but the task already has a WLM Enclave membership established which is different than the osenv WLM Enclave membership.</li> </ol>
	<ol><li>The osenv_WLM attribute is not requested, but the task already has a WLM Enclave membership established.</li></ol>
049C	JROsenvWrongEnclave
	Current task is not associated with the osenv WLM enclave.
	Action: The Osenv_unset function cannot be processed. The task has changed WLM Enclave membership since the time osenv_set joined the WLM Enclave associated with the osenv.
049D	JROsenvBeginEnvOutstanding
	The current task is operating under an outstanding WLM Begin environment. Enclave leave is not allowed.
	Action: The Osenv_unset function cannot be processed. The current task is operating under an outstanding Begin environment. Osenv_unset must be issued before issuing IWMSTBGN.

Value	Description
049E	JROsenvNotEjoinedTcb
	The current task did not issue WLM Enclave Join, but only inherited Enclave attribute from mother task.
	Action: The Osenv_unset function cannot be processed. The current task cannot issue osenv_set/osenv_unset in this environment.
049F	JROsenvEnclaveSubTaskExists
	The current task has residual subtasks propagated to the enclave which are still associated with the Enclave.
	Action: The Osenv_unset function cannot be processed. Ensure the subtasks are ended before issuing the osenv_unset function.
04A0	JROsenvSecurityMismatch
	The current security environment does not match the value specified in the osenv token.
	Action: The Osenv_unset function cannot be processed. The security environment cannot be changed between osenv_set and osenv_unset. Ensure that the osenv token used was the one returned on the osenv_get.
04A1	JROsenvNotActive
	Osenv environment is not active.
	Action: The osenv_unset, osenv_persist, or osenv_unpersist functions cannot be processed. Osenv_get or osenv_set must be issued before the osenv_unset, osenv_persist or osenv_unpersist functions. Osenv_unpersist can be issued together with osenv_set. If issued alone, it must be issued before osenv_unset.
04A2	JROsenvPersistCntBad
	There are no outstanding persist requests.
	Action: The Osenv_unpersist function cannot be processed. The current persist count is 0. Osenv_persist must be issued before the osenv_unpersist function.
04A3	JRWlmJoinError
	Bad return code from IWMEJOIN macro.
	Action: The IWMEJOIN macro failed. Check for WLM reported errors. Retry the osenv system call.
04A4	JRIwmeleavError
	Bad return code from IWMELEAV macro.
	Action: The IWMELEAV macro failed. Check for WLM reported errors. Retry the osenv system call.
04A5	JrNotSupInSysplex
	In sysplex, for remount to be supported, all systems must be at a release that provides remount support. In sysplex, unmount drain is tried as unmount normal, but if it cannot complete, an error is returned.
	Action: Remount can be replaced with unmount followed by mount. Unmount drain can be replaced by looping on unmount normal until it successfully completes.

Value	Description
04A6	JrSysplexRecoveryInProg
	An unmount or some file system command was attempted while sysplex system recovery was in progress.
	Action: Try again later.
04A7	JrMustBeImmed
	An unmount was attempted in a sysplex for a filesystem that is unowned, and Immed was not specified.
	Action: Do an unmount immed.
04A8	JrResetAlreadyInProg
	Unmount reset is already in progress.
	Action: None
04A9	JrInvalidSize
	Buffer received by mount was too small.
	Action: Reissue the command with a correct size buffer.
04AA	JrUnknownBlock
	Control block received is unrecognized.
	Action: The data structure in the buffer did not have an eye catcher identifier. Place this into the structure and try the command again.
04AB	JrBadCombo
	Conflicting values have been received.
	Action: Values for the chmount request conflict. Adjust the data structure to remove the conflicts. Reissue the request.
04AC	JrNoWildFromSys
	Conflicting values have been received.
	Action: The FROMSYS specification in the MNTE cannot be an asterisk. Reissue the request for a specific FROMSYS.
04AD	JrNoValues
	No values for the chmount request have been given.
	Action: Insufficient data was available in the MNTE to construct a chmount request.
04AE	JrMustBeSysplex
	This request only possible in a sysplex environment.
	Action: This request can only be accepted in a sysplex environment. The issuing environment was not sysplex. There is no further action.
04AF	JrAttemptsExhausted
	Every attempt to move the filesystem has failed.
	Action: Every attempt to move this file system has ended in failure. All possible locations to move the file system has been tried. It cannot be moved.

Value	Description
04B0	JrLostState
	The filesystem can no longer be moved by this process.
	Action: The filesystem can no longer be moved because the CDS no longer indicates that this process can move it.
04B1	JrNoFROMSYS
	The system specified as the FROMSYS can not be found.
	Action: Reissue the command with a new FROMSYS specified.
04B2	JrNoFSFound
	The filesystem requested to be moved can not be found.
	Action: Reissue the command with a filesystem that can be found.
04B3	JrInRecovery
	A required file system is being recovered.
	Action: Retry the operation later.
04B4	JrNoMountPointFound
	The mountpoint requested to be moved can not be found.
	Action: Reissue the command with a mountpoint that can be found.
04B5	JrBlackHole
	Filesystem is unowned.
	Action: A filesystem that is unowned can not be moved.
04B6	JrNoPlace
	This filesystem can not be placed.
	Action: A filesystem was requested to be moved to and it is not possible to do so. The reason can be that the filesystem was requested to be moved to the system it was already on. This is considered an error. Alternatively, the reason can be that the filesystem was requested to be moved to any other system in the sysplex and no eligible system was found to accept this filesystem.
04B7	JrNoSystemFound
	There is no system with that name.
	Action: Reissue the command with a system name that can be found.
04B8	JrSysplexDataSyncLost
	The I/O request is rejected because the file integrity was lost due to the failure of the file system server.
	Action: Close the file and re-open it.
04B9	JrTdGone
	The socket Transport Driver has terminated and restarted.
	Action: Close the socket and re-open it, or restart the application program.

Value	Description
04BA	JrNoDeviceFound
	There is no longer any device with that device number.
	Action: Reissue the command.
04BC	JrNotMoveable
	This filesystem can not be moved.
	Action: Some file systems can not be moved from one system to another. Check that the filesystem you intended to move is the one that was requested.
04BD	JrNoLongerServer
	The server detected it is no longer the server.
	Action: The server has determined that it is no longer the server for the filesystem to be moved. Reissue the command.
04BE	JRLockCtl
	The lockctl service vnode operation is not supported.
	Action: Verify that the operation was performed on a physical file system that supports the operation.
04BF	JRCPLNotAuth
	cpl service call failed permission check for BPX.CF facility class profile.
	Action: Caller must be given read permission to BPX.CF facility class profile in order to use thecpl service successfully.
04C0	JRCPLInvFcnCode
	cpl service call failed because the supplied function code is not valid.
	Action: Reissue thecpl service call with a valid value for the Function Code parameter.
04C1	JRCPLInvBuffLen
	cpl service call failed because the supplied buffer length is not valid.
	Action: Reissue thecpl service call with a valid value for the buffer length parameter.
04C2	JRCPLBuffTooSmall
	cpl service call failed because the supplied buffer was too small for the data to be returned.
	Action: Reissue thecpl service call with a buffer large enough to hold the data returned from IXCQUERY or IXLCSP.
04C3	JrSysplexBlackHoleIO
	The I/O request is rejected because access to the owning file system was lost. This is a temporary condition.
	Action: Close the file and re-open it.

Value	Description
04C4	JrSysplexRecoveryTO
	Filesystem recovery timeout. One or multiple file systems may not have been recovered, and are thus black holes.
	Action: See your IBM service representative.
04C5	JRCPLInvStrucType
	cpl service call failed because one of the supplied structure entries is defined with an incorrect type.
	Action: Reissue thecpl service call with a valid type for all supplied structure entries.
04C6	JRCPLCFNotFound
	cpl service call failed because a Coupling Facility at the appropriate level (level 8 or greater) could not be found in the sysplex where thiscpl callable service routine is running.
	Action: Reissue thecpl service call in a sysplex that has a Coupling Facility at the appropriate level.
04C7	JRShrLibNotAuthorized
	The chattr function can not be performed to change the shared library attribute because the caller is not permitted to the BPX.FILEATTR.SHARELIB facility class.
	Action: If the user is allowed to use chattr to change the shared library attribute, the user must be permitted to the BPX.FILEATTR.SHARELIB facility class.
04C8	JROutOfAutomountEntries
	The system is unable to obtain an entry in the file system automount table in the OMVS couple data set.
	Action: Either reduce the number of automount rules, or create a new OMVS couple data set which supports a larger number of rules. The system programmer will need to run the XCF couple data set format utility for TYPE(BPXMCDS) to increase the number of AMTRULES supported then issue the SETXCF COUPLE operator command to add the new OMVS couple data set as the alternate and then PSWITCH to make the alternate couple data set the primary couple data set for OMVS.
04C9	JRNeedAbsPath
	An absolute path name must be used when performing a mount command from a userid that has changed roots.
	Action: Reissue the command from an environment where the user has not changed root or specify a full path name on the invocation of the syscall.
04CA	JrMapBadFunction
	TheMap function or sub-function code was not valid.
	Action: Specify a valid function code.
04CB	JRNotAuthMAP
	map_init call failed permission check for BPX.MAP facility class profile.
	Action: Caller must be given read permission to BPX.MAP facility class profile in order to use themap service successfully.

Value	Description
04CC	JRBadBlkAddr
	map service was passed a bad block address. The block address specified was not within the map area, or was not on a block boundary.
	Action: Ensure that block address are valid.
04CD	JRMapAlreadyActive
	map_init requested for a process that already had anmap environment active.
	Action: Determine why the application attempted to initialize anmap environment when one was already active and correct it.
04CE	JRMapOutOfBlocks
	map service, processing for a new block or connect request, was asked to select a map block that was not currently in use, but none was available as all blocks were currently in use.
	Action: Increase the number of blocks in the map area or disconnect from at least one map block.
04CF	JRMapNotActive
	map service was requested but either no map environment is active or the current map environment is being shut down.
	Action: You must either start a map environment or wait for the current map environment to complete shut down and then start a new map environment prior to issuing more requests.
04D0	JRMapTokenNotFound
	map service data block token not defined.
	Action: That token is not defined because either it is not valid or it was valid at one time but has been previously freed.
04D1	JRMapBlockNotInUse
	map service disconnect is issued for a map block that is not currently in use.
	Action: This may be caused by an application disconnecting from a block that is not currently connected, or disconnecting from the same block more than once.
04D2	JRMapBlockInUse
	map service new block or connect specified a map block that is currently in use.
	Action: Ensure a map block is disconnected before the map block is re-used.
04D3	JRMapBlockFreePending
	map service connect request specified a data block that is currently being freed.
	Action: Do not free a block before all users have finished with it.

Value	Description
04D4	JRMapBadStorage
	The parameter list either could not be accessed or was in read only storage and could not be updated.
	Action: The application provided a parameter list that is not useable do to storage key problems. The application should ensure that a valid storage address and valid storage are provided to themap service.
04D5	JRMapUnexpectedErr
	An error occurred in anmap service.
	Action: See your IBM service representative.
04D6	JRReservedValueInvalid
	A reserved field contained a value other than zero.
	Action: Clear the parameter list prior to filling it in to call the service or insure you are not setting fields incorrectly.
04D7	JRMapArrayCountErr
	The array count was outside the valid values.
	Action: Reduce the number of array entries in the parameter list to themap_service function.
04D8	JrNotClient
	This system is not a client of the requested filesystem.
	Action: This osi_xmsg request must come from a client.
04D9	JrJointMsgSent
	The joint LFS/PFS message requested for osi_xmsg to send has already been sent.
	Action: A joint message can only be sent once.
04DA	JRNoWildAutoMove
	The automove setting can not be changed while moving a collection of filesystems.
	Action: Reissue the move of the collection of filesystems without the automove specification.
04DB	JRInvalidFSP
	The file does not have a valid FSP.
	Action: Until a valid FSP is reestablished, actions requiring authorization cannot be performed on this system.
04DC	JrNoRoot
	The user home directory did not exist or there is no system root mounted.
	Action: If there is no system root the DISPLAY OMVS,MF console command can be used to show mount failures that have occurred. Correct any problems and mount a file system on /. Otherwise, insure that the HOME() directory specified in the OMVS segment of the user profile exists. Note: z/OS UNIX can be used without a HOME directory but all file system references must be made with absolute path names until a successful change directory, cd command or chdir() function, is performed.

Value	Description
04DD	JRMoveInProgress
	The filesystem is in the process of being moved to a different server.
	Action: Try again later.
04DE	JRBadBodyLength
	The MNTE2 does not have a correct body length coded into the body length field in the MNTE header.
	Action: Recode the BodyLength field to have the length of the MNTE body control block structure that is being used.
04DF	JRXcfNoStorage
	I/O buffer shortage for writing data through XCF.
	Action: The maximum number of I/O buffers for writing message data through XCF has been exceeded. Ask the system programmer or system administrator to sufficiently increase the MAXMSG parameter of the COUPLExx parmlib member. If the error persists, contact your IBM service representative.
04E0	JrPFSFailed
	A PFS returned a RetVal of -1 with an errno and errnojr of zero.
	Action: The operation has failed. If this was an unmount, do an unmount force.
04E1	JRPtInvGPRHNumber
	The ptrace call has an incorrect general register number.
	Action: A debugger program tried to read or write a general purpose high register, but supplied an incorrect register number. Ensure that a valid register number is supplied on the ptrace request. The register numbers are defined in the BPXYPTRC macro.
04E2	JRFiletooLarge
	File size exceeded the value that can be held in object of type off_t.
	Action: Rework the program to use a larger data type.
04E3	JRCantExpClient
	V_export of a sysplex client file system is not allowed.
	Action: Export the file system from the sysplex system that owns it.
04E4	JRIsExported
	Moving a file system that is exported is not allowed. Remounting an exported filesystem to a mode where it would then be exported on a served client is not allowed.
	Action: Unexport the file system first and then move or remount it.
04E5	JrFsQuiescedMt
	A file system operation was rejected because the owning file system is quiesced and the operation cannot be delayed.
	Action: Retry the operation after the file system is unquiesced.

Value	Description
04E6	JrMptFsQuiesced
	A mount request was rejected because a file system in the mount path is quiesced.
	Action: Retry the mount operation after all file systems in the mount path are unquiesced.
04E7	JrMmapSuspended
	A memory map request was rejected because the memory map function is suspended.
	Action: An unrecoverable error caused the memory map function to be suspended until the next IPL. Retry the memory map request after the IPL.
04E8	JrSfsDiagAct
	A Shared-FS diagnostic operation is already in progress.
	Action: Retry the operation after the current Shared-FS diagnostic function completes.
04E9	JRInvalidFileTag
	The file tag supplied is invalid.
	Action: When the file text flag is on, the Coded Character Set Id should not be 0 or hex FFFF.
04EA	JrDOMParms
	The CCADOMToken and CCAMsgIdList are mutually exclusive, both were specified.
	Action: Retry the operation with either CCADOMToken or CCAMsgIdList, not both.
04EB	JrTooManyMsgIDs
	The maximum number of messages that can be deleted in one operation is 60, more then 60 were specified.
	Action: Retry the operation with with 60 or less messages specified in the list pointed to by CCAMsgIdList.
04EC	JrAuthRoutingCode
	An unauthorized caller (not UID=0) specified a message routing code reserved for authorized caller.
	Action: Retry the operation with routing codes 1-28.
04ED	JrRoutCode
	An invalid message routing code was specified.
	Action: Correct the problem and retry the operation. Valid message routing codes are 1-28 for unauthorized and 1-128 for authorized caller's.
04EE	JrDescCode
	An invalid message descriptor code was specified.
	Action: Correct the problem and retry the operation. Valid message descriptor codes are 1-13.

Value	Description
04EF	JrRoutingList
	All or part of the list of routing codes pointed to by CCARoutCdeList is not addressable by the caller.
	Action: Correct the addressability problem with the list of message routing codes and retry the operation.
04F0	JrDescList
	All or part of the list of descriptor codes pointed to by CCADescList is not addressable by the caller.
	Action: Correct the addressability problem with the list of message descriptor codes and retry the operation.
04F1	JrMsgIdList
	All or part of the list of message ids to be deleted pointed to by CCAMsgIdList is not addressable by the caller.
	Action: Correct the addressability problem with the list of message ids and retry the operation.
04F2	JrTooManyRoutCodes
	The maximum number of routing codes that can be specified is 128 but was exceeded.
	Action: Retry the operation with 128 or less routing codes specified in the list pointed to by CCARoutCdeList.
04F3	JrTooManyDescCodes
	The maximum number of descriptor codes that can be specified is 6 but was exceeded.
	Action: Retry the operation with 6 or less descriptor codes specified in the list pointed to by CCADescList.
04F4	JrMsgId
	All or part of the location specified by the caller for the returned message id (CCAMsgIDPtr) is not addressable by the caller.
	Action: Correct the addressability problem with the location for the message id and retry the operation.
04F5	JrSysplexEnq
	The ENQ for file system sysplex serialization is already held by another local task or by another system in the sysplex.
	Action: See your IBM service representative.
04F6	JrLfsProtocolLev
	The function could not be performed because the minimum required LFS protocol level was not met by all systems in the sysplex group.
	Action: See your IBM service representative.

Value	Description
04F7	JrMemberListBad
	An inconsistency between the XCF representation of the BPXGRP member group and the local representation exists.
	Action: This system should be restarted. Contact your IBM service representative.
04F8	JRRcvBufTooSmall
	A message will not fit in the receive buffer. The size of the receive buffer for the receiving socket, which was set by the setsockopt syscall with the so_rcvbuf option, is too small to contain the data being sent to it. Truncation would occur.
	Action: The sending application must reduce the size of the message being sent to the receiving socket or the receiving application must use the setsockopt syscall with the so_rcvbuf option to increase the size of the receive buffer for the receiving socket.
04F9	JRMutualExclInProgress
	Mutually-exclusive operations are currently in progress in the sysplex. The request cannot proceed.
	Action: MODIFY BPXOINIT, FILESYS = DISPLAY can be used to display status of systems in the sysplex.
04FA	JRUnmountAllInProg
	MOUNT cannot proceed because UNMOUNTALL is in progress. UNMOUNTALL can be caused by various scenarios such as MODIFY BPXOINIT, FILESYS=UNMOUNTALL and MODIFY OMVS, STOPPFS.
	Action: Retry the MOUNT later.
04FB	JrQuiesceInProg
	A pthread quiesce operation is already in progress.
	Action: The pthread_quiesce_and_get_np function cannot be performed at this time due to conflicts with other quiesce operations currently in progress. Retry the operation after the current operation completes.
04FC	JrRequestTypeErr
	The request type contains an incorrect value.
	Action: The request type contains an unsupported value. Correct the error and retry the operation
04FD	JrNoFreezeExit
	The pthread_quiesce_and_get_np service (BPX1PQG) cannot be performed because the Quick_freeze_exit has not been registered.
	Action: Use the oe_env_np (BPX1ENV) service, function code of QUICK_FREEZE_EXIT_REG to register a user exit, before issuing the pthread_quiesce_and_get_np service.
04FE	JrNotExitKey
	The PSW key of the caller is not same as key registered under Quick_freeze_exit.
	Action: The caller must run in same PSW key as registered under the QUICK_FREEZE_EXIT_REG function of the BPX1ENV service. Verify that the Quick_Freeze_Exit was registered with the proper PSW key.

JRInvThdq
Incorrect quick pthread quiesce data structure.
Action: The input data structure (mapped by BPXYTHDQ) specified on the pthread_quiesce_and_get_np service contained one or more errors:
<ul> <li>address of the BPXYTHDQ data structure is incorrect</li> </ul>
incorrect eye-catcher
<ul> <li>number of threads specified = 0</li> </ul>
<ul> <li>size of data structure is smaller than the number of specified threads</li> </ul>
data structure not on word boundary
Correct the program and rerun.
JRNotFrozen
A pthread_quiesce_and_get_np (BPX1PQG) unfreeze_all request cannot complete because the process is not frozen.
Action: Use the pthread_quiesce_and_get_np service to freeze the threads before using the pthread_quiesce_and_get_np service with a request type of THDQ_UNFREEZE_ALL.
JRQFrzExitError
A pthread_quiesce_and_get_np (BPX1PQG) service call failed because the language environment quick freeze exit abnormally ended.
Action: Contact your IBM service representative.
JRExitAlreadyReg
The quick freeze exit has already been registered.
Action: The QUICK_FREEZE_EXIT_REG function of the oe_env_np (BPX1ENV) service cannot be performed because an exit different than the requested has already been registered.
JRCannotDeregister
The quick freeze exit cannot be deregistered.
Action: The request to deregister the quick freeze exit for pthread_quiesce_and_get_np using the oe_env_np (BPX1ENV) service cannot be performed. The exit cannot be deregistered (by specifying a zero exit address).
JRRequestorThread
The requestor thread cannot be frozen.
Action: A pthread_quiesce_and_get_np (BPX1PQG) service call failed because the requesting thread is on the list of threads to be frozen. The requesting thread cannot be frozen.
JRThdsNotSafe
Specified threads cannot be frozen in a safe state.
Action: A pthread_quiesce_and_get_np (BPX1PQG) service call failed because one or more of the listed threads cannot be frozen in a safe state. Try the request again.

Value	Description
0506	JRDupThreads
	Duplicate threads specified in data structure.
	Action: A pthread_quiesce_and_get_np (BPX1PQG) service call failed because one or more of the listed threads have duplicate entries in the input data structure. Correct the program and rerun.
0507	JrSysEntryBad
	An inconsistency between the XCF representation and the file system representation of a member in the BPXGRP group exists.
	Action: The analysis and repair of the file system hierarchy ends prematurely. Partition cleanup is initiated for the named system. Issue the MODIFY BPXOINIT, FILESYS=DISPLAY, GLOBAL system command to determine if partition cleanup processing is complete. Partition cleanup is complete when there are no systems performing LOCAL FILE SYSTEM RECOVERY or FILE SYSTEM TAKEOVER RECOVERY. When partition cleanup has completed, re-issue the MODIFY BPXOINIT, FILESYS=FIX command to resume and complete file system diagnostic and repair processing. If the inconsistency persists for the named system, a sysplex restart may be required.
0508	JRFileNotEmpty
	The file is not empty.
	Action: The file must be empty for this particular combination of syscall parameters. For example, opening an existing file and specifying deferred file tagging is not allowed.
0509	JRNoDelRequested
	The directory does not allow unlinks.
	Action: The directory on which the file resides has had a chattr request specifying that files within the directory are not to be deleted issued against it.
050A	JrConversionErr
	Unicode/390 conversion error.
	Action: The read or write operation failed when converting between different CCSIDs.
050B	JrUnconvertibleChar
	Character is not convertible.
	Action: A read or write operation failed while converting between CCSIDs. Either an invalid character was encountered, or the character was incomplete for the given CCSID.
050C	JrInvalidCcsid
	CCSID not supported.
	Action: A CCSID specified is not supported. If a read or write operation was active, then the Unicode/390 environment was not set up to allow conversion between the program's CCSID and the file's CCSID.

Value	Description
050D	JrConversionEnv
	Unicode/390 environmental error.
	Action: Unicode/390 services were required for the operation, and either the service failed or was not set up. Determine if Unicode/390 initialized properly, and check for a Unicode/390 error message or dump.
050E	JrUnknownConversion
	Unicode/390 environmental error.
	Action: Unicode/390 services were required for the operation, and a previous Iseek operation changed the position from which to read a multi-byte character file. This read operation is invalid because the character state is now unknown.
050F	JrNoTaskACEE
	Invoker must have task level ACEE.
	Action: Invoke pthread_security_np(TLS_TASK_ACEE#) only when invoker has a task level ACEE
0510	JrNotWLMACEE
	ACEE must be WLM created.
	Action: Invoke pthread_security_np(TLS_TASK_ACEE#) only when the ACEE is WLM created
0511	JrTLSDONEONIPT
	IPT already invoked TLS_TASK_ACEE#.
	Action: Invoke pthread_security_np(TLS_TASK_ACEE#) only when IPT has not invoked TLS_TASK_ACEE#
0512	JRInvEcbPtr
	The ECB pointer is not a 31-bit address.
	Action: The ECB must reside below the 2G bar. If a 64-bit pointer is passed, the upper word must be zeroes. Retry the request specifying a valid ECB pointer.
0513	JRAmode64
	Invalid addressing mode.
	Action: This release does not support AMODE(64).
0514	JRExecExitAboveBar
	Exec user exit is above the bar.
	Action: The EXEC user exits can not reside above the BAR. Retry the request with the user exit loaded below the BAR.
0515	JRInvalidMedWtAmode
	Medium weight process can not change AMODE.
	Action: Since LE can not handle dynamic AMODE changes, requests for an AMODE change on a medium weight process will not be allowed.

Value	Description
0516	JrNeedMountLatch
	BPXXCDSS service invoker must hold mount latch.
	Action: See your IBM service representative.
0517	JrBadLfsVersion
	LFS Version incompatibility exists.
	Action: See your IBM service representative.
0518	JRAlreadyInShutDown
	The block or permanent process cannot be registered.
	Action: The request to register a blocking process or job, or a request to register a permanent process or job, using the oe_env_np (BPX1ENV) service cannot be performed. A shutdown is currently in progress.
0519	JRBlockPermAlreadyRegistered
	The process or job is already registered.
	Action: The request to register a blocking process or job, or a request to register a permanent process or job, using the oe_env_np (BPX1ENV) service cannot be performed. The job or the current process is already registered.
051A	JRBlockPermNotRegistered
	The process or job is not registered.
	Action: The request to deregister a blocking process or job, or a request to deregister a permanent process or job, using the oe_env_np (BPX1ENV) service cannot be performed. The job or the current process is not registered.
051B	JRJobNameNotValid
	The Job Name was not found.
	Action: This reason code is returned for one of the following reasons:
	<ul> <li>The request to register a blocking process or job, or a request to register a permanent process or job, cannot be performed because the JOB name does not exist.</li> </ul>
	<ul> <li>A z/OS Communications Server Real-time application-controlled TCP/IP trace NMI request could not find the TCP/IP stack specified by or associated with a trace instance.</li> </ul>
	<ul> <li>For an RCCOpen request, verify that the TCP/IP stack name specified in input field RCOPStack is correct.</li> </ul>
	<ul> <li>For all other requests, verify that the token in field RCHRToken in the input RCCHeader is correct.</li> </ul>
051C	JRJSTMustBeRegistered
	The Job Step Process must be registered.
	Action: The callable service is rejected, because the job step process must be registered prior to registering a lower process or the job step process can not be re-registered while a lower process is still registered.

Value	Description
051D	JRNotAuthShutdown
	SHUTDOWN_REG call failed permission check for BPX.SHUTDOWN facility class profile.
	Action: Caller must be given read permission to BPX.SHUTDOWN facility class profile in order to use the new registration function service successfully.
051E	JRUnsupportedEnv
	Caller attempted to call a z/OS UNIX Service in an unsupported environment.
	Action: Caller cannot call z/OS UNIX Services in this environment. An example of an unsupported environment is a PFS Task running inside the OMVS address space. The function must be performed from an environment that is supported.
051F	JrPidInvalid
	Pid specified for _BPXK_PIDXFER is invalid.
	Action: The PID specified with the _BPXK_PIDXFER environment variable was determined to be invalid. A PID is considered invalid if it contains a non-decimal EBCDIC character (0-9) or is longer then the maximum allowable PID (>10 characters).
0520	JrPidOutOfRange
	Pid specified for _BPXK_PIDXFER is out of range.
	Action: The PID specified with the _BPXK_PIDXFER environment variable is out of the allowable range. A PID for a PIDXFER type exec must be between 2 and 4294967294 (inclusive).
0521	JRXferPidNotFound
	Pid specified for _BPXK_PIDXFER could not be found.
	Action: The PID specified with the _BPXK_PIDXFER environment could not be found. Ensure the target PID for a PIDXFER type exec is still active.
0522	JRNoPidXfer
	The caller is not authorized to debug the target process specified by the _BPXK_PIDXFER environment variable.
	Action: Determine the authorization required to debug a process and retry the request. For details on the authorization required refer to the IRRSPT00 SAF callable service.
0523	JRPidXferNoExtLink
	External Links are not allowed with PidXfer.
	Action: The program specified in the _BPXK_PIDXFER environment is not supported because it is an external link.
0524	JRPidXferSameAS
	Pid specified for _BPXK_PIDXFER is available.
	Action: The PID specified with the _BPXK_PIDXFER environment is active in the current address space.

Value	Description
0525	JRPidXferAsyncFail
	An asynchronous request for this Pid failed.
	Action: The PID specified with the _BPXK_PIDXFER environment is terminating.
0526	JRNoPidXferDefUids
	Cannot PIDXFER when both PIDs have default userid.
	Action: The PID calling BPX1EXC and the target PID specified by _BPXK_PIDXFER are using the default user identity, PIDXFER is not permitted in that environment
0527	JrRestartedFd
	The file descriptor is left over after OMVS Restart.
	Action: The callable service is rejected because the descriptor was opened in a prior instance of OMVS. Close the descriptor and reopen the file or socket.
0529	JRInvBuffSize
	The length of the buffer is not valid.
	Action: The total buffer length specified for this request is too big. Retry the request specifying a valid buffer length. If this is a socket receive request, and MSG_PEEK and MSG_WAITALL are specified, the buffer size cannot exceed 65 535.
052A	JRInvSendBuffSize
	The send buffer size is not valid.
	Action: The total buffer length specified for the send request exceeds the limit for a datagram socket. Retry the request specifying a valid buffer length.
0528	JRPXNoMpMu
	Cannot PIDXFER to multi-process/multi-user address space.
	Action: The target PID for a PIDXFER resides in an address space that has multiple processes and multiple user identities, PIDXFER is not permitted in that environment
052B	JROnePXOnly
	Only one PIDXFER process allowed per address space.
	Action: The target PID for a PIDXFER resides in an address space that was already the target of a PIDXFER, only one PIDXFER process is permitted in an address space.
052C	JRPXExecFileTooBig
	The size of the specified file exceeds the private region of the PidXfer target address space.
	Action: The exec service detected that the size of the executable to be run exceeds the size of the PIDXFER target's address space private region.
052D	JRPXNoSpace
	Not enough virtual storage available in the target PIDXFER address space.
	Action: During exec PIDXFER processing it was determined that the target address space did not contain enough private virtual storage to support another process. PIDXFER requires at least 512K of private storage available below the line and 64M of private storage available above the line.

Value	Description
052E	JRInheMemLimit
	MemLimit size specified in Inheritance structure is not valid.
	Action: Re-issue Spawn with a valid MemLimit Size in the Inheritance Structure.
052F	JR64BitNotSupp
	Transport does not support 64-bit addresses.
	Action: See your IBM service representative.
0531	JRCinetNotAttached
	The Cinet is configured and this name does match a stack but that stack is not attached to this socket.
	Action: Check the permitted values specified for the stack. Display OMVS,PFS in the console to list all the stacks currently configured.
0532	JRNoCinet
	Name does not match, but Common Inet is not configured, or this is not a socket, so this error may not matter to the application.
	Action: The Ioctl could be sent directly to the only stack.
0533	JRCinetBadName
	The Cinet is configured and this name does not match any stack.
	Action: Check the permitted values specified for the stack. Display OMVS,PFS in the console to list all the stacks currently configured.
0534	JRFilesLocked
	Command not allowed because one or more applications have byte range locks on files in the filesystem.
	Action: The filesystem command (such as SETOMVS FILESYS) will be prevented until all locking applications have closed those files in the filesystem for which they issued byte range lock commands.
0535	JRNoIPv6Stacks
	There are no TCPIP stacks currently supporting IPv6.
	Action: For the socket() function there must be at least one IPv6 Stack active on the system. For other functions there must be at least one IPv6 stack attached to the socket. Check the permitted values specified for the stack. Display OMVS,PFS in the console to list all the stacks currently configured. If IPv6 has recently been configured via SETOMVS you may need to recycle the TCPIP stack(s).
0536	JRMedProcTerm
	Call to BPX1MPC for this medium weight process failed because the process is already in termination.
	Action: See your IBM service representative.

Value	Description
0537	JrNoListAuthPgmPath
	There is no authorized program path list entry.
	Action: The authorized program path used in this call was not listed in the sanction list referred to by AUTHPGMLIST. Update the sanction list.
0538	JrNoListPgmCntlPath
	There is no program control path list entry.
	Action: The program control path used in this call was not listed in the sanction list referred to by AUTHPGMLIST. Update the sanction list.
0539	JrNoAPFPgmName
	There is no APF Program name entry.
	Action: The APF program name used in this call was not listed in the sanction list referred to by AUTHPGMLIST. Update the sanction list.
053A	JrAfNotRightForSocket
	The address family specified in the sockaddr does not match the address family of the socket.
	Action: Correct the program to build a sockaddr structure that is appropriate for the address family of the socket being used.
053B	JrTdOptGone
	The stack chosen by the IPv6 option or by the IPv4 option is not active on this socket.
	Action: The function choose a stack with the IPV6_PKTINFO ancillary data item, IP_PKTINFO ancillary data item, sockaddr scope id, or socket options of IPV6_PKTINFO or IPV6_MULTICAST_IF and that stack is not attached to this socket. The stack may have been recycled since setsockopt() was called or the interface index used may be wrong.
053C	JrV6OnlyOnOnly
	The IPV6_V6ONLY socket option may only be turned ON.
	Action: Once setsockopt(IPV6_V6ONLY) is turned on it may not be reversed in this implementation.
053D	JrBadArgValue
	The argument value passed to the function is not within the range allowed.
	Action: Check the allowed values and correct the call.
053E	JrPreProcInitExitReject
	A Pre-Process Initiation exit rejected the process initiation.
	Action: Check all Pre-Process Initiation exits why this process was rejected.
053F	JrPreProcInitExitAbend
	A Pre-Process Initiation exit Abended.
	Action: Check all Pre-Process Initiation exits to find out why the exit Abended.

Value	Description
0540	JrPosProcInitExitAbend
	A Pos-Process Initiation exit Abended. was in error.
	Action: Check all Pos-Process Initiation exits to find out why the exit Abended.
0541	JrPreProcInitExitERROR
	A Pre-Process Initiation exit CSVDYNEX call was in error.
	Action: See your IBM service representative.
0542	JrPosProcInitExitERROR
	A Pos-Process Initiation exit CSVDYNEX call was in error.
	Action: See your IBM service representative.
0543	JrInvalidSyslist
	The system list is not valid.
	Action: Verify that the number of items in the syslist is correct according to the length provided. The minimum number of entries is 1 and the maximum is 32 system names. If a wildcard was entered, it must be the last item in an include system list.
0544	JrMountRedirected
	The mount request has been redirected to another system.
	Action: The file system is not accessible from this system at this time, however the mount was redirected to another system and should be mounted on this system shortly. Wait for a short duration and then check to determine if the file system is locally mounted.
0545	JRInvIoctlArg
	The argument value used in the ioctl is not valid for the command.
	Action: Check the permitted values for the ioctl command.
0546	JRInvIoctlArgLen
	The length of the argument used with the ioctl command is not valid for the command.
	Action: Check the permitted values for the ioctl command.
0547	JrDefUidNotAllowed
	The function is failed because it is not allowed from a user using the default OMVS segment.
	Action: Do not use the service.
0548	JrZeroScopeTdx
	The Scope_Id has a zero Cinet Transport Driver Index.
	Action: With IPv6 sockets in a Common Inet configuration whenever a non-zero Scope_Id is specified in a sockaddr the Cinet Td Index, in the Scope_Id's upper half word, must also be specified. Correct the program.

Value	Description
0549	JrZeroIfTdx
	An Interface Index has a zero Cinet Transport Index.
	Action: With IPv6 sockets or IPv4 sockets in a Common Inet configuration whenever a non-zero Interface Index is specified on a socket option or sendmsg ancillary data item the Cinet Td Index, in the Interface's upper half word, must also be specified. Correct the program.
0550	JrDevNsTerm
	The device has been closed following an namespace termination.
	Action: See your IBM service representative.
054A	JrTdxMisMatch
	Scope_Id and Interface Index do not agree.
	Action: On an IPv6 socket in a Common Inet configuration sendmsg() was issued with both a Scope_Id and an Interface Index specified but they each specify a different Cinet Transport Driver in their upper half words. Correct the program to use one or the other.
054B	JrShutDownInProgress
	Kernel shutdown is in progress on this system.
	Action: File systems can not be moved to a system that is being shutdown. Select a different system in the sysplex where the file system can be moved to and re-issue the move command.
054C	JrCDSFailure
	A failure was encountered while trying to access the CDS.
	Action: Contact your IBM service representative.
054D	JrCanNotBeOwner
	This system can not be a file system owner thru a move, newroot or recovery operation.
	Action: Unix System Services must be recycled to enable this system as a filesystem move target except if this message was issued from a newroot request. Reissue the newroot command after the move filesystem request has completed.
054E	JrInCompleteMove
	A file system was in the process of changing file owner when the target system (new owner) exited the sysplex during the move operation. The file system is being recovered.
	Action: Wait for partition cleanup to complete, then review the status of this file system ('F BPXOINIT,FILESYS=DISPLAY,FILESYSTEM=file system name'). If file owner needs to be changed, use the SETOMVS command to move ownership of the file system.
054F	JROutOfGvskCells
	The system is unable to obtain a cell from the GVSK cell pool.
	Action: See your IBM service representative.

Value	Description
0567	JrSymbFailed
	A symlink failed symbol resolution.
	Action: Internal service to resolve symbols failed.
0568	JROperUndefined
	The operation argument specified with the WRITE_DOWN function for BPX1ENV is undefined.
	Action: Specify a defined operation value for the WRITE_DOWN function of BPX1ENV and retry. See BPXYCONS for defined operation values.
0569	JRScopeUndefined
	The scope argument specified with the WRITE_DOWN function for BPX1ENV is undefined.
	Action: Specify a defined scope value for the WRITE_DOWN function of BPX1ENV and retry. See BPXYCONS for defined scope values.
056A	JRNeedTaskAcee
	WD_SCOPE_THD scope was specified with the WRITE_DOWN function for BPX1ENV but the calling task does not have a task level ACEE.
	Action: Specify WD_SCOPE_AS for the scope argument or create a task level ACEE and retry.
056B	JRPoeLenErr
	The length specified for the POE mapping is invalid.
	Action: Correct the POE length (see BPXYPOE mapping for defined length) and retry.
056C	JRPoeScopeErr
	The scope option specified in the POE mapping is incorrect either none or both scope options were specified.
	Action: Correct the POE scope option (see BPXYPOE mapping for defined scopes) so that one, and only one, is specified and retry.
056D	JRPoeEntryTypeErr
	The entry type specified in the POE mapping is invalid.
	Action: Correct the POE entry type (see BPXYPOE mapping for defined entry types) and retry.
056E	JRPoeEntryLenErr
	The entry type length specified in the POE mapping is invalid.
	Action: Correct the POE entry type length (see BPXYPOE mapping for defined entry type lengths) and retry.
056F	JRNotPoeAuthorized
	Thepoe function can not be performed because the caller is not permitted to the BPX.POE FACILITY class profile or is not a superuser.
	Action: Permit the caller process to the BPX.POE FACILITY class profile or make the caller a superuser (UID=0).

Value	Description
0570	JrSecurityConflict
	A mount request was rejected because the NOSECURITY option was specified when (1) the SECLABEL class was active, or (2) when a nonprivileged user requested the mount operation. The operation is not allowed.
	Action: Retry the mount operation without specifying the NOSECURITY option.
0571	JrNoSecLabel
	The operation was rejected because the object does not have a security label in an environment for which security labels are required.
	Action: Assign a security label to the object and retry the operation.
0572	JrTooManyHomeIfs
	A stack did not initialize because the Common Inet Sockets PreRouter could not obtain a buffer large enough to hold all of the home interface addresses.
	Action: Contact your IBM service representative.
0573	JrTooManyRoutes
	A stack did not initialize because the Common Inet Sockets PreRouter could not obtain a buffer large enough to hold all of the network routes.
	Action: Contact your IBM service representative.
0574	JrUmountFail
	A vfs_umount immediate failed on one or more clients in the sysplex during a remount attempt. The remount cannot proceed.
	Action: This may be due to an I/O error while attempting to save data.
0575	JrFIFOInFileSys
	Remount is not allowed when there are FIFOs in the filesystem. FIFOs must be closed prior to remount.
	Action: Close FIFOs and retry the remount.
0576	JrAggregateErr
	Remount is not allowed for a filesystem in an HFS-compatible aggregate if the clone is also mounted.
	Action: Unmount the clone and retry the remount.
0577	JrFileDesJustClosed
	A descriptor passed on this operation has just been closed by another thread.
	Action: This may be a serialization problem within the application. If this was a multi-descriptor operation it should be retried without that descriptor.
0578	JrSeclabelClassInactive
	A seclabel can only be set on a file when the SECLABEL class is active.
	Action: Activate the SECLABEL class according to the RACF specifications, and try the function again.

Value	Description
0579	JRNotSupportedForRemoteFile
	The requested service is not supported for a remote file such as a NFS mounted file.
	Action: Reissue the request, specifying a non-remote file for the request.
05C0	JRIarv64Serv
	An invocation of IARV64 service failed.
	Action: Retry the operation at a later time.
05C1	JRIarv64FCErr
	An invocation of IARV64FC service failed.
	Action: Retry the operation at a later time.
05C2	JRIsMountedRealName
	A mounted file system has a real or alias name that conflicts with this mount request.
	Action: This duplicate name situation occurs when either a z/OS UNIX file system was previously mounted using an alias data set name and the corresponding real data set name conflicts with the file system name specified by this mount request, or the file system name specified on this mount request is an alias data set name that has a real data set name that conflicts with the name of a previously mounted file system. Resolve the duplicate file system names and reissue the mount request.
05C3	JrSMCFcnCode
	The specified function code is not valid.
	Action: Reissue the BPX1SMC service with a correct function code value.
05C4	JrSMCFcnFlags
	The specified function flags are not valid.
	Action: Reissue the BPX1SMC service with a correct function flags value.
05C5	JrSMCWrongMutex
	The specified mutex is not associated with the specified condition variable.
	Action: Reissue the BPX1SMC service with a mutex that is properly associated with the specified condition variable.
05C6	JrSMCNotMutex
	The specified shared memory object is not a mutex object (SMMX).
	Action: Reissue the BPX1SMC service with a shared memory object that represents a mutex object (SMMX).
05C7	JrSMCNotCondvar
	The specified shared memory object is not a condition variable object (SMCV).
	Action: Reissue the BPX1SMC service with a shared memory object that represents a condition variable (SMCV).

Value	Description
05C8	JRSMCMutexLocked
	A destroy of a shared memory mutex cannot be done because the mutex is currently locked by another thread.
	Action: Destroy the mutex after insuring that the mutex is no longer in use.
05C9	JRSMCWaiters
	A destroy of a shared memory mutex or condition variable cannot be done because at least one other thread is waiting for the object.
	Action: Destroy the mutex or condition variable after insuring that it has no waiters.
05CA	JRSMCShrObjAddr
	The specified shared object area is not accessible to the caller.
	Action: Reissue the BPX1SMC service with a shared memory object that is accessible to the caller.
05CB	JRSMCEcbAddr
	The specified ecb is not accessible to the caller.
	Action: Reissue the BPX1SMC service with a ECB that is accessible to the caller.
05CC	JRSMCOutsideWait
	A wait function was attempted with the SMC_OutsideWait flag specified which is not an allowed combination.
	Action: Reissue the BPX1SMC service for the wait function without the SMC_OutsideWait flag specified.
05CD	JRSmcAlreadySetup
	A setup to wait function call was attempted from a thread that is already setup to wait.
	Action: Reissue the BPX1SMC service for the wait function after canceling the setup to wait from the prior BPX1SMC operation.
05CE	JRSmcShmAcc
	The caller does not have read/write access to the shared memory segment where the specified shared memory object resides.
	Action: Reissue the BPX1SMC service with a shared memory object that resides in a shared memory segment that the caller has read/write access to.
05CF	JRSmcNotShared
	The specified shared memory object is not in memory shareable by multiple address spaces.
	Action: Reissue the BPX1SMC service with a shared memory object that resides in a shared memory segment that the caller has read/write access to.
05D0	JRSMCNotOwner
	The calling thread does not own the mutex represented by the specified SMMX data area.
	Action: Change the application such that only the mutex owning thread attempts to unlock the mutex.

Value	Description
05D1	JRSMCMaxCntSys
	The maximum number of shared memory mutexes and/or condition variables are in use on the system.
	Action: Reissue the BPX1SMC service after insuring that another shared mutex or condition variable has been destroyed.
05D2	JRSMCUnusable
	The object is no longer usable do to an unexpected failure during an operation against the object.
	Action: Change the application such that only the mutex owning thread attempts to unlock the mutex.
05D3	JRSMCMutexSetup
	A setup to wait was done for a mutex with incorrect flag options specified.
	Action: A setup to wait for a mutex must only specify that an outside wait is requested. Any other request is not valid.
05D4	JRSMCNotSetup
	A cancel setup to wait was done but the caller is not currently setup to wait.
	Action: Change the application such that cancel setup to wait is done only after a setup to wait function.
05D5	JRSMCMemoryMap
	The specified Shared memory object is in memory mapped storage which is not supported.
	Action: Reissue the BPX1SMC service with a shared memory object that resides in a shared memory segment that the caller has read/write access to.
05D6	JRSMCMaxCntSeg
	The maximum number of shared memory mutexes and/or condition variables are in use for a single shared memory segment.
	Action: Reissue the BPX1SMC service after insuring that another shared mutex or condition variable has been destroyed from within the same shared memory segment.
05D7	JRSMCCondWaiters
	A destroy of a shared memory mutex cannot be done because at least one other thread is waiting for the associated condition variable.
	Action: Destroy the mutex after insuring there are no longer any waiters for the associated condition variable.
05D8	JRSigkillNotSent
	A SIGKILL signal must first be sent at least 3 seconds prior to the target process before attempting a superkill.
	Action: Send a SIGKILL to the target process.

Value	Description
05D9	JrNoGroups
	Can not target a group with a superkill.
	Action: Send the superkill to a specific PID.
05DA	JrUntargetable
	Can not target the address space with a superkill.
	Action: The process is no longer associated with a viable address space, no action is required.
05DB	JrNoDDorFileSystem
	Neither DDNAME nor FILESYSTEM was specified on a MOUNT statement in the processed parmlib member.
	Action: Edit the processed parmlib member in SYS1.PARMLIB and specify either a DDNAME or FILESYSTEM for each MOUNT statement.
05DC	JrNoOMVSseg
	User profile has no OMVS segment.
	Action: Provide an OMVS segment for the user's profile.
05DD	JrNoUserID
	No userid found.
	Action: No userID defined.
05DE	JrUserIDUnDeftoRACF
	UserID is not defined to RACF.
	Action: Define a userid for the user to RACF.
05DF	JrUserIDUnDeftoRACFIA
	User ID is not defined to RACF.
	Action: Define a userid for the user to RACF.
05E0	JrMoveBrlmFailure
	Active byte range locks failed to move during a file system move.
	Action: z/OS UNIX was unable move BRLM locks due to an internal error. It might be possible to move the file system to another system. A system dump may have been created.
05E1	JrAutoMoveable
	A filesystem mounted in a mode for which it is capable of being directly mounted to the PFS on all systems is considered automoveable.
	Action: An attempt to set the AUTOMOVE setting to NO or INCLUDE or EXCLUDE is rejected.
05E2	JrInvPFS
	The requested operation is not allowed for this PFS.
	Action: If this is a quiesce request and the PFS is ZFS, use ZFSADM QUIESCE.

Value	Description
05E3	JrTargetPidZombie
	The target pid specified is a zombie, AMODE information is not available for this process.
	Action: Specify a target pid that has not already exited.
05E4	JRSMCDisabled
	Use of a shared memory mutex has been disabled due to a cleanup problem with the application.
	Action: Change the application such that usage of all mutexes is complete prior to the cleanup of the shared memory they reside in or the ending of the application
05E5	JRSMCAlreadyInit
	Initialization of a shared condition variable or Mutex failed because storage already contains a shared condition variable or mutex.
	Action: Change the application such that it does not attempt to reinitialize the same storage with another shared condition variable or mutex.
05E6	JRShrConflict
	This open or remove type operation conflicts with a share reservation that has denied the access intended.
	Action: Wait awhile and try again or end the program that has the file open with a reservation.
05E7	JRAccessConflict
	The file is already open in a way that this open is trying to deny.
	Action: Wait awhile and try again or end the program that has the file open.
05E8	JRBlockingDeny
	A file may not be opened with Deny flags if O_NONBLOCK is off.
	Action: Change the program to set O_NONBLOCK on and to handle the open being rejected with EBUSY.
05E9	JROpenTokMax
	The maximum number of v_open tokens have been allocated for this process.
	Action: Close some of the open tokens with v_close.
05EA	JrNoShrsAtOwner
	Share reservations were requested on the open of a file but the file is owned by another sysplex member that is at a level which does not support share reservations so they cannot be enforced.
	Action: Move the file system to a sysplex member that is at a release level that is at least z/OS V1R7.

Value	Description
05EB	JrCantMoveShares
	A file system may not be moved to a sysplex member that does not support share reservations while there are active reservations on any file within that file system.
	Action: Move the file system to a sysplex member that is at a release level that is at least z/OS V1R7. Alternatively, stop the applications at the NFS clients who have put reservations on the files, or wait for them to be finished.
05EC	JrShrsLost
	The sysplex member that owned a file terminated and file system ownership has been taken over by a system that does not support the share reservations that had been established on this file so they can no longer be enforced.
	Action: Move the file system to a sysplex member that is at a release level that is at least z/OS V1R7 and then the file can be reopened as it was before. Note: The AUTOMOVE parameter of the MOUNT command can be used to restrict these takeovers to the systems that do support Share Reservations.
05ED	JrFileClosed
	The file has been closed.
	Action: Reopen the file or restart the program involved.
05EE	JRInvOpenTok
	The Open Token is not valid.
	Action: Ensure that the correct Open Token is supplied.
05EF	JRStaleOpenTok
	The Open Token has been closed.
	Action: Ensure that the correct Open Token is supplied.
05F0	JRInvAccess
	Access specified on a v_open must be read or write or both.
	Action: Specify a combination of ACC_READ and ACC_WRITE.
05F1	JRBadOpenType
	The VopnOpenType field on a v_open request has a value that is not supported.
	Action: Refer to BPXYVOPN for valid Open type values and reissue the request with a supported value.
05F2	JRCreateParmLen
	The length specified on a v_open request for a create parameter is not valid for the type of request.
	Action: Verify that a create parameter should be specified for the type of request being issued. If so, ensure it is of appropriate length for the parameter to be passed.
05F3	JRTokNotReg
	The VNODE token does not specify a regular file.
	Action: The service requested requires a regular file, but the VNODE token passed is not for a regular file. Correct the token and reissue the request.

Value	Description
05F4	JRUpgradeSet
	A v_open request for upgrading share options was specified with an access mode or deny mode which is less restrictive than the current setting.
	Action: A request to upgrade an existing open must specify an access mode or deny mode which has a greater value than the current settings. Correct the values in the VopnShrAccess and the VopnShrDeny fields and reissue the request.
05F5	JRDowngradeSet
	A v_open request for downgrading share options was specified with an access mode or deny mode which is more restrictive than the current setting.
	Action: A request to downgrade an existing open must specify an access mode or deny mode which has a lesser value than the current settings. Correct the values in the VopnShrAccess and the VopnShrDeny fields and reissue the request.
05F6	JRInvDeny
	A share deny specified on a v_open has a value that is not supported.
	Action: Refer to BPXYVOPN for valid Deny values and reissue the request with a supported value.
05F7	JRNotRegFile
	The operation requested can only be performed on a regular file.
	Action: Correct the pathname of the operation to that of a regular file and reissue the request.
05F8	JRWrtOverride
	An attempt was made to write to a file with the override of share reservations requested.
	Action: Overriding share reservations may only be done for reading from a file, not for writing.
05F9	JRBadTruncSize
	An attempt was made to open an existing file with v_open and truncate the file to a nonzero offset.
	Action: An existing file can only be truncated to zero when opening with v_open.
05FA	JRAttrNotSettable
	An attempt was made to open create a file with v_open but the requested attributes for the new file could not be set.
	Action: Ensure the appropriate privileges for the attributes specified.
05FB	JRICSFModNotFound
	ICSF random number generate module not found It is needed to open /dev/random and /dev/urandom.
	Action: Contact your system administrator to add the ICSF callable services library to the LINKLSTxx parmlib member and to check for availability of ICSF. Review the system log for message BPXF269I.'

Value	Description
05FC	JrICSFNotActive
	ICSF must be running to open/read from /dev/random or /dev/urandom or to generate/validate an IDT signature
	Action: Check the availability of ICSF with your system administrator.
05FD	JRICSFRACFfail
	RACF failed your request to use the CSNBRNG service of ICSF Permission is needed to open/read from /dev/random and /dev/urandom.
	Action: Contact your system administrator to get RACF permission to the CSFRNG profile in the CSFSERV security class.
05FE	JRICSFCardFail
	While attempting to open/read from /dev/random or /dev/urandom the PCI Cryptographic Coprocessor or PCI X Cryptographic Coprocessor failed.
	Action: Contact your system administrator.
05FF	JRICSFCardUnavailable
	Could not open/read from /dev/random or /dev/urandom because the specific PCI Cryptographic Coprocessor or PCI X Cryptographic Coprocessor requested for service is temporarily unavailable.
	Action: Contact your system administrator.
0600	JRICSFCardnotActive
	Could not open/read from /dev/random or /dev/urandom because the required PCI Cryptographic Coprocessor or PCI X Cryptographic Coprocessor was not active.
	Action: Contact your system administrator.
0601	JRICSFUnknownErr
	An unknown ICSF error occurred while trying to open/read from /dev/random or /dev/urandom or while trying to generate/validate an IDT signature.
	Action: Contact your system administrator. An OMVS CTRACE has been taken with the return codes.
0602	JrLockPurged
	A Byte Range Lock request has been canceled while it was waiting.
	Action: A waiting synchronous or a pending asynchronous lock request has been purged or canceled by a thread in the process, or the file has been closed. The lock request may be reissued if the file is still open.
0603	JrBRLMAbend
	An abend occurred in the Byte Range Lock Manager.
	Action: See your IBM service representative.
0604	JrTokMismatch
	The OpenToken passed does not belong to the VnodToken that was passed.
	Action: An OpenToken may only be used with the same VnodToken that was specified on the call to v_open that originally created the OpenToken. Insure that this rule is followed.

Value	Description
0605	JrNoVnTok
	An OpenToken was passed but not a VnodToken.
	Action: On v_lockctl both the OpenToken and the VnodToken are optional, but if an OpenToken is passed then the corresponding VnodToken must also be passed.
0606	JrAsyncBadAioToken
	The async I/O token passed on a cancel request is not valid.
	Action: When an asynchronous byte range lock request is scheduled a token is returned in the aiocb that must be used on any subsequent call to cancel the lock request. The original aiocb should not be modified until the asynchronous request completes or is canceled.
0607	JrOwnerMoved
	The filesystem is now owned by a different system.
	Action: The owner of the filesystem changed while this operation was in progress.
0608	JrOwnerNoSup
	No support for this operation by filesys owner.
	Action: The owner of the filesystem is not at the release level that supports this operation.
0609	JrClientNoSup
	The client is not at the release level that supports blocking when share reservations are enforced within the sysplex.
	Action: The file is opened by another program with share reservations. Wait until the program closes the file and retry the failed operation.
060A	JrBrlmOutOfStorage
	The Byte Range Lock Manager component has reported an out of storage condition.
	Action: There should be console messages or other indications of the storage shortage problems and when these are resolved the operation can be retried.
060B	JrNoMatchingFStype
	This error condition only applies to sysplex configurations This system could not mount a file system that was mounted by another system in the sysplex because there is no active Physical File System that matches the Physical File System TYPE that was specified on the original MOUNT request There are inconsistent FILESYSTYPE statements in the BPXPRMxx parmlib members All systems in the sysplex must specify the same FILESYSTYPE statements.
	Action: Verify that each system in the sysplex is configured with the Physical File Systems required by the mount hierarchy. The D OMVS,P system command can be issued on each system in the sysplex to identify the active Physical File Systems on each system. The D OMVS,F system command can also be issued on each system in the sysplex to identify the file systems mounted on each system. The output from these commands can then be compared across all systems in the sysplex to determine if any differences exist.

Value	Description
060C	JrShutdownFileOwner
	Automounted filesystems are not permitted after shutdown=fileowner has been issued on a system.
	Action: This filesystem can be mounted on a system that isn't in the shutdown=fileowner state.
060D	JrShrsInFileSys
	Remount is not allowed when there are NFS V4 share reservations on any file in the File System. Move is not allowed when a client system has NFS V4 share reservations on any file.
	Action: After the files are closed from the NFS clients the remount or move can be tried again.
060E	JRUnSupportedKey
	The caller of the service is running with a PSW Key that is not supported by the service.
	Action: Check the documentation for the service that is returning this error reason code to determine the supported Caller PSW Keys for the service.
060F	JRKeyMismatch
	The caller of the service is running with a PSW Key that does not match the key of the TCB that it is running on OR the PSW Key of the caller does not match the storage key of a storage area that it is trying to operate against.
	Action: For a BPX1MGT service call insure that both the PSW Key and TCB Key are the same. For a BPX1MAT service call insure that the PSW Key and the storage key of the specified shared memory segment are the same.
0610	JRProcessIsReSpawn
	The request to register as a permanent or blocking process cannot be performed because the current process is respawnable.
	Action: Determine if the process should be respawnable or permanent or blocking. If perm or blocking is desired, use the _BPXK_INITTAB_RESPAWN variable to set off the respawn attribute and issue the request again.
0612	JrShrsNotSupported
	The physical file system does not support share reservations.
	Action: Do not use share reservations (deny read or deny write) when accessing this file system.
0613	JRRecallFailure
	An attempt to retrieve an archived filesystem has failed.
	Action: Ensure that the DFHSM Facility is active.
0614	JRAutomountTerm
	The automount facility is terminating.
	Action: Restart the automount facility.

Value	Description
0615	JRNoOperlogActive
	The write to /dev/operlog cannot complete because Operlog is inactive.
	Action: Activate Operlog so that subsequent messages can be logged
0616	JROperlogRtFailed
	The write to /dev/operlog cannot complete because Operlog Routine has failed to queue messages to operlog.
	Action: Attempt the request at another time.
0617	JRNoDaemon
	The function could not complete. BPX.DAEMON facility class profile not defined.
	Action: To use define the BPX.DAEMON Facility class for your system.
0618	JRIpcRemovedAsy
	Between the start of an asynchronous I/O and the I/O completion the IPC message queue was removed and recreated.
	Action: Cancel all asynchronous I/O before removing the message queue that is being used.
0619	JrSecEnvrNotSet
	The SIOCSECENVR IOCTL with the SET argument was not issued by this server.
	Action: To use the SIOCSECENVR IOCTL with the GET argument, the server must first issue the SIOCSECENVR IOCTL with the SET argument.
061A	JrDuplicateGet
	The SIOCSECENVR IOCTL with the GET argument was already issued by this server.
	Action: There is no security object associated with this client. It was already retrieved by a previous SIOCSECENVR IOCTL with the GET argument.
061B	JrSECEnvrDeletedByRd
	The security object associated with this client has been deleted by a read syscall because the SIOCSECENVR IOCTL with the GET argument was not issued in a timely fashion.
	Action: There is no security object associated with this client. It was deleted by the system because a read syscall was issued before the SIOCSECENVR IOCTL with the GET argument. To avoid this from happening, the SIOCSECENVR GET should be issued immediately after the accept() syscall.
061C	JrSECENVRerror
	An error occurred while processing the security environment for this client so the security environment was deleted.
	Action: If the client's security environment is needed, close the client's socket and have the client reconnect to the server.

Value	Description
061D	JrNoSECENVRbuffer
	An error occurred while trying to obtain a buffer to hold the security environment.
	Action: There was insufficient storage available for the buffer in the user's address space. Report this problem to the system programmer so the cause of the problem can be determined and corrected
061E	JRFormatValueInvalid
	First Character of the input message must contain 0x80 for local messages or 0x00 for remote messages.
	Action: Enter the call again after changing the invalid parameter to a valid value.
061F	JRAutomountLkUp
	An error was encountered during pathname lookup because an automount managed file system could not be mounted.
	Action: Issue the MVS System Command, 'D OMVS,MF' on the system where the mount failure occurred. From the resulting display, locate the mount failure record for this mount request. Use the return code and reason code from this failure record to determine the exact cause for the mount failure.
0620	JRMountPtInProg
	Another file system is in the process of being mounted on the mount point specified.
	Action: Choose another mount point for the file system or unmount the mount in progress after it has finished
0621	JrOptionFlagsErr
	Caller specified a value in the option flags parameter of extended loadhfs that is not a supported value.
	Action: Undefined option flags must be zero, make sure to set unused option flags to zero
0622	JrLodDirectedSubpoolError
	Caller specified a subpool that is not supported on extended loadhfs call with Lod_Directed option flag.
	Action: Request a supported subpool on an extended loadhfs call with Lod_Directed option flag
0623	JrLodDirectedAuthErr
	Caller specified the Lod_Directed flag but is not authorized to do so.
	Action: Caller must be PSW Key 0-7 or supervisor state or APF authorized
0624	JrLodDirectedNoStorage
	Storage obtain request for the directed load failed.
	Action: There is insufficient storage available to load requested module into the requested subpool. If the problem persists, contact the system programmer to determine why there is a shortage of storage.

Value	Description
0625	JRPFSIsRecycling
	The Physical File System is recycling either on this system, or on the system that is the file system owner.
	Action: D OMVS,PFS command done from each system will display if the PFS is recycling. Wait for the recycle to complete and retry.
0626	JrActivityFound
	Activity found on the sysplex root file system.
	Action: During dynamic sysplex root file system migration, activities were found on the sysplex root file system. Look for message BPXF245I on each system.
0627	JrSecLabelMismatch
	During F OMVS, NEWROOT processing, the seclabel of the current and old roots do not match.
	Action: F OMVS, NEWROOT processing stops. The seclabels should match before the command is issued again.
0628	JrNewRoot
	The sysplex root file system has been changed.
	Action: Re-drive your suspended operations and new operations again.
0629	JrAlreadyDubbed
	The task is already dubbed.
	Action: No action is required
062A	JrAlreadyUnDubbed
	The task is already undubbed.
	Action: No action is required
062B	JrRemntMode
	The file system is already in the mode specified by remount.
	Action: Change the remount mode if needed.
062C	JrBadSameMode
	The file system is not in the mode specified by remount samemode.
	Action: Change the mode as necessary.
062D	JrAsyncANR
	The socket state is not valid to process an accept_and_recv operation.
	Action: Asyncio Accept_And_Recv operations cannot be processed on a socket that has processed an accept() operation.

062E	JrMountedUnowned
	Simodifiedoffowned
	The file system is mounted but unowned.
	Action: The file system has been mounted but not available because it is currently unowned. Issue D OMVS,F,N=filesys_name and F BPXOINIT,FILESYS=DISPLAY,FILESYSTEM= system commands to display the file system status.
	An unowned file system should be recovered automatically by the last owner system (specified by the RECOVERY OWNER in the F BPXOINIT, FILESYS=DISPLAY output) or possibly by other systems. Use the D OMVS, MF command on the RECOVERY OWNER system and other systems to determine why the file system could not be recovered automatically. Correct the failure if possible.
	To unmount the file system, use the F BPXOINIT,FILESYS=UNMOUNT,FILESYSTEM=filesys_name system command from any system.
062F	JrNoRemote
	The path specified requires crossing into a remote file system and that is not allowed.
	Action: Only specify files and directories that reside in file systems that are local to the server.
0631	JrRemoteRFI
	The file specified with Iocc#RegFileInt is in a file system that can be changed without notice.
	Action: Files that reside in a R/W sysplex aware zFS file system or that reside in an NFS Client file system can be changed on a remote system without this system knowing. For the zFS case, the file could be moved into an HFS file system or into a read-only zFS file system.
0632	JrFSTypeChanged
	The File System Type was changed due to generic type support for HFS and ZFS.
	Action: This mount could not be completed. The file system type was changed due to one of the following reasons:
	• The file system type specified was HFS and the file system was identified to be a ZFS.
	<ul> <li>The file system type specified was HFS and the file system type can not be identified so the file system type was changed to ZFS.</li> </ul>
	<ul> <li>The file system type specified was HFS and the file system is DFHSM migrated so the file system type was changed to ZFS.</li> </ul>
	• The file system type specified was ZFS and the file system was identified to be a HFS.
	When using 'D OMVS,MF' to view mount failures, entries of JRFsNotStart and JRFsTypeChanged for the same file system may be displayed when the file system is automount managed.
0633	JrPOEActionErr
	Thepoe() action options were specified incorrectly. POE#ReadPOE, POE#WritePOE and POE#SetGetPOE are mutually exclusive, more than one was specified.
	Action: Correct thepoe() action options and retry the operation.

Value	Description
0634	JrPOESocketScopeErr
	Thepoe() options were specified incorrectly. When POE#ScopeSocket is specified only POE#ReadPOE is allowed, POE#WritePOE, POE#SetGetPOE or no action option was specified.
	Action: Correct thepoe() action options and retry the operation.
0635	JrPOENotAvailable
	Thepoe() POE#ReadPOE action option was specified with scope options POE#ScopeProcess or POE#ScopeThread but the specified POE data was not initialized.
	Action: Correct thepoe() options or initialize the specified POE data an retry the operation.
0636	JrCannotDecrease
	The value specified is less than the current value.
	Action: SET OMVS or SETOMVS RESET cannot be used to decrease the current value of INADDRANYCOUNT for CINET. Specify a value greater than the current value.
0637	JrNoINETNwk
	A NETWORK statement for AF_INET6 cannot be processed unless there is also an AF_INET NETWORK statement with the same TYPE specified or already active.
	Action: Add an AF_INET NETWORK statement to parmlib or to the member specified on the SET OMVS or SETOMVS RESET command. AF_INET6 uses the INADDRANYPORT and INADDRANYCOUNT from the AF_INET NETWORK statement.
0638	JrInAddrAnyNotAllowed
	It is not permitted to pass an IP address of all zeros, InAddr_Any or In6Addr_Any, to this service.
	Action: Correct the sockaddr to pass a non-zero IP address.
0639	JrAmtNoFsName
	The automount file system name was blank because the directory did not match an existing specific entry and the generic entry did not specify a file system name.
	Action: Create a specific entry for the directory or add a file system name to the generic entry
063A	JrDubDuringExec
	An attempt was made to dub a subtask while an exec or spawn for the new job step was in progress.
	Action: Do not attempt to invoke z/OS UNIX System Services from another task while an exec or spawn is in progress for the job step task.
063B	JrNoSetUID
	NOSETUID was not specified on the nonprivileged user mount interface.
	Action: Specify the NOSETUID option instead or obtain authority to use SETUID.

Value	Description
063C	JrNonEmptyMntPtDir
	The mount point directory is not empty.
	Action: Retry the mount on an empty mount point directory.
063D	JrExceedMaxUsrMntSys
	The maximum number of nonprivileged user mounts for the system or sysplex has been exceeded.
	Action: Ask the system administrator to use the SET OMVS or SETOMVS command to dynamically increase the maximum number of nonprivileged user mounts. Then retry the nonprivileged user mount.
063E	JrExceedMaxUsrMntUsr
	The maximum number of nonprivileged user mounts for the user has been exceeded.
	Action: Retry the nonprivileged user mount after unmounting one of your mounted file systems.
063F	JrNotMntPtOwner
	The user does not own the mount point directory when the sticky bit is set.
	Action: Ask the system administrator to change the ownership of the mount point directory to you.
0640	JrNotRootOwner
	The user does not own the file system root when the sticky bit is set.
	Action: Ask the system administrator to change the ownership of the file system root to you.
0641	JrFileSystemMigrated
	The file system name specified on the nonprivileged user mount is HSM-migrated and automount facility is not running.
	Action: Recall the HSM-migrated file system or start automount facility then reissue the mount request.
0642	JrSysNameNotAllowed
	The system name specification is not supported on the nonprivileged user mount operation.
	Action: Retry the nonprivileged user mount without the sysname option.
0643	JrRemountNotAllowed
	Remount operation is not allowed for nonprivileged users.
	Action: Unmount the file system and then issue a mount request.
0644	JrUserUnMountNotAllowed
	The Nonprivileged user is not allowed to unmount a file system that was mounted by another user.
	Action: To unmount this file system, reissue the unmount request from a superuser or from the user who mounted this file system.

Value	Description
0645	JrPFSNotSupported
	The specified mount point is not in a supported file system for this mount request.
	Action: Reissue the request, specifying a mount point that is in a supported file system.
0646	JrNoRootAccess
	The nonprivileged user does not have read, write, and search permission to the specified file system root directory.
	Action: Ask the system administrator to give you read, write and search permissions for the file system root and reissue the mount or unmount request.
0647	JrNoMntPtAccess
	The nonprivileged user does not have read, write and search permission to the specified mount point directory.
	Action: Ask the system administrator to give you read, write and search permissions for the mount point directory. Then reissue the mount request.
0648	JrTooManyInProgress
	Too many nonprivileged user mounts are in progress at a given time.
	Action: Retry the operation. If the problem persists, contact the system administrator.
0649	JrMaxPipesUser
	The maximum number of pipes has been exceeded for this user.
	Action: The maximum number of pipes and FIFOs that the user can use is specified by the MAXPIPEUSER BPXPRMXX statement. Review the pipe and FIFO usage using the <b>zlsof</b> command.
064A	JrMaxPipes
	The system limit of 15,360 pipes and FIFOs has been reached.
	Action: Contact the system administrator to use the D OMVS,LIMITS system command to review the pipe and FIFO usage for the system, and D OMVS,PIPES to view the pipe and FIFO usage on a user basis.
064B	JrBadPET
	PET specified in ThliPET was invalid at the time BPX1STE/BPX4STE was invoked. Value must either be zero or a valid unauthorized PET.
	Action: Retry the operation with a valid value in ThliPET owned by the invoking thread.
064C	JrReleasedPET
	PET specified in ThliPET has already been released. No timer interrupt has been set for the invoking thread.
	Action: The invoking thread should either PAUSE on the PET specified in ThliPET or query the PET for release code.

Value	Description
064D	JrUniLseek
	This read/write operations fails because an Iseek was issued on this file with a prior read or write that caused conversion via Unicode Services with a CCSID that is not a single byte character set.
	Action: Once conversion has started, an Iseek that changes the file's cursor will cause a subsequent read or write to fail. An exception to this is an Iseek that sets the cursor to the beginning of the file (for all reads and for writes that do not cause partial characters to be saved). Any saved partial character is lost. When writing a partial character, a subsequent write must be issued to complete the character so that it can be converted and written to disk.
064E	JrUniPartialWrt
	A file being converted using Unicode Services on a write request, caused the file system to become full or reached the file size limit without writing all converted characters to the file. Writes of partial characters is not supported.
	Action: Free up space or increase the size of the file system
064F	JrUniOutOfStorage
	Unable to obtain storage for internal buffers used for converting files via Unicode Services.
	Action: Close files that are opened and being translated via Unicode Service to free up space.
0650	JrUniPartialChars
	A prior write operation on a file being converted using Unicode Services resulted in a partial character being saved but the following operation was a read.
	Action: The partial character is lost and never written to disk. When writing a partial character, a subsequent write must be issued to complete the character so that it can be converted and written to disk.
0651	JrUniCharSpec
	Character special files are not supported when files are being converted with Unicode Services.
	Action: Untag the file or do not open it when the program's CCSID is set.
0652	JrUniOpTooBig
	The read or write request trying to convert using Unicode Services specified a length that is too large.
	Action: Reissue the operation with a smaller length.
0653	JrUniPartialCharsShr
	The read or write request that was converting using Unicode Services, produced a partial character on a shared open at the same time that another thread was doing a read or write.
	Action: Threads that share opens and require Unicode Services conversion must coordinate their reads and writes to guarantee data integrity.

Value	Description
0654	JrUniMaxLenTooLong
	The maximum character length for one of the CCSIDs being used for conversion is too long.
	Action: Contact IBM support.
0655	JrUniMaxIoBufUser
	The Unicode I/O buffer storage allowed for this UID has exceeded the system specified amount.
	Action: Retry after some threads have ended, or change the maximum allowable limit via the MAXIOBUFUSER system parameter.
0656	JRCanceled
	The operation has been canceled.
	Action: BPX1AIO(Aio#Cancel) has been called to cancel an operation.
0657	JrUniCCSIDNotSupported
	The read or write request trying to convert using Unicode Services failed due to an unsupported CCSID.
	Action: Look in the z/OS Unicode Services User's Guide and Reference for a list of supported CCSIDs.
0658	JrCPLFcnReq
	Thecpl function code is inconsistent with the request type.
	Action: Correct thecpl function code to one that supports the specified request.
0659	JrCPLParmVer
	The input or output parameter version in the structure buffer passed tocpl is inconsistent with the request type.
	Action: Correct the input or output version and ensure that the necessary input parameters associated with the required input version are present.
065F	JrMaxThreads
	The system has reached the maximum number of threads allowed.
	Action: Try the request again after some threads have been exited and detached.
0660	JrSMFTypeSubtypeMismatch
	The SMF type or subtype parameters do not match the type or subtype specified in the SMF record to be written.
	Action: Change the SMF type and subtype parameters or the SMF type and subtype in the SMF record so that they match.
0661	JrSMFRecordLenMismatch
	The SMF record length parameters is smaller than the record length specified in the SMF record to be written.
	Action: Change the SMF record length parameter or the SMF record length in the SMF record so that they match.

Value	Description
0662	JROWTTerminated
	The service requested was offloaded to an Offload Worker Task that was already terminated.
	Action: Restart OMVS and try again.
0663	JrFailedBySyscallExit
	The callable service was disallowed by a pre-syscall exit routine. See the THLI control block for information regarding which exit routine rejected the syscall and the return and reason codes returned by the exit routine.
	Action: Examine the information in the THLI supplied by the failing exit routine. If possible, resolve the issue identified by the exit and retry the syscall if appropriate.
0664	JrSyscallExit
	The callable service attempted is not allowed to be called from a dynamic syscall exit routine.
	Action: See <i>z/OS UNIX System Services Programming: Assembler Callable Services Reference</i> for a list of callable services that cannot be called from a dynamic syscall exit routine.
0665	JJRMigNFSFile
	The file system specified for the migration contains open NFS files and that is not allowed.
	Action: Wait until all NFS files are closed and try the migration again.
0666	JRMigTargetMounted
	The target file system specified on the migration command is already mounted.
	Action: If the target file system name is correct, unmount the file system. Otherwise, specify the correct file system.
0667	JRMigTgtNotEmpty
	The target file system is not empty and this is not allowed.
	Action: Delete all files in the file system before starting the migration.
0668	JRMigNotLocal
	The source file system is not mounted locally.
	Action: Move the file system so that it is mounted locally or initiate the migration request from the owning system.
0669	JRMigNotStarted
	The specified source file system has not been designated for migration.
	Action: Initiate the migration before trying to change the migration settings.
0670	JRMigIsSwapping
	The specified source file system is in the process of being swapped.
	Action: Migration settings can no longer be changed for this file system.

Value	Description
0671	JrMigAlreadyInProgress
	Only one migration is allowed to be in progress.
	Action: Retry after the current migration is complete.
0672	JRMigIsCanceled
	Migration is being canceled for the specified source file system.
	Action: Restart the migration before trying to make changes to the migration settings.
0673	JRMigSrcNotHFS
	The specified source file system must be an HFS or zFS file system.
	Action: Retry the migration command with an HFS or zFS file system.
0674	JRInvMigCmd
	The specified migration subcommand is not valid.
	Action: Respecify the migration subcommand.
0675	JrSwapMissingTgtVnodPtr
	One or more source vodes do not have pointers to corresponding target vnodes during a migration swap attempt.
	Action: Determine the reason for the missing target vnode pointers.
0676	JrSwapDirInUse
	One or more directories are actively being read during a migration swap attempt.
	Action: Delay and retry the swap. Use <b>zlsof</b> to identify what jobs are using directories in the source file system.
0677	JRMigFsOptionsLen
	The FsOptions length specified for the modify migration is too long.
	Action: Verify why the FsOptions are too long and correct the error.
0678	JRMigBadRename
	The modify migrate request would cause the source file system name and the target file system name to be the same.
	Action: Change either the target name or source name and then retry the modify migration request.
0679	JRMigRenameTgtErrInt
	An internal error occurred. File system migration failed to rename the target file system.
	Action: Examine the LOGREC for the reason of the failure.
067A	JRMigCancelNotAllowed
	The specified file system migration is not allowed to be canceled at this time.
	Action: Retry the cancel command later.

Value	Description
067B	JrMigWriteAmt
	During a migration, a mirroring write failed to write enough bytes. The migration has been canceled.
	Action: Allocate a larger target zFS file system and retry the migration.
067C	JRMigNotActive
	The specified file system migration is not active.
	Action: Check the source file system name.
067D	JRMigSwapInProgress
	A migration cancel is not allowed when the swap is in progress.
	Action: If the swap isn't successful, try canceling the migration again.
067E	JRMigNoStorage
	There is not enough storage in the kernel address space.
	Action: This should be a transient condition. Reissue the service. If the problem persists, contact the system programmer or system administrator to diagnose the storage usage in the kernel address space.
067F	JRMigNotMirrored
	The source file system for migration must be mirrored before you can compare the contents.
	Action: Use the migration query function of BPXWMIGF to obtain the state of the migration.
0680	JRMigIsExported
	The file system specified for the migration is exported and that is not allowed.
	Action: Unexport the file system first and then try the migration command again.
0681	JRMigInProgressFs
	The specified file system has already been designated for migration.
	Action: If the file system name specified is correct, wait for the migration to finish. Otherwise, specify the correct file system name.
0682	JRMigDownLevel
	A system in the sysplex is at a release level that does not support file system migration. For HFS file system migration, z/OS release V2R3 and later is supported. For zFS file system migration, z/OS release V2R4 and later is supported. If the zFS file system being migrated was mounted RWSHARE, then the minimum LFS version is 2.04.13. APAR OA59891 must be installed on the system in order to be at LFS version 2.04.13.
	Action: Determine the LFS version of each member in the SYSBPX sysplex group by issuing the MODIFY BPXOINIT, FILESYS=DISPLAY, GLOBAL system command. After ensuring that each system is at the desired LFS version, retry the migration.
0683	JRSwapOWInProg
	One or more operations are actively in an osi wait during a migration swap attempt.
	Action: Wait for the operations to end and then retry the swap.

Value	Description
0684	JRRM64AM31
	The invoking task attempted to load an rmode64 program while running amode31.
	Action: To access the returned 64-bit address, the invoking task must run amode64 and use the BPX4LOD interface.
0685	JRRMODE64NOTSUPPORTED
	Service does not support rmode 64.
	Action: A parameter was passed for an executable address that was greater then a 31 bit address. Address must reside below the 2-gigabyte address range.
0686	JRMigRenameTgtErr
	File system migration failed to rename the target file system.
	Action: Examine the IDCAMS messages in the LOGREC for the reason of the failure.
0687	JRMigRenameTgtErr
	File system migration failed to rename the target file system.
	Action: Examine the IDCAMS messages in the LOGREC for the reason of the failure.
0688	JRMigNotAllowed
	Migration file system is not allowed to start.
	Action: An operation such as file system remount, unmount or move occurred recently that prevents file system migration for about 20 minutes. Try again later.
0695	JrNoUserCat
	zFS file system data set is not allowed to be cataloged in the master catalog.
	Action: Define an alias to the user catalog for the new zFS.
0696	JRIOCTLBackupClient
	The backup command for the ioctl cannot be issued from a file system client.
	Action: Issue the ioctl for more backup from a system that is not a file system client.
0697	JrMigMoveCancel
	The migration was canceled because you are trying to move or remount a file system that is in the progress of being migrated.
	Action: Wait until the migration has completed and then move or remount the file system.
069A	JrMvRemntInProgress
	The file system is either being moved to a different server or is being remounted.
	Action: Try again after the file system has been moved or remounted.
069B	JrMigEOMCancel
	During an active file system migration, an operation being mirrors to the target was unable to complete due to an EOM.
	Action: Restart the file system migration.

Value	Description
069E	JrPFSTerminating
	PFS is in process of terminating. Operation failed.
	Action: Retry operation once PFS is restarted.
069F	JrUFSNoMountParm
	A UFS did not specify the mount parameters.
	Action: Reissue the mount command with valid UFS mount parameters.
06A0	JrUFSMaxUpperDir
	A UFS mount specified more than one upperdir parameter.
	Action: Reissue the <b>mount</b> command with only one upperdir parameter.
06A1	JrUFSMissingDir
	A UFS mount must specify the upperdir, lowerdir, and workdir parameters.
	Action: Reissue the <b>mount</b> command and specify the upperdir, lowerdir, and workdir parameters.
06A2	JrUFSFidNotThere
	The file identifier specified on the vfs_get operation was not found.
	Action: Reissue the vfs_get call with a valid file identifier.
06A3	JrUFSNameNotFound
	The file or directory specified on the vn_lookup operation was not found.
	Action: Reissue the vn_lookup call with a valid file or directory name
06A4	JrUFSWhiteoutNode
	The vn_lookup operation returned a node with the whiteout bit on.
	Action: Reissue the vn_lookup call with a valid file or directory name.
06A5	JrUFSFileExists
	The requested name is already in use.
	Action: Reissue the vn_create call with a file name that does not already exist.
06A6	JrUFSMaxWorkDir
	A UFS mount specified more than one workdir parameter.
	Action: Reissue the <b>mount</b> command with at most one workdir parameter.
06A7	JrUFSUpperWorkDir
	A UFS mount specified upperdir and workdir parameters that do not reside on the same file system.
	Action: Reissue the mount command with the upperdir and workdir parameters that reside on the same file system.
06A8	JrUFSWorkDirNotEmpty
	A UFS mount specified a workdir directory that is not empty.
	Action: Reissue the mount command with an empty workdir parameter.

Value	Description
06A9	JRMmapAddrNot64Bi
	A request requires 64 bit MapAddress but the caller did not provide space for the 64-bit parameter.
	Action: Ensure that a 64-bit value is provided for the MapAddress when using above the bar storage.
06AA	JR3164BitMismatch
	A file map request is using a different storage parameter than has already been used for a given file.
	Action: When a file is mapped, all future maps to that file must be mapped using the same storage parameter.
06AB	JRMmapMaxShareFail
	A map request is attempted but the total share pages exceeds the MAXSHARE limit.
	Action: Ensure that mmap usage does not exceed MAXSHARE limits.
06AC	JrSMFMalformedExtHdr
	The record was not written because it contains a malformed record header for an extended record type. z/OS UNIX received return code 56 (38x) from the SMFEWTM macro.
	Action: For a complete description of the return codes, see <u>SMFEWTM - Writing SMF records</u> in <i>z/OS MVS System Management Facilities (SMF)</i> .
06AD	JrSMFExitModMalformedExtHdr
	The record was not written because it was modified by an installation-written exit to contain a malformed record header for an extended record. z/OS UNIX received return code 60 (3Cx) from the SMFEWTM macro.
	Action: For a complete description of the return codes, see <u>SMFEWTM - Writing SMF records</u> in <i>z/OS MVS System Management Facilities (SMF)</i> .
06AE	JrSMFExitSuppressedRec
	The record was not written because of an installation-written exit routine. z/OS UNIX received return code 20 (14x) from the SMFEWTM macro.
	Action: For a complete description of the return codes, see <u>SMFEWTM - Writing SMF records</u> in <i>z/OS MVS System Management Facilities (SMF)</i> .
06AF	JRCLNPNotValid
	An invalid CLNP parameter block was provided.
	Action: Ensure that the identifier, version, and length values provided in the CLNP parameter area are correct.
06B0	JRUnsupportedFlag
	One or more flags specified in the clone input parameter area is not supported.
	Action: Ensure that only flags supported by the clone, setns, or unshare syscalls are specified.

Value	Description
06B1	JRUnsupportedSignal
	The signal input to the clone syscall is not supported.
	Action: Ensure that only signals supported by the clone syscall are specified.
06B2	JRMutuallyExclFlag
	Mutually exclusive flags were specified in clone syscall parameter area.
	Action: Ensure that only valid combination of flags are specified on the clone syscall.
06B3	JrUFSSysplexNotSupported
	UFS mount points can only be accessed on the owning system.
	Action: Access the UFS mount point from the owning system.
06B9	JRMaxNamespace
	The maximum number of namespaces was exceeded.
	Action: Retry after some namespaces have ended.
06C0	JRNotEpollFD
	The provided file descriptor is not an epoll file descriptor.
	Action: Specify a file descriptor of an epoll file.
06C1	JREpollWatchSelf
	The provided epoll file descriptor and file descriptor to be monitored are the same.
	Action: Specify a different file descriptor.
06C2	JREpollCtlInvalidOp
	An option other than EPOLL_CTL_ADD, EPOLL_CTL_MOD, or EPOLL_CTL_DEL was specified for epoll_ctl.
	Action: Specify a valid option as described in BPXYEPOL.
06C3	JREpollCtlADDAlreadyRegistered
	The supplied file descriptor is already registered with epoll file.
	Action: Specify a unique file descriptor to be added or use the MOD option.
06C4	JREpollCtlMODNotRegistered
	The supplied file descriptor is not registered with this epoll file.
	Action: Specify a file descriptor that is being watched by this epoll file.
06C5	JREpollCtlDELNotRegistered
	The supplied file descriptor is not registered with this epoll instance.
	Action: Specify a file descriptor that is being watched by this epoll file.
06C6	JREpollCreateInvalidOp
	An invalid option was specified for epoll_create.
	Action: Specify option value 0 or 1.

Value	Description
06C7	JREpollCtlADDInvalidExclFile
	An Epoll file cannot be watched exclusively.
l	Action: Specify a valid event combination.
06C8	JREpollCtlInvalidExclEvent
	EPOLLPRI or EPOLLONESHOT cannot be specified with EPOLLEXCLUSIVE.
l	Action: Specify a valid event combination.
06C9	JREpollCtlInvalidEventArea
	The event area cannot be identified as valid. The eyecatcher value is incorrect.
	Action: The eyecatcher value must be as defined in BPXYEPOL@KMA.
06CA	JREpollCtlMODExclusive
	A file is either being modified to be or is already exclusively watched.
	Action: To change exclusivity the file must be deleted and re-added to the Epoll file.
06CB	JREpollCtlEvLen
	The value passed in the epoll event length parameter is invalid.
l	Action: Ensure the length matches macro BPXYEPOL.
06CC	JREpollMaxUserInstance
	The total number of file descriptors that a user can register across all epoll files on the system has been reached. The limit is per real user ID.
l	Action: Decrease the number of watched files, or increase the /proc setting.
06CD	JREpollCtlUnsupportedEvent
	An unsupported event was specified.
l	Action: Specify a supported event.
06CE	JREpollCtlNoEvents
	No events were specified.
	Action: Specify a valid event.
06CF	JrNamespaceNotFound
	The namespace specified on the request did not exist.
	Action: The request cannot be processed. Retry the operation specifying a valid namespace.
06D0	JrCalledFromInitProc
	The syscall or syscall option is not allowed from an init process.
	Action: Ensure that an init process only issues syscalls and options that are accepted in that environment.

Value	Description
06D1	JrMaxNamespaceNesting
	A new PID namespace was requested on a clone or unshare system call, but the namespace nesting depth limit would be exceeded.
	Action: The request cannot be processed. Retry the operation specifying a valid namespace.
06D2	JRNotAuthNameSp
	The caller is not authorized to create or manage namespaces.
	Action: If the BPX.NAMESPACE profile is defined in the FACILITY class, permit the caller to the profile. Otherwise make the caller a superuser.
06D6	JrNotContainerIDAuth
	The calling address space is not permitted to the CONTAINERS resource in the UNIXPRIV class and the caller is not a superuser.
	Action: Permit the caller to the CONTAINERS resource in the UNIXPRIV class or make the caller a superuser.
06D7	JrUFSTooManyMergedDirs
	Too many separate zFS file systems were specified for the UFS upperdir and lowerdir directories.
	Action: Review the directories specified on the upperdir and lowerdir mount parameters and ensure that they reside on no more than 32 distinct zFS file systems.
06D8	JrUFSDirNotUsable
	The file system of an upperdir or lowerdir directory was unmounted, causing operations on the UFS to be disabled.
	Action: Use the file system name to unmount the UFS.
06D9	JrUFSRemountUnsupported
	Remounts are not supported by UFS.
	Action: Unmount and mount UFS again if needed.
06DA	JrTdNotSet
	CINET Transport Driver Index (Td index) is zero during UTS/network namespace creation. Transport affinity is not set.
	Action: For information about establishing transport affinity, see Requesting transport affinity in z/OS UNIX System Services Planning.
06DC	JrMultiPidUnshares
	A process may call unshare with Clone_NewPid only once.
	Action: Recode the application to ensure that at most one unshare is performed per process.

Value	Description
06DD	JrNewPidNotAllowed
	A clone with Clone_NewPid request is not allowed when unshare or setns was run for the process.
	Action: Recode the application to ensure that clone with Clone_NewPid is not requested for a process where unshare or setns with Clone_NewPid has been performed.
06DE	JrSetnsMismatch
	The nstype specified on the setns call does not match the namespace type referred to by the file descriptor argument.
	Action: Change setns call so that the nstype specifies a single type that matches the namespace type referred to by the file descriptor or specify 0 to allow any type of namespace to be joined.
06DF	JrProcFSNameNotFound
	The file or directory specified on the vn_lookup operation was not found.
	Action: Reissue the vn_lookup call with a valid file or directory name.
06FA	JrAttxName
	Requested extended attribute name is null or name length set to zero.
	Action: Ensure requested attribute name and name length are properly set.
06FB	JrAttxUnavail
	Requested extended attribute is not set.
	Action: Ensure requested attribute is set before attempting to replace, remove, or retrieve an attribute.
06FC	JRInvAttxFTyp
	Filetype does not allow the setting of the specified extended attribute.
	Action: Ensure filetype supports set subcommand for extended attributes.
06FD	JRInvAttxCmd
	The request on extended attributes contains an invalid subcommand.
	Action: Ensure request for extended attributes contains a supported subcommand.
06FE	JRInvAttxValLen
	The request on extended attributes contains an invalid attribute length.
	Action: Ensure that the values provided in AttxValLn are correct.
06FF	JRAttxExists
	The setxattr request cannot set an extended attribute that is already set
	Action: To change the extended attribute value, use the replace subcommand.

Value	Description
06F0	JrSetnsFdNotNsLink
	The file descriptor specified on the setns call does not refer to a /proc/[pid]/ns/link.
	Action: Change the setns call so that the file descriptor represents a /proc/[pid]/ns link.
06F1	JrNotDescendentNs
	The target PID namespace on the setns call is not a descendant of the caller's PID namespace.
	Action: Change the setns call so that the file descriptor represents a descendant namespace.
06F2	JrUFSVgetCopyup
	The node specified in the copyup call was accessed via a v_get call and therefore has no name to copyup.
	Action: Access the node by name to initiate copyup.
06F3	JrNsInitProcTerm
	The init process in the target PID namespace has terminated.
	Action: Processes cannot be added to a PID namespace in which the init process has ended.
06F4	JrCSNotAvailable
	z/OS Communications Server is not available to provide UTS namespace services.
	Action: Retry the operation when z/OS Communications Server is available.
06F5	JrUFSExpNotSupported
	UFS does not support being exported using the BPX1VEX call.
	Action: Do not use a UFS file system on an export call.
06F6	JrNestedUFSNotSupported
	A UFS cannot be specified as the upper or lower directories.
	Action: Reissue the mount without directories on a UFS file system.
06F7	JrUFSStickyNotOwner
	The user does not own the file being unlinked when the sticky bit of the parent directory is on.
	Action: Ensure that the user owns the file being unlinked and reissue the command.
06F8	JrUFSDirsNotDifferent
	The directories specified in the mount options must all be different.
	Action: Specify different directories in the mount options.
06F9	JrUFSNFSNotSupported
	The upper and lower directories cannot be located on an NFS file system.
	Action: Ensure that the directories specified in the mount options are not in an NFS file system.

Value	Description
0700	JRSetAttxTrustClas
	The setxattr requests an invalid attribute in the trusted namespace.
	Action: Ensure extended attribute and namespace are valid.
0701	JRAttxNoSup
	The attribute for the setxattr/getxattr request is not supported by the file system.
	Action: Ensure attribute and file system are compatible.
0702	JRSetAttxNameSpc
	The setxattr request contains an invalid namespace.
	Action: Ensure namespace is supported.
0703	JrProcNoAccess
	The user did not have the appropriate permissions to access the proc file.
	Action: Reissue the request with the appropriate user.
0704	JrMntSrcPath
	A problem was found with the source directory specified.
	Action: Ensure the source directory exists.
0705	JRFSUnbindable
	A bind mount was attempted on mount point that was marked as unbindable.
	Action: Retry the bind mount on a different directory.
0706	JrMntSrcBuff
	A mount that requires a source directory was requested but the buffer is too small or not initialized correctly.
	Action: Ensure that the input MNTE is correct.
0707	JRMptRemount
	A mount was attempted with the MntEntFSModeRemount flag set and the path name specified could not be found.
	Action: Ensure the path name is an existing directory.
0708	JrUFSDirNotEmpty
	The directory trying to be removed is not empty.
	Action: Ensure that the directory specified in the remove is empty and try again.
0709	JRMptRemountRoot
	A mount was attempted with the MntEntFSModeRemount flag set and the path name specified was not an existing mount point.
	Action: Ensure the path name specified is an existing mount point.

Value	Description
070A	JRMptProp
	A mount was attempted with a mount propagation flag set and the path name specified could not be found.
	Action: Ensure the path name is an existing directory.
070B	JRMptPropRoot
	'A mount was attempted with a mount propagation flag set and the path name specified was not an existing mount point.
	Action: Ensure the path name specified is an existing mount point.
070E	JrUFSUsingFS
	The file system specified in the unmount is being used by a UFS.
	Action: Unmount the UFS prior to unmounting the specified file system.
070F	JrCPLPListError
	The parameter list supplied tocpl specifies an inappropriate or unsupported request attribute.
	Action: The error is one of the following:
	<ul> <li>For function code CPL_IXLMG, the request does not specify CHAINTYPE=OFFSET.</li> </ul>
	Correct the input specification and resubmit the request.
0711	JROFlagNotSupported
	Unsupported flag in OH_OFLAGS.
	Action: Change the openat2 call to only specify supported bits in OH_OFLAGS.
0712	JROModeNotSupported
	Unsupported flag in OH_OMODE.
	Action: Change the openat2 call to only specify supported bits in OH_OMODE.
0713	JRPathNotCached
	Not all path components have been present in kernel cache.
	Action: Reset resolve_cached or reissue openat2 after execute other syscall that resolves the same path.
0714	JRLookupAcrossMpt
	Lookup tried to cross file system mount point.
	Action: Reset resolve_no_xdev or reissue openat2, specifying the pathname that is within the same file system as the dirfd.
0715	JRMagicLink
	Pathname has magic link.
	Action: Reset resolve_no_magiclinks or reissue openat2 specifying the pathname that does not have magic links.

Value	Description
0716	JRBeneath
	Lookup tried to reach the pathname that is not descendant of dirfd.
	Action: Reset resolve_beneath or reissue openat2 specifying the pathname that is a descendant of dirfd.
0717	JrOpenHowSize
	The provided size of OpenHow is too small .
	Action: Change the openat / openat2 call so that enough bytes are provided for the OpenHow struct.
0718	JrAtNotDirFD
	The dirfd parameter on openat/openat2 does not refer to a directory .
	Action: Specify the file descriptor of an open director or the special value AT_FDCWD for DirFD.
0719	JRBeneathAbsPath
	Lookup tried to reach the pathname that is an absolute path.
	Action: Reset resolve_beneath or reissue openat2 specifying a relative pathname.
071A	JRBeneathAbsSym
	Lookup tried to reach the pathname that is an absolute symbolic path.
	Action: Reset resolve_beneath or reissue openat2 specifying a relative symbolic path.
071B	JRBeneathDotDot
	Lookup tried to reach the pathname that starts with dot-dot.
	Action: Reset resolve_beneath or reissue openat2 specifying a pathname that does not start with dot-dot.
071C	JRPathCacheNotSupported
	Physical file system does not support lookup cache.
	Action: Reset resolve_cached or reissue openat2 after enable lookup cache in the physical filesystem.
071D	JRTooLongNotCached
	A path component is longer than 20 characters. It is not present in kernel cache.
	Action: Reset resolve_cached or reissue openat2 specifying a pathname that each component is not longer than 20 characters.
071E	JRSymLinkNotAllowed
	Pathname has symbolic link.
	Action: Reset resolve_no_symlinks or reissue openat2 specifying the pathname that does not have symbolic links.

Value	Description
071F	JRMagicLinkNotAllowed
	Pathname has magic link.
	Action: Reset resolve_beneath and resolved_in_root or reissue openat2 specifying the pathname that does not have magic links.
0720	JRResolveNotSupported
	Unsupported flag in resolve field.
	Action: Change the openat2 call to only specify supported resolve flags.
0721	JRInvMinArgLenAttx
	The input length of the ioctl subcommand must be at least the size of the extended attribute structure.
	Action: Ensure the input length value for the ioctl command is sufficient.
0722	JRInvArgLenAttx
	The input length of the ioctl subcommand is insufficient to hold the extended attribute structure and its returned data.
	Action: Ensure the input length value for the ioctl command is sufficient for both the extended attribute structure and its returned data.
0723	JrNsInitProcNoHandler
	The target process is the initial process of a PID namespace and it has not defined a signal handler for the specified signal.
	Action: Only signals that have a handler defined can be sent to the initial process of a PID namespace.
0724	JrProcNoSuchProcess
	The process associated with the proc file or directory does not exist.
	Action: The action cannot be performed with the specified file.
0725	JrProcMagicLinkDenied
	The current process does not have the authority to resolve the link.
	Action: Ensure that the current process has the same effective UID and GID as the process associated with the proc file and the process associated with the proc file is dumpable.
0726	JrProcNoSuchDescriptor
	The file descriptor associated with the link is not opened by the associated process.
	Action: The action cannot be performed with the specified file.
0727	JrProcNoSuchNamespace
	The requested namespace no longer exists.
	Action: The action cannot be performed with the specified file.

Value	Description
0729	JrProcNotPermitted
	Operation is not permitted on the proc file system.
	Action: Do not perform the action on the file or directory in the proc file system.
0730	JrProcCannotCreate
	The file or directory cannot be created in the proc file system.
	Action: Do not perform the action on the file or directory in the proc file system.
0731	JrNsInitProcNoHandler
	The attribute value in AttxVal is invalid.
	Action: Ensure the value for AttxVal is supported for the type of extended attribute.
0739	JRMoveSrcMpt
	The source path specified on a mount point move request was not a mount point.
	Action: Ensure that the source path specified on the move mount point call is a mount point.
073A	JrNotPermittedtoPid
	Process is not permitted to operate on the specified process ID (PID).
	Action: Reissue the request specifying a PID that the caller is authorized to operate on, or reissue the request from a superuser ID.
073B	JrFileIsBound
	The path specified is the location of a bind mount.
	Action: Unbind the file and reissue the command.
073D	JrProcNotFSProgram
	Process is a zombie or not otherwise associated with a program in the file system.
	Action: Check the status of the process for which the command was issued.
073F	JrProcNotInNamespace
	No directory exists for the current process since the process does not exist in the namespace associated with the proc mount.
	Action: The directory cannot be opened on the specified proc mount.
0740	JRMtNsDownLevel
	A system in the sysplex is at a release level that does not fully support mount namespaces. In order to support mount namespaces, the minimum LFS version required is 2.4.14 for z/OS release V2R4 and 2.5.14 for z/OS release V2R5. Install APAR OA63850 for z/OS V2R4 and APAR OA62734 for z/OS V2R5.
	Action: Issue F BPXOINIT, FILESYS = DISPLAY, GLOBAL system command to determine the LFS version of each member in the SYSBPX sysplex group. After ensuring that each system is at the desired LFS version, retry the function.
0741	JrPidNsMaxProc
	The maximum number of processes in a PID namespace was exceeded.
	Action: Retry after some processes have ended.

Value	Description
0746	JRMtNsLocal
	Mounting to another system is only allowed in the initial mount namespace.
	Action: Issue mount in the initial mount namespace or specify the local system as the mount destination.
0748	JrFilesystemCovered
	The file system requested to be unmounted is covered by another mounted file system.
	Action: Unmount any covering file systems and reissue the <b>unmount</b> command.
0749	JrFSNameProhibited
	A file system name may only be specified when mounting from the initial mount namespace.
	Action: Reissue the mount command without specifying a file system name.
074C	JrUFSMergedSecurity
	The upper or lower directories are on file systems with incompatible security specifications.
	Action: If you are mounting with the NoSecurity option, ensure that the upper directory is on a file system that was mounted with the NoSecurity option. If you are mounting without the NoSetUID option, ensure that all merged directories are on file systems that were mounted without the NoSetUID option.
074D	JrFsInUseNS
	A normal unmount was requested for the file system. The file system is being used in at least one mount namespace, so the request to unmount cannot be honored.
	Action: A normal unmount was requested for the file system but the request to unmount cannot be honored because the file system is being used in at least one mount namespace.
074E	JrNsNotAllowed
	The requested operation is not allowed in this namespace.
	Action: Retry the operation in the initial mount namespace.
074F	JrNsInitialNotAllowed
	The requested operation is not allowed in the initial mount namespace.
	Action: Reissue the operation in a new mount namespace.
0750	JrXAttrNoTrusted
	Only setxattr can be used to modify extended attributes in the trusted namespace. You cannot use lsetxattr or fsetxattr.
	Action: If you want to modify a trusted.* extended attribute, use the setxattr function.

Value	Description
0755	JrAuthBadMsgBuffSubpool
	The specified RACROUTE message buffer subpool is outside of the acceptable range of 0 to 127.
	Action: Issue a new call toauthenticate specifying a subpool number in the acceptable range.
0756	JrAuthIdtInvalid
	authenticate() call made with an invalid identity token
	Action: Issue a new call toauthenticate(), specifying a valid identity token.
0757	JrAuthUserIdtMismatch
	IDT user does not match the specified user name.
	Action: Issue a new call toauthenticate(), specifying a matching IDT and user, or specify only an IDT or a user.
0758	JrAuthCredTypeInvalid
	authenticate() call made with undefined or unspecified credential type parameter.
	Action: Issue a new call toauthenticate(), specifying a valid credential type parameter.
0759	JrIncompatOptnFlags
	Incompatible bits were set in the option flags parameter.
	Action: Reissue the call to the service without the incompatible bits set. This error may be returned for the following reasons:
	<ul> <li>AUTH_RETURN_USERNAME# option flag was specified on a call toauthenticate() when authenticating with a user name.</li> </ul>
	<ul> <li>AUTH_BUILD_IDT# option flag was specified on a call toauthenticate() when authenticating with an identity token.</li> </ul>
075A	JrIDTUnsigned
	IDTs used for authentication or returned to an end-user must be signed.
	Action: One of the following errors was encountered when processing an identity token:
	• An application attempted to authenticate an end-user with an unsigned identity token
	<ul> <li>An application attempted to generate an identity token but the security services are not configured to generate signed identity tokens.</li> </ul>
	Contact your security administrator to update the necessary configurations to allow the use of signed identity tokens
075B	JrIDTApplMismatch
	IDT audience claim does not match the specified application name.
	Action: Reissue the call to the service specifying an application that is authorized to use the identity token.

Value	Description
075C	JrNoIDTGenerated
	The security server did not generate an identity token.
	Action: Contact your security administrator to ensure that the IDTDATA class is active and RACLISTed.
075D	JrCntrMntNoNsInitial
	The mount being attempted is not allowed in the initial namespace under the CONTAINERS resources in the UNIXPRIV class.
	Action: The file system must be a UFS. Also, covering the root cannot be done from the initial namespace. Verify that the mount is permitted by the CONTAINERS resource in the UNIXPRIV class.
0766	JrUserNotAuthAppl
	The user is not authorized to use the specified application.
	Action: Reissue the request specifying an application to which the user has been authorized.
0800	JrSecurityContextSizeErr
	The size of the caller's security context object  caused spawn to flag it as an error.
	Action: Verify the caller's security product definitions. If more information is needed, contact your IBM service representative.
0801	JrProcNoWrite
	Writing is not allowed for the specified proc file.
	Action: Avoid writing to the specified proc file.
0802	JrUFSNoRedirect
	Rename of a directory contained within the lower directory of a Union File System is not allowed without the redirect_dir option turned on.
	Action: Remount the UFS with the redirect_dir option turned on and try the rename operation again.
0803	JrQuiesceNewNs
	A file system cannot be quiesced if it was first mounted in a new namespace.
	Action: None.
0804	JrQuiesceBind
	A bind mount file system cannot be quiesced.
	Action: None.
0805	JRSubMntPathTooLong
	The path name of a sub-mount for recursive bind mount is longer than PATH_MAX (1023).
	Action: Reduce the length of the recursive bind mount path and reissue the request.

Value	Description
7101	JrSipcOPEN
	SNAckets IPC Open error occurred.
	Action: See your IBM service representative.
7102	JrSipcCONNECT
	SNAckets IPC Connect error occurred.
	Action: See your IBM service representative.
7103	JrSipcCLOSE
	SNAckets IPC Close error occurred.
	Action: See your IBM service representative.
7200	JRAckLenFailure
	The size of the TPI data is not large enough to support the Prim_type field.
	Action: Unrecoverable error. Contact the systems programmer.
7201	JRUnExpectedAck
	The Prim_type received from the TPI request does not match the request.
	Action: Unrecoverable error. Contact the systems programmer.
7202	JRAlreadyBound
	The Socket has already been bound by a previous request.
	Action: This protocol does not support multiple binds to the same socket.
7203	JRNotBound
	Read not allowed on unbound socket unless it is RAW.
	Action: Bind the socket and retry the request.
7204	JRWrongBand
	Message received on wrong band.
	Action: Unrecoverable error. Contact the systems programmer.
7205	JRTLIerror
	ERRNO returned by the transport layer interface.
	Action: See ERRNO.
7206	JRConnFail
	Previous connection request on this socket failed.
	Action: Check previous connection request to determine why it failed.
7207	JRCFGMREQLenErr
	The size of the returned buffer is not large enough to support a CFGMREQ structure.
	Action: Unrecoverable error. Contact the systems programmer.

Value	Description
7208	JRBulkModeErr
	The type of socket request specified is not valid for a Bulkmode socket.
	Action: Specify a valid socket request for the Bulkmode socket.
7209	JrIOCTLAccessAuthorization
	The user does not have access authority for the requested ioctl.
	Action: APF, OE Superuser or RACF authorization is required for SET ioctls.
720A	JRIOCTLSizeIncorrect
	The size of the structure used in the ioctl is not correct.
	Action: Verify that the structure passed to the ioctl is correct.
720B	JRIOCTLAFNotSupported
	The address family is not supported for the specified ioctl.
	Action: Verify the socket address passed on the local is correct.
720C	JRIOCTLRTTableSize
	The TCP/IP Route table does not fit in the buffer provided.
	Action: Iocn_RtMsgHdrType.Iocn_RtMsgHdrNumEnt specifies the number of entries in the route table.
720D	JRIOCTLTPrimNotSet
	No primary interface is defined to TCP/IP.
	Action: Use the Home statement to define an interface to TCP/IP.
720E	JRIOCTLLinkName
	The ifr_name specified was not found to be a valid, defined link name.
	Action: Verify the ifr_name specified. Ensure that a LINK statement defined this name to TCP/IP.
720F	JRDevNumInvalid
	The device number specified is not valid for the operation.
	Action: Verify that the device number specified is correct.
7210	JRIPAddrInvalid
	The IP address specified is not valid for the operation.
	Action: Verify that the IP address specified is correct.
7211	JRLinkNameInvalid
	The link name specified is not valid for the operation.
	Action: Verify that the link name specified is correct.
7212	JRInterfaceInvalid
	The interface specified is not valid for the operation.
	Action: Verify that the interface specified is correct.

Value	Description
7213	JRDeviceCTCInvalid
	The device conflicts with a CTC device.
	Action: Verify that the device number specified is correct.
7214	JRDeviceCLAWInvalid
	The device conflicts with a CLAW device.
	Action: Verify that the device number specified is correct.
7215	JRDeviceLCSInvalid
	The device conflicts with a LCS device.
	Action: Verify that the device number specified is correct.
7216	JRLinksMaxExceeded
	The number of link names has been exceeded.
	Action: Verify that the link is correct.
7217	JRInterfaceAlreadyStopped
	The Interface is already stopped.
	Action: Verify that the device number specified is correct.
7218	JRInterfaceAlreadyStarted
	The interface is already started.
	Action: Verify that the device number specified is correct.
7219	JRDeviceNotDefined
	The device number specified is not defined.
	Action: Verify that the device number specified is correct.
721A	JRDeviceAlreadyDefined
	The device is already defined.
	Action: An attempt was made to create duplicate devices.
721B	JRDeviceUnsupported
	The device type is unsupported.
	Action: An attempt was made to create an unsupported device type.
721C	JRDeviceActive
	The device type is active.
	Action: An attempt was made to delete an active device.

Value	Description
721D	JRConfigErr
	Config statement is in error.
	Action: One of the following errors was encountered when processing a config statement:
	<ul> <li>The config statement is outside of its Beg/End statements.</li> </ul>
	<ul> <li>An attempt was made to delete an interface via the INTERFACE statement but the interface is in use as a SOURCEVIPAINTERFACE.</li> </ul>
	<ul> <li>An attempt was made to define an interface via the DEVICE and LINK statements but inconsistent types were specified.</li> </ul>
	<ul> <li>An INTERFACE statement was specified to define an interface with multiple-VLAN support but the statement parameters violated the multiple-VLAN rules.</li> </ul>
	Correct the config statement and restart the function.
721E	JRAFNotSupported
	Address Family is not supported.
	Action: Verify that the address family was properly specified in the SockAddr structure.
721F	JRTCPNotUp
	TCP/IP is not initialized.
	Action: Start TCP/IP Initialization.
7220	JRUDPNotUp
	TCP/IP is not initialized.
	Action: Start TCP/IP Initialization.
7221	JRGetConnErr
	The connection was not in the proper state for retrieving.
	Action: Try the request later.
7222	JRPATFNDErr
	Search for a restricted port failed.
	Action: Verify the restricted port table.
7223	JRPATFNXErr
	Search for restricted ports failed.
	Action: Verify the restricted port table.
7224	JRPATADDErr
	Add new restricted port failed.
	Action: Verify the restricted port table.
7225	JRPATDELErr
	Delete a restricted port failed.
	Action: Verify the restricted port table.

Value	Description
7226	JRPATExistErr
	Restricted port entry already existed.
	Action: Verify the key of the added entry.
7227	JRPATNotFound
	Restricted port entry is not found.
	Action: Verify the key of the deleted entry.
7228	JRInvaliddAddr
	Specified address is not valid.
	Action: Verify the destination address in the SockAddr structure.
7229	JRPortRErr
	The input specified in the port range statement is not valid.
	Action: Verify that the port range was properly specified in the Add Port Range statement.
722A	JRInterfaceDefinedByHome
	The interface has been used within a Home statement.
	Action: Remove the Interface from the Home list.
722B	JRDeviceDefinedByLink
	The device is defined by a Link statement.
	Action: Remove the Link statement that uses the device.
722C	JRDeviceTypeInvalid
	The device type is not valid for the operation requested.
	Action: Verify that the device type of the device is correct.
722D	JRBSDRoutingParmsNeverUsed
	BSDRoutingParms were never configured for TCP/IP.
	Action: Add BsdRoutingParms to TCP/IP Configuration.
722E	JRBINDOutState
	The current TPL state is not unbound when doing a bind request.
	Action: Validate the specified port number and IP address in the bind request.
722F	JRBINDBadSockAddr
	Bad Socket Address data present in the source IP address.
	Action: Validate the IP address in the bind request.
7230	JRBINDAddrNActive
	Local address was not active when processing the bind request.
	Action: Validate the specified IP address in the bind request.

Value	Description
7231	JRBINDNoPort
	No port is available. Port entries have reached the maximum number.
	Action: TCP/IP is running out of connection IDs. Wait and retry the bind request later.
7232	JRBINDAddrInUsed
	The INADDR_ANY is being used by other users. The bind request fails.
	Action: Try the bind request later.
7233	JRUNBINDNotIDLE
	The requested connection was not in the proper state for the request.
	Action: Try the unbind request later.
7234	JROPTLERR
	The value specified for option_length is not valid.
	Action: Reissue the request with a valid value.
7235	JRSendLimit
	The send buffer size is not valid. It is too big.
	Action: Validate the option management send buffer request.
7236	JRRcvdLimit
	The received buffer size is not valid. It is too big.
	Action: Validate the option management receive buffer request.
7237	JRBSTOpt
	The value specified for option_value is not valid.
	Action: Reissue the request with a valid value.
7238	JRBRTOpt
	The value specified for option_value is not valid.
	Action: Reissue the request with a valid value.
7239	JRIPOpt
	The value specified for option_value is not valid.
	Action: Reissue the request with a valid value.
723A	JRTOSOpt
	The value specified for type of service is not valid.
	Action: Reissue the request with a valid value.
723B	JRTTLOpt
	The value specified for time to live is not valid.
	Action: Reissue the request with a valid value.

Value	Description
723C	JRIPOPTLERR
	The value specified for option_length is not valid.
	Action: Reissue the request with a valid value.
723D	JRTOSOPTLERR
	The value specified for option_length is not valid.
	Action: Reissue the request with a valid value.
723E	JRTTLOPTLERR
	The value specified for option_length is not valid.
	Action: Reissue the request with a valid value.
723F	JRConnNotIdle
	Connect request not in idle state.
	Action: Connect should only be issued after bind request.
7240	JRBroadcastDest
	Cannot connect to a broadcast address.
	Action: Specify a valid address.
7241	JRConnectToSelf
	Connect address is the same as the source address.
	Action: Specify a valid address.
7242	JRConnTCBNotFound
	A TCB was not found for the specified socket.
	Action: Use a valid socket descriptor.
7243	JRBadTCBEye
	The TCB has been freed or overlaid.
	Action: Refer to provided diagnostic information to resolve the problem. Contact service for assistance.
7244	JRNoAcceptTCB
	There is no valid TCB on the accept queue.
	Action: Refer to provided diagnostic information to resolve the problem. Contact service for assistance.
7245	JRDisconTCBNotFound
	The TCB could not be found for disconnect.
	Action: Refer to provided diagnostic information to resolve the problem. Contact service for assistance.
7246	JRPortAccessAuth
	User does not have authority to access this port.
	Action: Specify a valid port.

Value	Description
7247	JRPortBusy
	Specified port is in use.
	Action: Specify a port not in use or try again later.
7248	JRSENDOPTLERR
	The value specified for option_length is not valid.
	Action: Reissue the request with a valid value.
7249	JRRECVOPTLERR
	The value specified for option_length is not valid.
	Action: Reissue the request with a valid value.
724A	JRBSTOPTLERR
	The value specified for option_length is not valid.
	Action: Reissue the request with a valid value.
724B	JRBRTOPTLERR
	The value specified for option_length is not valid.
	Action: Reissue the request with a valid value.
724C	JRRtInvalidTOS
	Specified route type of service is not valid.
	Action: Specify a valid route type of service.
724D	JRRtInvalidGateWayAddr
	Specified route gateway address is not valid.
	Action: Specify a valid route gateway address.
724E	JRRtInvalidProtocol
	Specified route protocol is not valid.
	Action: Specify a valid route protocol address.
724F	JRRtInvalidType
	Specified route type is not valid.
	Action: Specify a valid route type address.
7250	JRRtInvalidDest
	Specified route destination is not valid.
	Action: Specify a valid route type address.
7251	JRRtInvalidMask
	Specified route subnet mask is not valid.
	Action: Specify a valid subnet mask.

Value	Description
7252	JRRtInvalidHostAddr
	Specified route host ip address is not valid.
	Action: Specify a valid host ip address.
7253	JRHardwareTypeNotSupported
	Specified hardware type is not supported.
	Action: Specify a supported hardware type.
7254	JRLinkTypeInvalid
	The link type is not valid for the operation requested.
	Action: Verify that the link type of the device is correct.
7255	JRNoHomeStatement
	The link name does not have an associated home statement.
	Action: Verify that the link name specified has a home statement.
7256	JRIOCTLNotSupported
	The specified ioctl is not supported in this version of TCP/IP.
	Action: Unrecoverable error. The ioctl type does not exist.
7257	JRLVLSOCNOSUP
	The option_name that was specified is not supported.
	Action: Reissue the request with a valid option_name.
7258	JRLVLTCPNOSUP
	The level that was specified is not supported.
	Action: Reissue the request with a valid level.
7259	JRLVLIPNOSUP
	The option_name that was specified is not supported.
	Action: Reissue the request with a valid option_name.
725A	JRInvOptLen
	The option length is not valid.
	Action: Validate the option length.
725B	JRInvOptVal
	The option value is not valid.
	Action: Validate the option value.
725C	JRConnAlreadyExists
	The address is already in use.
	Action: Specify an address that is not in use.

Value	Description
725D	JRStartNonDeviceInvalid
	An attempt was made to start an interface which is not a device.
	Action: Specify a device on the START command.
725E	JRBadIOCTLToIF
	An internal error occurred between the ioctl and Interface layer.
	Action: Contact your IBM service representative.
725F	JRLinkNotDefined
	The link name specified is not defined.
	Action: Verify that the link name specified is correct.
7260	JRMaxStartsExceeded
	An internal limit of START DEVICEs has been exceeded.
	Action: Contact your IBM service representative.
7261	JRDeviceHasLinks
	An attempt was made to DELETE a device, but the device has at least one LINK defined to it.
	Action: Delete the link(s) and then delete the device.
7262	JRDeviceHasNOLinks An attempt was made to START a device, but the device has no LINKs defined to it.
	Action: Define a link to the device.
7263	JRInterfaceNotDefined
	The interface specified is not defined.
	Action: Define the interface.
7264	JRRtAlreadyExists
	The route already exists.
	Action: Delete the route and retry.
7265	JRRtNotDefined
	The route is not defined.
	Action: Route to be deleted is not defined.
7266	JRRtRemoveDirectError
	The route to be removed is a direct route.
	Action: Correct the route type information.
7267	JRGateWayUnreachable
	The gateway is unreachable by any routes.
	Action: Add a route to the gateway and retry.

Value	Description
7268	JRRtRemoveIndirectError
	The route to be removed is an indirect route.
	Action: Correct the route type information.
7269	JRArpsvMult
	Multiple ATMARP servers are defined for the same link.
	Action: Correct the ATMARPSV statement to specify only one ATMARP server for the link.
726A	JRDeviceMPCPTPInvalid
	A MPCPTP link was defined for an incorrect device type.
	Action: Correct the link statement to point to a MPCPTP device.
726B	JRDeviceHCHInvalid
	An HCH link was defined for an incorrect device type.
	Action: Correct the link statement to point to an HCH device.
726C	JRDeviceCDLCInvalid
	A CDLC link was defined for an incorrect device type.
	Action: Correct the link statement to point to a CDLC device.
726D	JRDeviceX25Invalid
	An X.25 link was defined for an incorrect device type.
	Action: Correct the link statement to point to an X.25 device.
726E	JRDeviceATMInvalid
	An ATM link was defined for an incorrect device type.
	Action: Correct the link statement to point to an ATM device.
726F	JRLinkAlreadyDefined
	The link is already defined.
	Action: Correct the profile to remove the duplicate link definition.
7270	JRPvcAlreadyDefined
	The PVC is already defined.
	Action: Correct the profile to remove the duplicate PVC definition.
7271	JRPvcNotDefined
	The PVC name specified is not defined.
	Action: Verify that the PVC name specified is correct.
7272	JRLisNotDefined
	The LIS name specified is not defined.
	Action: Verify that the LIS name specified is correct.

Description
JRArpsvNotDefined
The ATMARPSV name specified is not defined.
Action: Verify that the ATMARPSV name specified is correct.
JRLisInUseForDevice
Another LINK for this device already specifies this LIS.
Action: Correct the LIS name on the LINK statement.
JRPvcLinkNotATM
An ATMPVC was defined for an incorrect link type.
Action: Correct the ATMPVC statement to point to an ATM link.
JRLisInconsistent
The LIS name is already defined with a different subnet value/mask.
Action: Correct the ATMLIS statement to define the same subnet value and subnet mask.
JRLisOptionsUpdated
An ATMLIS redefinition caused the LIS options to be updated.
Action: None required if this was the intended result.
JRPvcInUseAsArpsv
An attempt was made to delete an ATMPVC which is in use as an ATMARP server.
Action: Stop the ATM device which is using this PVC as an ATMARP server.
JRLinkHasPvcs
An attempt was made to DELETE a LINK, but the LINK has at least one ATMPVC defined to it.
Action: Delete the link(s) and then delete the ATMLIS.
JRLisHasLinks
An attempt was made to DELETE an ATMLIS, but the ATMLIS has at least one LINK defined to it.
Action: Delete the link(s) and then delete the ATMLIS.
JRLisHasArpsvs
An attempt was made to DELETE an ATMLIS, but the ATMLIS has at least one ATMARPSV defined to it.
Action: Delete the ATMARPSV(s) and then delete the ATMLIS.
JRArpsvInUse
An attempt was made to DELETE an ATMARPSV, but at at least one ATM device is using the ATMARPSV.
Action: Stop the device(s) currently using the ATMARP server and then delete the ATMARPSV.

Value	Description
727D	JRNotInLis
	The IP address of a defined ATMARPSV is not in the specified LIS.
	Action: Correct the ATMARPSV statement to specify a consistent LIS name and IP address.
727E	JRTELSTATERR
	Attempt to update the telnet attributes when the connection is not yet established.
	Action: Verify the socket address of the telnet entry or try it later.
727F	JRTELNFNDERR
	Telnet session is not found.
	Action: Verify the socket address of the requested telnet entry.
7280	JRArpsvAlreadyDefined
	The ATMARPSV is already defined.
	Action: Correct the profile to remove the duplicate ATMARPSV definition.
7281	JRLisMismatch
	The LIS name on the ATMARPSV PVC statement does not match the LIS defined on the link to which the specified PVC is defined.
	Action: Correct the profile to specify the correct LIS name.
7282	JRDeviceSNAInvalid
	A SNA link was defined for an incorrect device type.
	Action: Correct the link statement to point to a SNA device.
7283	JRLinkHasNoPvcOrLis
	An ATM link was defined but did not specify a LIS and has no PVCs defined to it.
	Action: Correct the link statement to specify a LIS or define an ATMPVC for the link.
7284	JRRtInvalidMaskHost
	A host route with a non-zero mask was received.
	Action: Update the subnet mask to be zero or the route flag to be non-zero and rerun the command.
7285	JRRtInvalidMaskDefault
	A non-default route was received with a destination of 0.
	Action: Update the destination address or the default route flag and rerun the command.
7286	JRRtNoBsdRoutingParmsSet
	A route was added for a link without BSDRoutingParms.
	Action: Use VARY TCPIP,OBEYFILE to set BSDRoutingParms for the link used by the route.

Value	Description
7287	JrRtInvalidMaskCidr
	The mask does not conform to CIDR requirement.
	Action: The mask field must have contiguous one bits until the first zero bit. No ones are allowed after the first zero.
7288	JrMsgInvalidFlag
	The socket does not support the function that was specified with the flags parameter.
	Action: Reissue the request with a valid function.
7289	JrVariableSubnettingNotAllowed
	IPCONFIG did not specify RIPV2 or length of rtentry is wrong.
	Action: Correct IPCONFIG statement with VARSubnetting or the length of the rtentry. There is a new length for Variable Subnetting (RIPV2).
728A	JRsysplexAddrNotFound
	The sysplex loopback address 127.0.0.128 could not be resolved to the sysplex domain name by the gethostbyaddr() syscall.
	Action: Verify the DNS configuration. Ensure that the TCP/IP stack points to an active DNS in the same sysplex and that the DNS has the PTR record for the 128 host defined in the 0.0.127.in-addr.arpa. zone.
728B	JRresNotFoundInDNS
	The specified group or server+group name could not be found within the sysplex domain.
	Action: Determine whether the requested resource exists within the cluster domain in the sysplex DNS. If the resource does not exist within the DNS data base, then start or re-register the specified resource.
728C	JRgroupNameRequired
	A server name was specified in the sysplexFqDnData structure without a group name.
	Action: Specify a group name in the sysplexFQDnData structure.
728D	JRinvalidBufTokn
	An incorrect CSM buffer token was provided.
	Action: The communication storage manager detected that the CSM buffer token being used on the socket call has previously been freed. The application could optionally take a FFST dump to record key application-specific data areas. The application can reissue the socket call using a different CSM buffer.
728E	JRMCTTLOpt
	The value specified for multicast time to live is not valid.
	Action: Reissue the request with a valid value.
728F	JRMCTTLOptLErr
	The value specified for option length is not valid.
	Action: Reissue the request with a valid value.

Value	Description
7290	JRMCLoopOpt
	The value specified for multicast loopback is not valid.
	Action: Reissue the request with a valid value.
7291	JRMCLoopOptLErr
	The value specified for option length is not valid.
	Action: Reissue the request with a valid value.
7292	JRMCIFOpt
	The value specified for multicast interface is not valid.
	Action: Reissue the request with a valid value.
7293	JRMCIFOptLErr
	The value specified for option length is not valid.
	Action: Reissue the request with a valid value.
7294	JRMCAddMemOpt
	The value specified for multicast add membership is not valid.
	Action: Reissue the request with a valid value.
7295	JRMCAddMemOptLErr
	The value specified for option length is not valid.
	Action: Reissue the request with a valid value.
7296	JRMCDropMemOpt
	The value specified for multicast drop membership is not valid.
	Action: Reissue the request with a valid value.
7297	JRMCDropMemOptLErr
	The value specified for option length is not valid.
	Action: Reissue the request with a valid value.
7298	JRMCMaxMem
	The maximum number of groups per socket has been exceeded.
	Action: Change the program to not join more than 20 groups.
7299	JRIESizeMismatchAdd
	Request area was not large enough on add/remove.
	Action: See your IBM service representative.
729A	JRIESizeMismatchGet
	Request area was not large enough on get.
	Action: See your IBM service representative.

Value	Description
729B	JRIESizeMismatchGetTable
	Request area was not large enough on Get Table.
	Action: See your IBM service representative.
729C	JRIESizeMismatchSetTable
	Request area was not large enough on Set Table.
	Action: See your IBM service representative.
729D	JRIEOutCntInvalid
	cOutCnt is zero or less than the cInCnt.
	Action: See your IBM service representative.
729E	JRIEInCntInvalid
	cInCnt is zero.
	Action: See your IBM service representative.
729F	JRIEGetTableFlags
	Flags set on a GetTable.
	Action: See your IBM service representative.
72A0	JRIEGetFlags
	Flags set on a Get.
	Action: See your IBM service representative.
72A1	JRIESetTableFlags
	Flags set on a SetTable.
	Action: See your IBM service representative.
72A2	JRIESetFlags
	Flags set on a Set.
	Action: See your IBM service representative.
72A3	JRIEGetTableUnexpected
	Unexpected error on GetTable.
	Action: See your IBM service representative.
72A4	JRIEGetUnexpected
	Unexpected error on Get.
	Action: See your IBM service representative.
72A5	JRIESetTableUnexpected
	Unexpected error on SetTable.
	Action: See your IBM service representative.

Value	Description
72A6	JRIESetUnexpected
	Unexpected error on Set.
	Action: See your IBM service representative.
72A7	JRIERecoveryError
	Unexpected error on Recovery.
	Action: See your IBM service representative.
72A8	JRIEProfileError
	Unexpected error during profile processing.
	Action: See your IBM service representative.
72A9	JRIEAddifcioctltype
	Attempt to add an ifcioctl with ifhtype not iflifc.
	Action: See your IBM service representative.
72AA	JRIEUnknownifcioctlType
	Unknown ifcioctl Type attempted.
	Action: See your IBM service representative.
72AB	JRTcpTcpipError
	Refer to TSRB return and reason codes.
	Action: See your IBM service representative.
72AC	JRTcpInvalidTcpipName
	Invalid Tsrb_Tcpip_Name.
	Action: See your IBM service representative.
72AD	JRTcpInvalidRequestCode
	Invalid Tsrb_Request_Code.
	Action: See your IBM service representative.
72AE	JRTcpNotInstalledOrUp
	TCPIP not installed or active.
	Action: See your IBM service representative.
72AF	JRTcpInvDelete
	The delete requestor did not create the connection.
	Action: See your IBM service representative.
72B0	JRTcpInvUserData
	Request contained invalid user data.
	Action: See your IBM service representative.

Value	Description
72B1	JRSKCIBInvalidMessage
	Invalid IOCTL message type.
	Action: See your IBM service representative.
72B2	JRSKCIBAlreadySleeping1
	Recursive context sleep.
	Action: See your IBM service representative.
72B3	JRSKDKINotReadQueue
	Invalid queue for find open/close.
	Action: See your IBM service representative.
72B4	JRSKDKINotWriteQueue
	Invalid queue for find poll/iocport.
	Action: See your IBM service representative.
72B5	JRSKDKIBadFindType
	Invalid type for find.
	Action: See your IBM service representative.
72B6	JRSKDKINotFound
	No such device/module for find.
	Action: See your IBM service representative.
72B7	JRSKDKIBadQGetType
	Invalid type for queue get info.
	Action: See your IBM service representative.
72B8	JRSKDKIBadQSetType
	Invalid type for queue set info.
	Action: See your IBM service representative.
72B9	JRSKHEDBadOpen
	Open of stream head driver not allowed.
	Action: See your IBM service representative.
72BA	JRSKMNTBadMessage
	Invalid message type.
	Action: See your IBM service representative.
72BB	JRSKMNTSnooperAlreadyActive
	Snooper module previously pushed.
	Action: See your IBM service representative.

Value	Description
72BC	JRSKMNTSnooperNotActive
	Snooper module not previously pushed.
	Action: See your IBM service representative.
72BD	JRSKSTOBadIndex
	Invalid starting index for STREAMOP.
	Action: See your IBM service representative.
72BE	JRSKSTOBadStream
	Invalid stream address for STREAMOP.
	Action: See your IBM service representative.
72BF	JRSKSTOBadMessageType
	Invalid message type for read.
	Action: See your IBM service representative.
72C0	JRSKSTONoEmptyMessages
	Zero message length invalid for write.
	Action: See your IBM service representative.
72C1	JRSKSTOMessageTooShort
	Message length too short for write.
	Action: See your IBM service representative.
72C2	JRSKSTONoControlPart1
	No control part for putpmsg.
	Action: See your IBM service representative.
72C3	JRSKSTOBadMessageLength1
	Invalid message length for putpmsg.
	Action: See your IBM service representative.
72C4	JRSKSTOBadMessageLength2
	Invalid message length for lputpmsg.
	Action: See your IBM service representative.
72C5	JRSKSTOBadControlInformation
	Invalid control information for fdinsert.
	Action: See your IBM service representative.
72C6	JRSKSTONoMessages
	No queued messages for getband.
	Action: See your IBM service representative.

Value	Description
72C7	JRSKSTOResourceShortage2
	Unable to get triple for M_READ message.
	Action: See your IBM service representative.
72C8	JRSKSTOResourceShortage3
	Unable to get triple for M_IOCTL message.
	Action: See your IBM service representative.
72C9	JRSKVRBBadOption1
	Invalid option for open.
	Action: See your IBM service representative.
72CA	JRSKVRBNotUp
	System not initialized.
	Action: See your IBM service representative.
72CB	JRSKVRBBadName
	Invalid name for push.
	Action: See your IBM service representative.
72CC	JRSKVRBNoResources1
	Unable to allocate queues for push.
	Action: See your IBM service representative.
72CD	JRSKVRBNothingPushed1
	No pushed module exists for pop.
	Action: See your IBM service representative.
72CE	JRSKVRBNotMultiplexed
	Driver not multiplexed for link.
	Action: See your IBM service representative.
72CF	JRSKVRBNotLinked
	No linked driver/module for unlink.
	Action: See your IBM service representative.
72D0	JRSKVRBBadType
	Invalid type for flush.
	Action: See your IBM service representative.
72D1	JRSKVRBNoResources2
	Unable to get triple for M_FLUSH message.
	Action: See your IBM service representative.

Value	Description
72D2	JRSKVRBBadMask
	Invalid signal mask for setsig.
	Action: See your IBM service representative.
72D3	JRSKVRBBadAction
	Invalid action for setsig.
	Action: See your IBM service representative.
72D4	JRSKVRBBadID
	Invalid identifier for spgrp.
	Action: See your IBM service representative.
72D5	JRSKVRBBadFlag
	Invalid flag for spgrp.
	Action: See your IBM service representative.
72D6	JRSKVRBNoErrno
	No error number for spgrp.
	Action: See your IBM service representative.
72D7	JRSKVRBBadOption2
	Invalid behavior option for srdopt.
	Action: See your IBM service representative.
72D8	JRSKVRBBadOption3
	Invalid message option for srdopt.
	Action: See your IBM service representative.
72D9	JRSKVRBBadOption4
	Invalid length option for swropt.
	Action: See your IBM service representative.
72DA	JRSKVRBBadClass1
	Invalid IOCTL class for str.
	Action: See your IBM service representative.
72DB	JRSKVRBBadClass2
	Invalid IOCTL class for transport.
	Action: See your IBM service representative.
72DC	JRSKVRBNoResources3
	Unable to get triple for M_IOCTL message.
	Action: See your IBM service representative.

Value	Description
72DD	JRSKVRBNothingPushed2
	No module pushed for look.
	Action: See your IBM service representative.
72DE	JRSKASMBadType
	Invalid type for ?SKASM(*RANGE).
	Action: See your IBM service representative.
72DF	JRSKSACNoStream
	Invalid stream @ for ?SKSAC(*ACCESS).
	Action: See your IBM service representative.
72E0	JRSKSACLinkedStream
	Invalid stream for ?SKSAC(*ACCESS).
	Action: See your IBM service representative.
72E1	JRMultipleRead
	A request to receive data is already outstanding.).
	Action: Reissue the socket call after the outstanding call has completed.
72E2	JRDeviceMPCHLCSInvalid
	A MPC HPDT/LCS link was defined for an incorrect device type.
	Action: Correct the link statement to point to a MPC HPDT/LCS device.
72E3	JRCmConfigured
	Cache Manager has been configured for this server socket.
	Action: Verify the specified socket descriptor and reissue the socket call.
72E4	JRCmNoLog
	Cache Manager Configuration parameter does not include the size of the log file.
	Action: Verify the log size value in the Cache Manager Configured request.
72E5	JRCmNoCache
	Cache Manager Configuration parameter does not include the size of the cache file.
	Action: Verify the cache size value in the Cache Manager Configured request.
72E6	JRCmServerNotFound
	Cache Manager has not been configured for this server socket.
	Action: Run Cache Manager configuration IOCTL and reissue this IOCTL.
72E7	JRCmCantLoad
	Invalid Dynamic Exit load module name specified in the Config IOCTL parameters.
	Action: Verify the load module name and reissue the socket call.

Value	Description
72E8	JRCmNoStorage
	Cache Manager encountered storage shortage.
	Action: See your IBM service representative.
72E9	JRCmNoCSm
	Cache Manager encountered a CSM storage shortage.
	Action: See your IBM service representative.
72EA	JRCmNotConfigured
	Cache Manager has not been configured for this server socket.
	Action: Verify the specified socket descriptor and reissue the socket call.
72EB	JRNotCmAuthorized
	User is not allowed to use Cache Manager function.
	Action: See your IBM service representative.
72EC	JRCmParmNotValid
	Invalid parameters used in Cache Manager IOCTL call.
	Action: Verify the specified parameters and reissue the socket call.
72ED	JRCmLoadModBad
	Invalid Dynamic Exit load module name specified in the Config IOCTL parameters.
	Action: Verify the load module name and reissue the socket call.
72EE	JRUWCONotFound
	Cache Manager has not been configured for this server socket.
	Action: Verify the specified socket descriptor and reissue the socket call.
72EF	JRUWCOStorageFailed
	Cache Manager encountered storage shortage.
	Action: See your IBM service representative.
72F0	JRUWCTStorageFailed
	Cache Manager encountered storage shortage.
	Action: See your IBM service representative.
72F1	JRUWHTStorageFailed
	Cache Manager encountered storage shortage.
	Action: See your IBM service representative.
72F2	JRUWCTFull
	Cache Manager table has been filled.
	Action: Reconfigure the Cache Manager for this server socket or reissue the socket call later.

Value	Description
72F3	JRCmNoObjects
	Maximum number of objects has been reached.
	Action: Reconfigure the Cache Manager for this server socket or reissue the socket call later.
72F4	JRCmDisable
	Cache Manager is not allowed for this TCP/IP stack.
	Action: See your IBM service representative.
72F5	JRCmLSocKBadState
	Cache Manager Server is not in the LISTEN state.
	Action: Try the request later.
72F6	JRCmDestroyFailure
	Cache Manager Storage cannot be removed.
	Action: See your IBM service representative.
72F7	JRCmBadConfigData
	Cache Manager cannot call the DGW exits.
	Action: See your IBM service representative.
72F8	JRCmCacheObjLimit
	Cache Manager maximum number of objects has been reached.
	Action: Delete unused objects and retry the request later.
72F9	JRCmCacheSpaceLimit
	Cache Manager Buffer is filled.
	Action: Delete unused objects and retry the request later.
72FA	JRCmCacheObjNotFound
	Cache Manager Object is not found.
	Action: See your IBM service representative.
72FB	JRDynAddCxFailure
	Cannot add new connection to Dynamic exits.
	Action: See your IBM service representative.
72FC	JRDynDelCxFailure
	Cannot delete a connection from Dynamic exits.
	Action: See your IBM service representative.
72FD	JRDynTimerFailure
	Cannot start the timer from Dynamic exits.
	Action: See your IBM service representative.

Value	Description
72FE	JRDynRecoveryFailure
	Cannot start the recovery from Dynamic exits.
	Action: See your IBM service representative.
72FF	JrCmIOVPNotValid
	Invalid IOV buffer passed in the load request.
	Action: Validate the IOV buffer and retry the request.
7300	JrCmLogFull
	LogBuffer is Full.
	Action: Increase Maximum Log Buffer Size and retry the request.
7301	JRCmsgDataInvalid
	cmsghdr data has an incorrect value.
	Action: Supply valid cmsghdr data.
7302	JrDVIPAAlreadyActive
	The Dynamic VIPA activated via IOCTL was already active.
	Action: Ensure the correct IP address was selected. No action is required if the IP address was correct.
7303	JrDVIPANotInVIPARange
	The Dynamic VIPA was not in any defined VIPARange.
	Action: Ensure the correct IP address was selected, or configure the receiving TCP/IP with an appropriate VIPARange containing the desired Dynamic VIPA.
7304	JrDVIPAConflictDVIPA
	The Dynamic VIPA selected is already defined via VIPADEFine or VIPABackup.
	Action: Select another IP address and try again.
7305	JrDVIPAConflictIPAddr
	The Dynamic VIPA selected is already active as a standard IP address.
	Action: Select another IP address and try again.
7306	JrTooManyDVIPAs
	The maximum allowed number of DVIPAs is already defined.
	Action: Delete one or more DVIPAs from the stack and try again.
7307	JrDVIPANotDefined
	The Dynamic VIPA selected for deletion was not defined here.
	Action: Ensure the correct IP address was selected. No action is required if the IP address was correct.

Value	Description
7308	JrNoDuAvailable
	TCP/IP cannot create a dispatchable unit to process the request. Either TCP/IP is not active or there is insufficient common storage available.
	Action: Check if TCP/IP is active. If it is inactive, start the TCP/IP procedure. If TCP/IP is already active, the system is probably experiencing a common storage shortage. Retry the request. If the failure persists, contact the system programmer to diagnosis a common storage shortage.
7309	JRPortUnavailable
	The requested port is marked reserved and is not available to any application.
	Action: The requested port has been marked RESERVED with the PORT or PORTRANGE TCP/IP Configuration statement. If access is required, the configuration must be changed to remove RESERVED.
730A	JRAFOpNotSupported
	The operation is not supported for a socket in this address family.
	Action: Change the application to not perform this operation on a socket in this address family
730B	JRCannotMapSockAddr
	The socket address provided by the application on this call cannot be mapped to an IPv4 socket address.
	Action: Provide different user input or change the application so that the socket address specified by the application can be mapped to an IPv4 socket address.
730C	JRNetAccessDenied
	The user is not permitted to communicate with the specified network.
	Action: If access to the specified network is required, the user must be permitted to the appropriate SAF resource
730D	JRNotAuthStack
	Userid is not authorized to access the TCP/IP Stack.
	Action: Userid must be given read permission to resource EZB.STACKACCESS.sysname.tcpipname to access the stack successfully. sysname is the MVS system image name and tcpname is the TCP/IP jobname
730E	JRNotAuthPort
	Userid is not authorized to access the reserved TCP/IP Port.
	Action: Userid must be given read permission to resource EZB.STACKACCESS.sysname.tcpipname.safname. safname is defined on the TCP/IP PORT or PORTRANGE statement. sysname is the MVS system image name and tcpname is the TCP/IP jobname.
730F	JRFRCAReset
	FRCA connection timer expired. Connection is being dropped.
	Action: If the persistent timeout value is being set too low. The System Administrator can change the setting in the HTTPD.CONF file.

Value	Description
7310	JrNoCsaStorage
	TCP/IP cannot process the request because there is insufficient common storage available.
	Action: The system is probably experiencing a common storage shortage. Retry the request. If the failure persists, contact the system programmer to diagnosis a common storage shortage.
7311	JRZeroPortDVIPA
	A port of zero was specified on a bind when the IP address was a distributed DVIPA and the local stack is a target stack.
	Action: Specify a non-zero port on the bind().
7312	JRTCPIPAlreadyInitialized
	TCPIP has already initialized.
	Action: The vfs_network call for AF_INET6 was rejected because TCPIP has already initialized. TCPIP will have to be recycled to process the AF_INET6 network statement.
7313	JrIPv6NotEnabled
	TCP/IP cannot process the IPv6 request because the TCP/IP stack is not currently IPv6 enabled.
	Action: If IPv6 support is desired then the TCP/IP stack must be defined to UNIX System Services as being enabled for IPv6 support before the stack is started. See the IP Configuration Guide for information on how to define the stack as IPv6 enabled.
7314	JRInvalidValue
	The value specified is not a valid value.
	Action: An invalid value was detected by one of the following functions:
	<ul> <li>setsockopt() or sendmsg() function calls</li> </ul>
	The option value specified on setsockopt() or the value specified in the cmsg_data field of the ancillary data on sendmsg() is not valid. Ensure the value is within the allowable range of values. Re-issue the socket call with a valid value.
	An input value is incorrect. Correct the value and invoke the request again.
7315	JRInvalidOptLength
	The option length specified is not valid.
	Action: The value specified for the option length is not valid. Re-issue the socket call with a valid option length.
7316	JRDefaultExceeded
	The value specified exceeds the system default.
	Action: One of the following has occurred for a setsockopt() or sendmsg() issued by a non-authorized application: - The IPV6_UNICAST_HOPS socket option was specified with an option value that exceeds the system defined default for hop limit The value specified on the IPv6_HOPLIMIT ancillary data object, for a unicast packet, exceeds the system defined default for hop limit. The application should issue a getsockopt() to determine the system default. The application can then re-issue the socket call with a value that is less than the system defined default.

Value	Description
7317	JROptNotSupported
	The option specified is not supported on this type of socket.
	Action: Check the type of socket that was created and ensure that the option specified is valid for the socket.
7318	JROPTNAllow
	The option name specified is not allowed on getsockopt().
	Action: Check the option name provided. Re-issue the socket call with a option name that is valid for getsockopt().
7319	JRSockIPv6CommOnly
	The user is attempting to either bind or send to an IPv4 mapped IPv6 address on an AF_INET6 socket that only supports IPv6 communications.
	Action: If communication using IPv4 mapped IPv6 addresses is desired, the user should not set the IPv6_V6ONLY socket option.
731A	JRSockIPv6IPv4CommError
	The user is attempting to either send to an IPv4 mapped address when using an IPv6 native source address on an AF_INET6 socket or send to an IPv6 native address when using an IPv4 mapped source address on an AF_INET6 socket.
	Action: The user needs to decide on using either IPv4 mapped addresses or IPv6 native addresses for both source and destination.
731B	JRCmsgNotAllowed
	The ancillary data object provided on sendmsg() is not allowed on this type of socket.
	Action: Remove the ancillary data object and re-issue the sendmsg().
731C	JRCmsgHdrInvalid
	The information in the ancillary data object header, CMSGHDR, is not valid.
	Action: Correct the information in the header and re-issue sendmsg().
731D	JRPktInfo
	An error was found with the information in the in6_pktinfo structure or in the in_pktinfo structure provided on setsockopt() or sendmsg().
	Action: One of the following errors occurred: - The interface specified by ipi6_ifindex or ipi_ifindex does not exist ipi6_ifindex or ipi_ifindex specifies an interface but the address specified in field ipi6_addr or in field ipi_addr is not available for use on that interface No route to the destination exists over the interface specified by ipi6_ifindex or ipi_ifindex. Correct the information and re-issue the socket call.
731E	JRInvalidAddr
	The address specified is not a valid IPv6 Multicast address.
	Action: Re-issue the socket call with a valid IPv6 Multicast address.
731F	JRConnectBadSockAddr
	An invalid socket address structure was specified on connect().
	Action: Verify that all fields of the socket address structure are properly initialized.

Value	Description
7320	JRSockIPv6InvalidScopeId
	A nonzero scope value was determined to be incorrect.
	Action: A non-zero scope value was determined to be incorrect for one of the following reasons: - It was specified with an IP address which was not an IPv6 link-local address The IPv6 link-local address is not active on the interface identified by the scope An IPv6 interface was not found for the specified scope value The scope value specified with a source IP address does not match the scope of the destination IP address for a connected socket The Cinet Transport Index portion of the Scope_Id, the upper half word, does not match the target stack chosen by Stack Affinity or by the Transport Name supplied on BPX1PCT(PC#IsSrcAddr). Verify that the scope value has been specified with the correct IPv6 link-local address, and that the IPv6 interface associated with the scope value is still active.
7321	JRSockAddrLenInvalid
	The length provided for the AF_INET6 socket address structure is not valid.
	Action: Re-issue the socket call with a valid length for the AF_INET6 socket address structure.
7322	JRNOSYSPLEXPORT
	A sysplex wide port is not available for this source DRVIPA.
	Action: Wait a period of time and attempt the function call again
7323	JRINUSESYSPLEXPORT
	The port specified is already in use.
	Action: Either select another port or wait a period of time and attempt the function call again.
7324	JRNotAuthFRCA
	Userid is not authorized to access the TCP/IP FRCA service.
	Action: Userid must be given read permission to resource EZB.FRCAACCESS.sysname.tcpipname to access the stack successfully. sysname is the system image name and tcpname is the TCP/IP job name
7325	JrSocketNoPeer
	Socket is not connected and a datagram has not been successfully received (UDP/RAW).
	Action: Either establish a connection with the peer or if socket call was issued on a UDP or RAW socket, issue a a recvfrom() or recvmsg() to receive a datagram /*
7326	JRV6CKSUMOFFSET
	The user is attempting set the socket option IPPROTO_IPV6 IPV6_CHECKSUM with an odd value for the checksum offset.
	Action: Checksum values must be stored on an even boundary. The RAW user application must be changed specify an even offset when issuing this socket option. The protocol header must be changed to have the checksum field at an even offset from the start of the header.

Value	Description
7327	JRIPV6HOPLIMEXCEEDED
	TCP/IP has been configured with a maximum IPv6 Hop Limit of zero, which disallows any IPv6 packets from leaving the node.
	Action: The system administrator has set the IPv6 Hop Limit to zero (on the TCP/IP IPCONFIG6 statement). This disallows IPv6 communication with remote nodes, allowing IPv6 communication only among IPv6 applications running locally, on the same Z/OS node. Authorized applications can use one of the Hop Limit-related SetSockOpts to override the configured Hop Limit value.
7328	JRSOCKADDRPROVIDED
	The sockaddr provided for a send operation on a connectionless socket is different from the sockaddr provided on the connect.
	Action: Re-issue the socket call without a sockaddr.
7329	JRSPCFError
	Unable to associate the sysplexports distributed DVIPA with the EZBEPORT structure.
	Action: Display the contents of the EZBEPORT structure to determine if there are any available lists.
732A	JRIPV6ProtocolNotAllowed
	An IPV6 next header ID for an extension header cannot be specified as a socket protocol for an AF_INET6 socket.
	Action: Re-issue the socket call with a valid protocol.
732B	JRProtocolInvalid
	The protocol provided for a Raw socket is outside the allowable range.
	Action: Re-issue the socket call with a valid protocol.
732C	JRIOFailure
	Error status reported by the device driver as a result of an attempt to perform I/O.
	Action: Retry may be possible unless the device has been inactivated or taken offline, in which case re-establish connectivity with the device.
732D	JRSDQuiesce
	An attempt was made to bind to a distributed SYSPLEXPORTS DVIPA in Quiescing state.
	Action: Bind to a different address or configure the local stack to be a target again.
732E	JRIPSecNotAvail
	IP Security is not enabled on this stack.
	Action: Restart TCPIP specifying IPSECURITY on the IPCONFIG statement.
732F	JRNotAuthIPsec
	Userid is not authorized to issue the ipsec command.
	Action: Userid must be given read permission to resource EZB.IPSECCMD.sysname.tcpipname.DISPLAY or EZB.IPSECCMD.sysname.tcpipname.CONTROL. sysname is the MVS system image name and tcpname is the TCP/IP jobname.

Value	Description
7330	JRSockOptAccessDenied
	Userid is not authorized to the socket option.
	Action: Userid must be given read permission to resource EZB.SOCKOPT.sysname.tcpipname.optionname to use it successfully. sysname is the MVS system image name, tcpipname is the TCP/IP jobname and optionname is the option passed (eg: SO_BROADCAST)
7331	JrDVIPAInterfaceAlreadyDefined
	The Dynamic VIPA interface has already been defined via VIPADEFine or VIPABackup.
	Action: Correct the VIPARANGE statement.
7332	JRNotSpDrVipa
	An attempt was made to listen on a socket that is bound to a sysplex distributed DVIPA that is not using SYSPLEXPORTS, and a non-sysplex distributed port that was not user-specified.
	Action: Bind the socket to this DVIPA and a sysplex distributed or user-specified port, or reconfigure the distributed DVIPA to use SYSPLEXPORTS
7333	JRRtDestOnLocalHost
	Specified route destination is a local address of a non-DVIPA interface.
	Action: Specify a valid route destination.
7334	JRInvalidSRCIPAddr
	The source IP address that was defined by SRCIP is invalid.
	Action: Correct the SRCIP configuration statement.
7335	JrSRCIPIntNotDefined
	The interface name specified on a SRCIP configuration statement does not match any interface name defined on the local system.
	Action: Correct the SRCIP configuration statement to specify a valid interface name.
7336	JrSRCIPIntNoRoute
	The interface specified on a SRCIP configuration statement cannot be used as no route to the destination address exists.
	Action: Correct the SRCIP configuration statement to specify an interface that has a route to the destination address.
7337	JrConnDeniedPolicy
	A TCP connection request was denied due to policy.
	Action: Compare the connection request information against the policy to determine why the request was denied.
7338	JrNextHop
	The IPV6_NEXTHOP address is not valid.
	Action: Check the next hop address to see if it is valid. A direct route must exist to the address and it cannot be a multicast address.

Value	Description
7339	JrRoutingHeader
	An error occurred while processing the routing header on an IPV6_RTHDR socket option.
	Action: Ensure that none of the addresses are multicast addresses.
733A	JrRtHdrTooLong
	More than eight routing headers were specified.
	Action: Limit the number of routing headers on the socket option to eight or less.
733B	JrTtlsDecryptionFailed
	AT-TLS was unable to decrypt data received on a TCP connection.
	Action: Review message EZD1286I for more information about the error.
733C	JrTtlsEncryptionFailed
	AT-TLS was unable to encrypt data to be sent on a TCP connection.
	Action: Review message EZD1286I for more information about the error.
733D	JrTtlsHandshakeFailed
	AT-TLS was unable to successfully negotiate a secure TCP connection with the remote end.
	Action: Review message EZD1286I for more information about the error.
733E	JrTtlsControlDataFailed
	AT-TLS was unable to process secure control data received over a TCP connection from the remote partner.
	Action: Review message EZD1286I for more information about the error.
733F	JrTtlsResetSessionFailed
	AT-TLS received an error resetting the session ID for the secure connection.
	Action: Review message EZD1286I for more information about the error.
7340	JrTtlsResetCipherFailed
	AT-TLS received an error attempting to generate new session keys for a secure connection.
	Action: Review message EZD1286I for more information about the error.
7341	JrTtlsAbendRecovery
	An abend occurred in AT-TLS causing the secure connection to be reset.
	Action: Review the system log for more information about the abend.
7342	JrTtlsGroupDeleted
	AT-TLS reset a TCP connection because the group the connection was mapped to has been deleted.
	Action: A connection was received while the TTLSGroupAction was being deleted. Retry the connection.

Value	Description
7343	JrTtlsClearTxtReceived
	AT-TLS received clear text data when secure data was expected.
	Action: Enable the remote application for secure connections. Retry the connection.
7344	JrPortNonZero
	The port value is required to be zero.
	Action: Check the value specified for port. The port value is required to be zero for this operation.
7345	JrPortZero
	The port value is required to be nonzero.
	Action: Check the value specified for port. The port value cannot be zero for this operation.
7346	JRSockIPv6OnlyOption
	The user is attempting to use an IPv4 mapped IPv6 address with an IPv6 only socket option.
	Action: If communication using IPv4 mapped IPv6 addresses is desired, the user should not set the IPv6_V6ONLY socket option. If an IPv6 socket option that does not support IPv4 mapped IPv6 addresses is being used, a IPv4 mapped IPv6 address cannot be used.
7347	JRSRCIPDistDVIPA
	The source IP address defined by a DESTINATION entry in a SRCIP configuration statement cannot be a distributed DVIPA.
	Action: Correct the SRCIP configuration statement.
7348	JRDuplicateSmoAttach
	The shared memory object is already attached.
	Action: Correct the application to issue SIOCSMOCTL Attach requests on only one socket and only from one process thread.
7349	JRSmoNotAttached
	The shared memory object is not attached.
	Action: Correct the application to issue SIOCSMOCTL Detach requests only for share memory objects that have been successfully attached.
734A	JRIARV64Error
	IARV64 encountered an error.
	Action: Use the return and reason code values returned by the following functions to determine the cause of the error:
	The SIOCSMOCTL ioctl function call.
	<ul> <li>The z/OS Communications Server Real-time application-controlled TCP/IP trace NMI request.</li> </ul>

Value	Description
734B	JrNoRouteTable
	Specified route table does not exist on the TCP/IP stack.
	Action: Specify a valid route table.
734C	JrExpBndPortRangeConflict
	An explicit bind to a port within the active EXPLICITBINDPORTRANGE is not allowed.
	Action: Specify a port that is not within the active EXPLICITBINDPORTRANGE or ask the system programmer or system administrator to change the range specified by GLOBALCONFIG EXPLICITBINDPORTRANGE.
734D	JRMCPairNotFound
	The specified multicast group and interface pair are not found.
	Action: Specify correct multicast group or interface.
734E	JRMCMixedOpt
	The specified multicast option is mixed of any-source, source-specific or full-state APIs.
	Action: Sockets do not allow mix IPv4 protocol with protocol independent group membership APIs and within each API type may not mix delta based with full state options. Correct the usage of API type.
734F	JRMCMaxSrcFlt
	The maximum number of source addresses per group and interface pair has been exceeded.
	Action: Remove source addresses that are no longer needed.
7350	JRMCDupSrcFlt
	The same source address is already in the group and interface.
	Action: Verify the address being used. Correct it and re-issue API command.
7351	JRMCEmptySrcIncMode
	The empty source list can not be specified for mode INCLUDE when the multicast group is not yet defined.
	Action: VERIFY THAT THE FILTER MODE IS CORRECT OR add source addresses with this API command.
7352	JRMCModeInvalid
	The filter mode specified for multicast source function when the multicast group is not yet defined.
	Action: Correct the filter mode. Only MCAST_INCLUDE and MCAST_EXCLUDE ARE ALLOWED.
7353	JRMCGetSrcInvalid
	THE MULTICAST GROUP AND INTERFACE ARE NOT YET DEFINED for get source filter function.
	Action: Specify correct multicast group or interface.

Value	Description
7354	JRMCSrcAddrInvalid
	The specified source address is not valid.
	Action: Specify correct source address.
7355	JRCmMultipleCaches
	Cache Manager cannot be configured for both a shared and an exclusive cache.
	Action: Reconfigure the Cache Manager for this server socket or reissue the socket call later.
7356	JRCmChangeCacheType
	Cache Manager cannot be reconfigured for a different type of cache.
	Action: Reconfigure the Cache Manager for this server socket or reissue the socket call later.
7357	JRUWSXStorageFailed
	Cache Manager encountered storage shortage.
	Action: See your IBM service representative.
7358	JRCmBadCacheType
	Cache type specified on request does not match the configured cache type.
	Action: Reconfigure the Cache Manager for this server socket or reissue the socket call later.
7359	JRDVQuiesce
	An attempt was made to bind to a distributed DVIPA in Quiescing state.
	Action: Bind to a different ip address or configure the local stack to be a target again.
735A	JrUnRsvdPortDenied
	Application does not have PORT statement UNRSV authority to access a port that is not reserved by a PORT or PORTRANGE profile statement.
	Action: Job must be given permission by a PORT statement in the TCP/IP profile. Either create a port reservation allowing the application access to the requested port, or create a PORT UNRSV definition allowing the job to access unreserved ports.
735B	JrNotAuthUnRsvdPort
	Userid was refused SAF authorization to access a port that is not reserved by a PORT or PORTRANGE profile statement.
	Action: Either define a PORT reservation statement allowing the application to access the specified port, or the userid must be given read permission to resource EZB.PORTACCESS.sysname.tcpipname.safname. safname is defined on the TCP/IP PORT UNRSV statement. sysname is the MVS system image name and tcpname is the TCP/IP jobname.

Value	Description
735C	JrUnRsvdTCPPortConflict
	WHENBIND and WHENLISTEN cannot be specified concurrently by PORT UNRSV TCP profile statements.
	Action: Verify the access control (WHENBIND or WHENLISTEN) to be used for TCP. To change the access control, delete and reconfigure all existing PORT UNRSV TCP profile statements.
735D	JrNoCritSocks
	No critical sockets are available to satisfy the request.
	Action: Application is trying to use an unsupported function, please contact IBM Service.
735E	JrNoPartnerInfo
	No partner information is returned for the request.
	Action: Verify if the correct socket descriptor has been used for the request, or that both end points of the connection does not reside in the same image or in the same sysplex.
735F	JrInValidTCPIPStack
	The application tried to use a function which is not supported by this TCPIP stack.
	Action: Make sure that the correct level of TCPIP stack is used.
7360	JrNotSameSecDomain
	Both end points of the connection does not reside in the same security domain.
	Action: Make sure that both end points of the connection reside in the same security domain. May need to invoke the SERVAUTH to define the security domain.
7361	JrNoSecDomain
	The socket call fails because the security domain name for the profile in the SERVAUTH class is not defined.
	Action: Make sure to define the security domain name for the profile in the SERVAUTH class.
7362	JrNoSuspend
	The socket call fails because the socket call is issued in no-suspend mode and there is no information available to be returned.
	Action: The application may want to issue the socket call with a timeout value to suspend the socket call to retrieve the information.
7363	JRSockIPv6InvalidScopeIdZero
	A zero scope id is not valid for use with the scope of this address.
	Action: The socket function requires a non-zero scope id in the sockaddr structure. The if_nameindex function can be used to obtain interface indices for use as scope ids for link-local IPv6 addresses.

Value	Description
7364	JROSMAccessDenied
	The user is not permitted to communicate over OSM interfaces.
	Action: If access to the intranode management network over OSM interfaces is required, the user must be permitted to the appropriate SAF resource.
7365	JRDisabled
	The function is currently disabled.
	Action: Determine why the function is disabled and then retry the request.
7366	JRCallerMismatch
	The authorization of the current caller of the request does not match that of the caller that initialized the function.
	Action: Retry the request from a caller with the correct authorization. This error may be returned for the following reasons:
	<ul> <li>z/OS CS Real-time application-controlled TCP/IP trace NMI:</li> </ul>
	<ul> <li>For all requests except RCCGetRecords, the task, address space (ASID), or user ID of the caller of the request does not match that of the caller of the RCCOpen request.</li> </ul>
	<ul> <li>For the RCCGetRecords request, the address space (ASID) or user ID of the caller of the request does not match that of the caller of the RCCOpen request.</li> </ul>
7367	JRTooManyInstances
	The maximum number of function instances is already open.
	Action: Retry the request later. This error may be returned for the following reasons:
	<ul> <li>z/OS CS Real-time application-controlled TCP/IP trace NMI:</li> </ul>
	<ul> <li>An RCCOpen request was received, but the maximum number of trace instances is already open.</li> </ul>
7368	JROutOfSequence
	The current request does not follow the correct request sequence for the function.
	Action: Retry the requests in the correct sequence. This error may be returned for the following reasons:
	<ul> <li>z/OS CS Real-time application-controlled TCP/IP trace NMI:</li> </ul>
	<ul> <li>An RCCSetFilters request was received but the trace instance is still active. Invoke the RCCStop request to stop the trace before invoking the RCCSetFilters request.</li> </ul>
	<ul> <li>An RCCStart request was received but either no filters have been specified for the trace instance, or the trace instance is already active.</li> </ul>
	<ul> <li>An RCCStop request was received for a trace instance where a trace is not currently active.</li> </ul>
7369	JRTcpGlobalStall
	The TCP connection has been reset due to a global stall.
	Action: Determine why the global stall occurred and then restart the connection.

Value	Description
736A	JRTcpQueueSize
	The TCP connection has been reset due to a queue size problem.
	Action: Determine why the queue size problem occurred and then restart the connection.
736B	JRSrcIPInvalidForExternalDest
	The TCP connect source IP address is not valid because the non-z/OS external target for the GRE or ENCAP Distributed VIPA does not have a route back to this address. It will not be able to return the syn ack to the client.
	Action: The client application should use a source IP address that is routable by the non-z/OS external target of the GRE or ENCAP Distributed DVIPA. If the client application bind is to inaddr_any or it uses an implicit bind, you can use the SRCIP statement to select an appropriate source IP address for the application.
736C	JRTTLSStopReadDataPending
	The AT-TLS SIOCTTLSCTL TTLSi_Stop_Connection ioctl request can not complete because all of the decrypted data was not read from the socket. All application data received over the secure connection must be read prior to the security stopping on the connection.
	Action: The application should read any outstanding data on the connection. Then the SIOCTTLSCTL TTLSi_Stop_Connection ioctl can be used to stop the security on the connection.
736D	JRTTLSStopWriteDataPending
	The AT-TLS SIOCTTLSCTL TTLSi_Stop_Connection ioctl request can not complete because application write data is pending to be encrypted on the connection. All application write requests must be completed prior to the security stopping on the connection.
	Action: The application should wait for any outstanding write requests to complete on the connection. Then the SIOCTTLSCTL TTLSi_Stop_Connection ioctl can be used to stop the security on the connection.
736E	JRInvalidFilter
	The filter identifier is wrong or the filter specified is not valid for obtaining FTP daemon configuration. The filter only supports the address space id (ASID) item.
	Action: Retry the GetFTPDaemonConfig request, providing one filter that specifies only the ASID that identifies the specific FTP daemon.
736F	JrDVIPAServicesNotActive
	Dynamic VIPA services are not available at this time. This situation can occur when TCP/IP has not joined the sysplex, has left the sysplex, or has not completed processing the initial profile.
	Action: Try the request again. If this condition persists, contact the system programmer.
7370	JrTtlsResetWriteCipherFailed
	AT-TLS received an error while attempting to generate a new write session key for a secure connection.
	Action: Review message EZD1286I for more information about the error.

Value	Description
7371	JrTtlsSendSessionTicketFailed
	AT-TLS received an error while attempting to send a session ticket to the client for a secure connection.
	Action: Review message EZD1286I for more information about the error.

# **zFS** reason codes

Reason codes beginning with EF (as in EFxxrrrr) are documented in EFxxrrrr reason codes in z/OS File System Messages and Codes.

### **TFS** reason codes

The structure of a TFS reason code is *xxyynn*, where: XX Is E3 УУ Indicates the error source and *nnnn* is the qualifier. **TFS E2** SAF. nnnn is the second halfword of the IARV64 reason code. IARV64 reason codes are documented in z/OS MVS System Codes in the ABEND code DC2 section. The TFS reason code qualifiers are listed as follows: 1 (Mount by DD name is not allowed.) 2 (The PFSCTL buffer is too large.) 3 (No information is available.) 4 (No information is available.) 5 (No information is available.) 6 (No information is available.) 7 (No information is available.) 8 (The PFSCTL command is not valid.) 9 (FID was not found on vget.) A (TFS does not support remount.) B (Invalid object for access call.) C (Create only allowed in directories.) D (Create not allowed in removed directories.) E (Invalid file type for create.) F (Create failed: no more space.) 10 (Create failed: file already exists.) 11 (Trunc only allowed on regular files.) 12 (Trunc will cause the file size to exceed maximum supported size.) 13 (ioctl failed because the file node was not found.) 14 (setfacl failed: ACLs are not enabled on this system.) 15 (The ACL entry was not found.) 16 (getfacl failed: ACLs are not enabled on this system.) 17 (The ACL is too large.) 18 (The ACL entry was not found.) 19 (The ACL was not valid.) 1A (link failed: name already exists.) 1B (link failed: out of space creating new name.) 1C (The file was not found.) 1D (mkdir failed: parent directory was removed.) 1E (mkdir failed: the file already exists.) 1F (mkdir failed: out of space creating directory.)

20 (mkdir failed: out of space adding new name.)

24 (open is not allowed on TFS directories. Use opendir instead.)

21 (open failed: invalid file identifier.)22 (open failed: invalid file identifier.)23 (open failed: invalid open mode.)

- 25 (readdir failed.)
- 26 (write failed: only allowed on regular files.)
- 27 (write failed: no file extends when new files not be created.)
- 28 (write failed: no more space.)
- 29 (write failed: file too large.)
- 2A (write failed: the file size exceeded process limits.)
- 2B (read failed: read past file size limit.)
- 2C (readlink failed: the read length was invalid.)
- 2D (remove failed: the errno describes the failure.)
- 2E (rename failed: the errno describes the delete failure on the old name.)
- 2F (rename failed: the file does not exist.)
- 30 (rename failed: directory not empty.)
- 31 (rename failed: no more space.)
- 32 (rmdir failed: the errno describes the failure.)
- 33 (setattr failed: trunc is only allowed on regular files.)
- 34 (setattr failed: the file exceeded maximum file size.)
- 35 (symlink failed: the directory has been removed.)
- 36 (symlink failed: the name already exists.)
- 37 (symlink failed: no more space.)
- 38 (symlink failed: length error.)
- 39 (Insufficient authorization for the pfsctl function.)

# Chapter 4. Exit status codes for /usr/sbin/init

The ETCINIT job, /usr/sbin/init, provides exit status codes.

If /usr/sbin/init does not detect an error and the shell returns normally after executing the initialization script, /usr/sbin/init exits with status code 00.

If /usr/sbin/init detects an error or if the shell abnormally terminates, /usr/sbin/init exits with a two-digit, nonzero, hexadecimal status code, z/OS UNIX displays the nonzero /usr/sbin/init exit status on the operator console with the following message:

```
BPXI027I THE ETCINIT JOB ENDED IN ERROR, EXIT STATUS 0000ss00
```

If the exit status shown is not of the form 0000ss00, but is of the form 000000x, then the exit status was not set by the /usr/sbin/init process. In the form 000000x, x is the signal number of the signal that ended the /usr/sbin/init process. If the status is 00000009, for example, the /usr/sbin/init process was ended by a SIGKILL signal. The SIGKILL signal might be the result of an abend.

Even if /usr/sbin/init exits with status 00, the shell might not have successfully executed the initialization script. To find out whether it did, look at the /etc/log file, which contains standard output and error messages that are written by /usr/sbin/init, the shell, and initialization script commands.

Even if /usr/sbin/init exits before invoking the shell or if the shell does not successfully execute the initialization script, z/OS UNIX makes the system available to all batch and interactive users when /usr/sbin/init exits.

Table 3 on page 1163 lists the exit status codes, ss, set by /usr/sbin/init when it exits due to an error.

Table 3. Exit status codes for /usr/sbin/init (in hexadecimal)

Exit status	Explanation	Action to take
01	Wrong process ID	The process ID of /usr/sbin/init indicates that it was not invoked by z/OS UNIX during START OMVS command processing. To run /usr/sbin/init, z/OS UNIX must be stopped and restarted. The system continues.
02	Wrong group ID	The setsid() request that is issued by /usr/sbin/init failed to return the expected group ID. Contact your system programmer. The system continues.
03	No storage	A malloc() request that is issued by /usr/sbin/init failed to allocate requested storage. Contact your system programmer. The system continues.
04	No shell	The shell with the path name that is specified in the /etc.init options file is not accessible. Contact your system programmer to correct the path name that is specified in the /etc.init options file. The system continues.
05	No script	The initialization script with the path name that is specified in the /etc.init options file is not accessible. Contact your system programmer to correct the path name specified in the /etc.init options file. The system continues.
06	Bad block	The sigprocmask() request by /usr/sbin/init to block signals failed. Contact your system programmer. The system continues.

Table 3. Exit status codes for /usr/sbin/init (in hexadecimal) (continued)

Exit status	Explanation	Action to take
07	No alarm	The sigaction() request by /usr/sbin/init to install the SIGALRM signal catcher failed. Contact your system programmer. The system continues.
08	No stdin	/usr/sbin/init could not open /dev/null for standard input. Contact your system programmer. The system continues.
09	No stdout	/usr/sbin/init could not open /etc/log for standard output. Contact your system programmer. The system continues.
		/usr/sbin/init attempts to erase and re-create /etc/log each time that it is run.
0A	No stderr	/usr/sbin/init could not open /etc/log for standard error. Contact your system programmer. The system continues.
0B		Reserved.
0C		Reserved.
0D	Write error	/usr/sbin/init could not write to /etc/log after opening it. Contact your system programmer. The system continues.
0E	Fork failed	The fork() request by /usr/sbin/init to create a process for the shell failed. Contact your system programmer. The system continues.
0F	Wait failed	The waitpid() request by /usr/sbin/init to wait for the shell process failed. Contact your system programmer. The system continues.
10	Timeout	/usr/sbin/init timed out waiting for the shell to finish executing the initialization script. /usr/sbin/init attempts to terminate the shell process group with SIGKILL signal before exiting if the terminate option was specified in the /etc.init options file. The system continues.
11	Shell terminated	The shell was abnormally terminated by a terminating event such as an asynchronous signal. Contact your system programmer. The system continues.
12	Shell stopped	The shell was stopped by an unexpected SIGSTOP signal. Contact your system programmer. The system continues.
13	Notify failed	/usr/sbin/init could not send a SIGSTOP signal to tell z/OS UNIX that the shell finished executing the initialization script. Contact your system programmer. The system continues.
14	ARG_MAX	/usr/sbin/init determined that the number of parameter bytes required for the execve() request to invoke the shell exceeded the ARG_MAX value which /usr/sbin/init obtained with a sysconf(_SC_ARG_MAX) request. Contact your system programmer. The system continues.
15	ENV_MAX	/usr/sbin/init found that more than 25 environment variables were specified in the /etc.init options file. Contact your system programmer. The system continues.
16	Bad Unblock	The sigprocmask() request by /usr/sbin/init to unblock signals for the shell process failed. Contact your system programmer. The system continues.

Table 3. Exit status codes for /usr/sbin/init (in hexadecimal) (continued)

Exit status	Explanation	Action to take
17	Bad Execve	The execve() request by /usr/sbin/init to invoke the shell failed. Contact your system programmer. The system continues.

# **Appendix A. Accessibility**

Accessible publications for this product are offered through IBM Documentation for z/OS (www.ibm.com/docs/en/zos).

If you experience difficulty with the accessibility of any z/OS documentation see  $\underline{\text{How to Send Feedback to}}$  IBM to leave documentation feedback.

### **Notices**

This information was developed for products and services that are offered in the USA or elsewhere.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive, MD-NC119
Armonk, NY 10504-1785
United States of America

For license inquiries regarding double-byte character set (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Intellectual Property Licensing Legal and Intellectual Property Law IBM Japan Ltd. 19-21, Nihonbashi-Hakozakicho, Chuo-ku Tokyo 103-8510, Japan

The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law: INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

This information could include missing, incorrect, or broken hyperlinks. Hyperlinks are maintained in only the HTML plug-in output for IBM Documentation. Use of hyperlinks in other output formats of this information is at your own risk.

Any references in this information to non-IBM websites are provided for convenience only and do not in any manner serve as an endorsement of those websites. The materials at those websites are not part of the materials for this IBM product and use of those websites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

IBM Corporation Site Counsel 2455 South Road Poughkeepsie, NY 12601-5400 USA

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

#### COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. The sample programs are provided "AS IS", without warranty of any kind. IBM shall not be liable for any damages arising out of your use of the sample programs.

### **Terms and conditions for product documentation**

Permissions for the use of these publications are granted subject to the following terms and conditions.

### **Applicability**

These terms and conditions are in addition to any terms of use for the IBM website.

#### Personal use

You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

#### Commercial use

You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or

reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

### **Rights**

Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

## **IBM Online Privacy Statement**

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information about this offering's use of cookies is set forth below.

Depending upon the configurations deployed, this Software Offering may use session cookies that collect each user's name, email address, phone number, or other personally identifiable information for purposes of enhanced user usability and single sign-on configuration. These cookies can be disabled, but disabling them will also eliminate the functionality they enable.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Policy at ibm.com®/privacy and IBM's Online Privacy Statement at ibm.com/privacy/details in the section entitled "Cookies, Web Beacons and Other Technologies," and the "IBM Software Products and Software-as-a-Service Privacy Statement" at ibm.com/software/info/product-privacy.

## **Policy for unsupported hardware**

Various z/OS elements, such as DFSMSdfp, JES2, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

### **Minimum supported hardware**

The minimum supported hardware for z/OS releases identified in z/OS announcements can subsequently change when service for particular servers or devices is withdrawn. Likewise, the levels of other software products supported on a particular release of z/OS are subject to the service support lifecycle of those

products. Therefore, z/OS and its product publications (for example, panels, samples, messages, and product documentation) can include references to hardware and software that is no longer supported.

- For information about software support lifecycle, see: <a href="IBM Lifecycle Support for z/OS">IBM Lifecycle Support for z/OS (www.ibm.com/software/support/systemsz/lifecycle)</a>
- For information about currently-supported IBM hardware, contact your IBM representative.

### **Trademarks**

IBM, the IBM logo, and ibm.com are trademarks or registered trademarks of International Business Machines Corporation in the United States, other countries, or both. If these and other IBM trademarked terms are marked on their first occurrence in this information with a trademark symbol (° or ™), these symbols indicate U.S. registered or common law trademarks owned by IBM at the time this information was published. Such trademarks may also be registered or common law trademarks in other countries. A current list of IBM trademarks is available on the Web at Copyright and Trademark information (www.ibm.com/legal/copytrade.shtml).

UNIX is a registered trademark of The Open Group in the United States and other countries.

# **Acknowledgments**

InterOpen/POSIX Shell and Utilities is a source code product providing POSIX.2 (Shell and Utilities) functions to z/OS UNIX System Services. InterOpen/POSIX Shell and Utilities is developed and licensed by Mortice Kern Systems (MKS) Inc. of Waterloo, Ontario, Canada.
